5023. Donovan, John C., Salzman, Leonard F., & Allen, Peter Z. (U. Rochester, Medical & Dental School) **Patterns of learning in medical school.** *Journal of Medical Education*, 1969(Jul), Vol. 44(7), 589-594.—Presents increments and decrements of factual knowledge among 7 classes of medical students over a 5-yr period. The National Board of Medical Examiners "Minitest," which consists of 360 questions equally divided among 6 preclinical and 6 clinical disciplines, was employed as the test instrument. Results show that: (a) in all classes the increment in both basic and clinical science knowledge during each preclinical yr. was statistically significant ($p < .001$); (b) no class exhibited a significant decrement in basic science knowledge during the junior yr., an entirely clinical yr.; and (c) statistically significant decrements in basic science knowledge occurred during the senior yr. Implications of results for possible curriculum changes are discussed. A possible deficit in the study, i.e., introduction of a new curriculum in the 3rd yr. of the study making it

impossible to collect comparable base-line data from all classes, is noted.—*M. Maney.*

5024. Edelstein, Gerald. (Columbia U.) **Delay of gratification and school achievement.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 392-393.

5025. Fekart, Mohammad A. (Indiana U.) **A correlational study between self-concept and academic achievement of college freshmen and seniors.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5283-5284.

5026. Frender, Robert; Brown, Bruce, & Lambert, Wallace E. (Harvard U.) **The role of speech characteristics in scholastic success.** *Canadian Journal of Behavioural Science*, 1970(Oct), Vol. 2(4), 299-306. —Compared 2 groups of 93 French-Canadian 3rd grade boys in terms of verbal intelligence and various characteristics of speech. Ss in both groups came from low social class homes, and were similar in measured nonverbal intelligence. The essential difference between groups was school achievement; 1 group had average grades of B or above, the other, C or below. It was found that the groups differed reliably in verbal intelligence and in particular speech characteristics, analyzed by an experienced linguist. Distinctive patterns of speech differentiated the 2 groups even with verbal intelligence statistically controlled. Results are discussed in terms of current psycholinguistic theories of social-class differences in speech and language. (French summary) —*Journal abstract.*

5027. Glynn, E. L. (U. Toronto, Ontario, Canada) **Classroom applications of self-determined reinforcement.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 123-132. —Compared self-determined, E-determined, and chance-determined token reinforcement treatments with a no-token treatment, in terms of effect on the learning of history and geography material in the classroom. Each treatment was assigned to 1 of 4 heterogeneous classes of 9th grade girls. An initial base-line period preceded the differential reinforcement period, and a token withdrawal period followed. Subsequently, the self-determined treatment was employed in all 3 token reinforcement classes, before a final base-line period occurred. Findings include a similarity of initial base-line performance for all classes, an equal superiority of self-determined and E-determined treatments to chance-determined and no-token treatments, and significant improvement from initial base line to final base line for self-determined and E-determined treatments, but not chance-determined and no-token treatments. Differential token reinforcement experience was found to influence subsequent rate of self-determined token reinforcement.—*Journal abstract.*

5034. Khan, S. B. (Ontario Inst. for Studies in Education, Toronto, Canada) **Dimensions of manifest anxiety and their relationship to college achievement.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 223-228. —Investigated the hypothesis regarding the multidimensionality of the MA scale and the relationships between the emerged dimensions and college achievement. The scale was administered to 153 male and 107 female freshman undergraduates using a 5-point response scale. The Pearson product-moment correlations were factor analyzed for males and females separately. Factors common to both sexes are tension-anxiety, personal inadequacy, and agitation. Factors for males are hysteria and psychosomatic fitness. Factors for the females are interpreted to be inner tension and betrayal of inner self. Factor scores were correlated with GPA for 123 males and 90 females. Only the correlation between psychosomatic fitness and grades for males was significant. The multiple correlations between the optimal combination of the 3rd, 4th, and 5th factors and grades were .325 and .263 for males and females, respectively.—*Journal abstract.*

5040. Matell, Michael S. & Smith, Ronald E. (Purdue U.) **Approval motive and academic behaviors: The self-reinforcement hypothesis.** *Journal of Consulting & Clinical Psychology*, 1970(Oct), Vol. 35(2), 229-232. —Administered 2 course examinations under conditions differing in the degree to which performance was relevant to academic achievement goals to 60 undergraduates. Under high-relevance conditions, scores on the Marlowe-Crowne Social Desirability scale were unrelated to test performance. Under low-relevance conditions, however, need for approval was highly related to performance in high- and moderate-ability groups, but not in a low-ability group. In view of the absence of extrinsic approval incentives, the results are discussed in terms of a hypothesis that the approval motive cues of classes of behaviors which have been reinforced by the approval of others in the past, but which are currently reinforced and maintained through self-reinforcement.—*Journal abstract*.

5041. Meritt, Ray. (Delta State Coll.) **Academic performance of work-study students.** *Journal of College Student Personnel*, 1970(May), Vol. 11(3), 173-176.—Attempted to compare the GPAs of students employed on the Federal Work-Study Program with those of students who are members of social fraternities or sororities (i.e., Greeks). The sample consisted of 204 Work-Study students and 143 Greeks. A comparison was made between the composite American College Test (ACT) score of each group and the 1st semester GPA of each group. The Greeks had a significantly higher mean ACT score than did the Work-Study Ss, however, when the GPAs of each group were compared, no significant difference was obtained. This finding corroborates those of earlier studies and suggests the idea that economically deprived students who receive an opportunity to attend college tend to compensate for their shortcomings and work more diligently. It is also considered that the Work-Study student may be a special kind of person.—R. H. Mueller.

5054. Zink, Blanche P. (Loyola U., New Orleans, La.) **Is lip movement so bad?** *Catholic Educator*, 1970, Vol. 40(8), 38-40.—14 sections of white 4th grade children of middle status in 5 elementary schools furnished the reservoir from which those children who attained 90-110 IQ on the California Short-Form Test of Mental Maturity were selected. Reading level was determined by results of the Reading Comprehension test of the Iowa Tests of Basic Skills. "Easy" material used in the test had readability level about 1 yr. below the pupil's reading level; "difficult" material was approximately the same as the pupil's reading level. Skin-lip electrodes recorded the electrical activity during silent reading. Findings showed a significant (.01) relationship between reading achievement and lip movement; also between difficulty of reading material (.05) and lip movement. There were no significant differences in incidence of lip movement between boys and girls.—A. M. Cawley.

Prediction

5055. Giebink, John W. & Birch, Robert. (U. Wisconsin) **The Bender Gestalt Test as an ineffective predictor of reading achievement.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 484-485.—Correlations between the Bender-Gestalt Test scores and Metropolitan Readiness Tests scores on 2nd graders were nonsignificant. The results suggested caution in putting diagnostic importance to perceptual motor factors in reading.—E. J. Kronenberger.

5056. Gross, Morris B. (Lehman Coll., City U. New York) **Pre-school prediction of academic achievement.** *Psychological Reports*, 1970(Feb), Vol. 26(1), 278.—Studied the complete elementary school records of

43 students to determine the stability of achievement performance, factors associated with academic achievement, and the feasibility of identifying scholastic aptitude before 1st grade entrance. It was found that a pattern of achievement is set before formal schooling begins and remains fairly consistent through the 8th grade. The correlation between IQ and achievement was high and education-mindedness of the home was related to achievement.—*Author abstract.*

5057. Hutton, Jerry B. (U. Houston) **Relationships between preschool screening test data and first grade academic performance for Head Start children.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 395.

5058. Lester, Eva P., Muir, R., & Dudek, Stephanie Z. (Allan Memorial Inst., Montreal, Quebec, Canada) **Cognitive structure and achievement in the young child.** *Canadian Psychiatric Association Journal*, 1970(Jun), Vol. 15(3), 279-287.—Reports recent findings from a longitudinal study with 100 middle-class kindergarten children on early school learning which indicates that the Piaget measures of cognitive functioning at the kindergarten level are reliable predictors of achievement in Grades I and II. Their predictive value remains statistically significant even after the IQ effect is partialled out. A combined test including the best Piaget subtest (Seriation and Time) with the Picture Arrangement from the WISC and the total score from the Lincoln Osseretsky (Motor Development test), when administered at kindergarten, gives a surprisingly high prediction for achievement at Grades I and II. Significance of these findings is discussed. It is suggested that the Piaget tests at this level tap an important dimension of development, possibly that related to individuation and ego autonomy. (French summary)—*Journal summary.*

5059. Romine, Ben H., Davis, Junius A., & Gehman, W. Scott. **The interaction of learning, personality traits, ability, and environment: A preliminary study.** *Educational & Psychological Measurement*, 1970(Sum), Vol. 30(2), 337-347.—Peterson's College Student Questionnaire, Part I (CSQ-I), was administered to 250 female freshmen at a college in the 98th percentile of Pace's College and University Environment Scales (CUES). The schools were matched on several Astin variables. The regression between predicted GPA and actual GPA was found. At both campuses Ss were classified high, moderate, or low independent on the basis of their CSQ-I scores. Tests of significance between errors of estimate, slope, and intercepts revealed that at the "supportive" campus a dependent student would earn a higher GPA than an independent student of the same ability. At the impersonal campus a high ability dependent student outperformed the independent student of the same ability, but the independent low ability student outperformed the dependent one in that college environment.—*N. M. Chansky.*

Overachievement & Underachievement

5063. Smith, Charles P. & Winterbottom, Miriam T. (City Coll., City U. New York, Graduate Center) **Personality characteristics of college students on academic probation.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 379-391.—In 2 separate studies underclassmen on academic probation (Ns = 27 and 22) were individually matched for aptitude with academically satisfactory students to investigate (a) nonaptitudinal factors differentiating probation students from matched students, and (b) how probation students who eventually have to withdraw differ from those who improve. Results based on interviews, questionnaires, and self-report measures indicate that probation students have unrealistically optimistic expectations concerning grades, attribute their difficulties to academic factors rather than personal concerns, and tend to be defensive, lacking in positive motivation for academic work, and relatively dependent on their parents. Students most likely to get off probation estimated their grades most accurately and had lowest test anxiety.—*Journal summary.*

Skola, 1969(Feb), Vol. 21(2), 133-148.—Deals with problems of content and structure of material taught from the viewpoint of personality psychology, development of the pupils' cognitive sphere, and the individual psychological differences among pupils. It is suggested that, with regard to content, there has been a 1-sided stress on development of the cognitive sphere and a neglect of development of the motivating moments in the pupils' personality. The need for developing the thinking process and rational abilities is stressed. Attributes of knowledge: content, informativity, and standard of generality and organization, are defined with greatest value assigned to systematic arrangement of knowledge. From the viewpoint of teaching, the greatest significance is assigned to abilities and interests of pupils, and a survey showing 5 fundamental aims of interest which should be taken into account in the differentiation of the teaching process is presented. (Russian summary)—*English summary*.

5108. Merrill, Irving R., et al. (U. California, Medical School, San Francisco) **Effectiveness of motion pictures at different stages of learning history-taking.** *Journal of Medical Education*, 1969(Jul), Vol. 44(7), 595-603.—Hypothesized that: (a) learning about patient history-taking from films varies according to which of 4 angles—subjective (patient only), O (physician only), lateral (both patient and physician), and combined (both patient and physician full face simultaneously on a split screen)—is used; and (b) visual information is most effective if presented in an abstract form during initial learning stages and in a detailed realistic manner during later stages. 8 film treatments were varied for 88 2nd yr. medical students at 2 stages of learning. In an independent study with 131 medical students, the relative contribution of the lecture and demonstration segments to learning were measured. Results on a 60-item test of learning and a questionnaire of perceived learning and enjoyment indicate that: (a) the 1st hypothesis was not supported, however, O and subjective angles led to slightly greater learning achievement; (b) there was strong support for the 2nd hypothesis; and (c) there was a highly significant positive relation between perceived enjoyment and perceived learning.—*M. Maney.*

5109. Mitchell, Merlin M. (Indiana U.) **The effect of augmented information feedback upon the performance of a motor skill by persons of differing perceptual ability.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 303-304.

(Indiana U.) **Come hither, come hither, come hither: Black is indeed beautiful!** *Gifted Child Quarterly*, 1970(Sum), Vol. 14(2), 76-81.—Presents a bibliography for black children. The books and stories are chosen so as to enhance the positive self-image of black pupils.—*S. Krippner.*

5111. Schuck, Robert F. **A determination of the influence of set induction upon pupil perception of effective teaching, achievement, and retention in a unit on respiration in the BSCS curricula.** *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 228-231.—The effect of set induction techniques on 9th graders studying a unit of work in the Biological Sciences Curriculum Study (BSCS) was appraised through a series of achievement tests. Pupils taught by set induction performed significantly different from those exposed to more traditional methods. Teachers in the experimental group received statistically significant higher ratings on the Teacher Demonstration form than did the teachers in the control group.—*H. Kaczkowski.*

5112. Schuck, Robert F. **A social psychological**

view of large group instruction. *Psychology in the Schools*, 1970(Jul), Vol. 7(3), 296-303.—This review of the social psychological aspects of team teaching suggests that this mode of instruction ignores the social and psychological aspects of the individual learner. It is suggested that the Getzles and Thelen model can generate a balance between institutional demands and individual need dispositions.—*H. Kaczkowski.*

5113. Schutte, R. C. & Hopkins, B. L. (Southern Illinois U.) **The effects of teacher attention on following instructions in a kindergarten class.** *Journal of Applied Behavior Analysis*, 1970(Sum), Vol. 3(2), 117-122.—In each of 20 daily sessions, a sequence of 10 simple instructions was given to a kindergarten class with 5 4-6 yr. old girls. In base-line sessions, the teacher did not interact with Ss, other than to give instructions. During these sessions, Ss followed the teacher's instructions 60% of the time. When the teacher began attending to each S if she followed an instruction, the mean percentage of instructions followed increased to 78%. Subsequently, the teacher again employed the base-line procedures and the percentage of instructions followed decreased to 68.7%. When the teacher again provided attention dependent on the S's following the instructions, the percentage of instructions followed increased to 83.7%. Results are consistent with research that has treated instructions as discriminative stimuli. General findings are that consequences of instructed behavior determine the extent to which the instructions are followed. (15 ref.)—*Journal abstract.*

PERSONNEL & INDUSTRIAL PSYCHOLOGY

5118. Fassina, A. & Petit, R. **Les erreurs de lecture en dessin industriel.** [Reading errors in industrial drawing.] *Bulletin Centre d'Etudes et Recherches Psychotechniques*, 1969(Jan), Vol. 18(1), 1-11.—Investigates whether a discrepancy exists between the actual writing of and the interpretation of technical drawings, and whether training in technical drawing is a sufficient prerequisite for the reading and interpretation of such drawings. 14 trade school students were given the task of detecting errors which were implanted into otherwise sound technical drawings. Results demonstrate both false error detections and a lack in perception of gross

errors. A course of study in reading and interpretation of technical drawings is advocated. (English summary) (15 ref.)—*B. A. Stanton.*

5119. **Froehlich, Dean K. The military advisor as defined by counterparts.** *HumRRO Professional Paper*, 1970(Mar), No. 9-70, 6 p.—Defines the characteristics of successful Military Assistance Program advisors as part of a research effort in applying scientific techniques to the selection, training, and management of advisors. Data describing the work of advisors were collected from both advisors and their counterparts. Characteristics and behaviors of the successful advisor as viewed by counterparts are discussed.—*HumRRO.*

5120. **Hill, James W., Bass, Alan R., & Rosen, Hjalmar.** (Western Michigan U.) **The prediction of complex organizational behavior: A comparison of decision theory with more traditional techniques.** *Organizational Behavior & Human Performance*, 1970(Sep), Vol. 5(5), 449-462.—Interviewed 48 electrical appliance repairmen concerning the consequences of bidding or not bidding on the "next highest level job." Ss then evaluated the desirability or undesirability of these consequences on a 7-point scale. Expectations of the probability of occurrence of these consequences were indicated on a scale of likelihood of occurrence. In addition, Ss responded to 2 semantic differential scales and the Need Achievement scale of the EPPS. Results of correlational analyses indicate that the decision theory technique was superior to the semantic differential and Need Achievement scales in predicting bidding behavior. (21 ref.)—*Journal abstract.*

5121. **Morgan, Brian S., Blonsky, Melvin R., & Rosen, Hjalmar.** (Boston Coll.) **Employee attitudes toward a hard-core hiring program.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 473-478.—Assessed attitudes of 214 employees at all organizational levels in a large utility company toward a program involving hiring the hard-core unemployed both before program initiation and after 3 mo. of experience with the program. Ss were administered the Consequences Model Questionnaire. The hypothesized ambivalence of management personnel was verified, as was the differential impact of the program on employees at various levels. In general, the initially positive responses toward the program gave way to a position of balanced neutrality, a state in which assets were counterbalanced by liabilities. Results are interpreted in terms of the impact of the initial position of top management on program operation.—*Journal abstract.*

VOCATIONAL CHOICE & GUIDANCE

5122. **Clemens, Bryan; Linden, James, & Shertzer, Bruce.** (Purdue U., Counseling Div.) **Engineers' interest patterns: Then and now.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 675-685.—Analyzed the SVIB patterns of a 1935 class of engineering students, their 1966 retests, and a 1966 sample from the same university. 2 multiple discriminant function analyses were performed: as 3 criterion groups and as 5 engineering specialty groups. A holdout sample was retained for cross-validation. The 1966 sample differed from the 1935 in scientific and management interests; the 1935 sample shifted its interests toward technical management. In cross-validation 80% of the protocols were correctly classified. The between specialty

discriminant function, however, yielded little useful results. (24 ref.)—*N. M. Chansky.*

5123. **Elton, Charles F. & Rose, Harriett A.** (U. Kentucky, Counseling & Testing Center) **Male occupational constancy and change: Its prediction according to Holland's theory.** *Journal of Counseling Psychology*, 1970(Nov), Vol. 17(5, Pt. 2), 19 p.—Investigated the relation of personality, as measured by the Omnibus Personality Inventory, and ability, as measured by the American College Test, to vocational choice, classified into the Holland system. Ss were 530 graduating males whose occupational patterns of change or stability were predicted by their scores as freshmen. Construct validity was provided for Holland's theory in some instances; in other cases, questions were raised. Data suggest that personality patterns of occupational groups are more a function of those who enter and persist in the group than of those who transfer into it. (24 ref.)—*Journal abstract.*

SELECTION & PLACEMENT

5124. **Asher, James J.** (San Jose State Coll.) **How the applicant's appearance affects the reliability and validity of the interview.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 687-695.—Rated TV tapes of interviews with 20 students enrolled in a statistics course by groups of Ss enrolled in an experimental psychology course. 1 group viewed the tape and rated it question by question (Q); 1 group viewed the tape and gave an overall rating (O); 1 group heard the tape and rated each question; and 1 group heard the tape and gave an overall rating. The Q format produced higher reliability coefficients than did the O. Viewing did not affect reliability but it did influence validity. Higher correlations with final exams and teacher paired-comparison ratings were obtained under the viewing condition.—*N. M. Chansky.*

5125. **Richardson, J. F.** (Psychological Research Unit, Albert Park Barracks, Melbourne, Australia) **Test R03(M): A second report.** *Australian Military Forces Research Report*, 1969, No. 4-69, 7 p.—Describes final procedures in the construction of a new recruit battery screening test, R03(M), equivalent to the current R03(X). It is concluded that R03(M) may be considered an equivalent form of the R03(X), and that its future operational use depends only upon the establishment of more fully representative norms.—*Journal abstract.*

5126. **Travaglio, Ray F.** (Pan American Petroleum Corp., Houston, Tex.) **Response differences among employment applicants.** *Personnel Journal*, 1970(Jul), Vol. 49(7), 593-597.—Analyzes the "responses of 464 applicants, of which 91 were hired . . . to perform a group of relatively homogeneous low level, routine, clerical jobs. Unfortunately, small numbers permit only a classification across race, not sex. However, 90% of the applicants are female." Results, based on an experimental employment test and a self-concept questionnaire across contemporary control variables showed that significant correlations do exist between test scores, questionnaire items indicating self-concepts, and interviewer ratings. Also, higher scoring applicants and higher self-concept are likely to receive higher interviewer ratings.—*P. L. Crawford.*

5127. **Van Damme, Francis.** (24 Ave. de Mars, Brussels, Belgium) **Résultats d'une utilisation du test P. F. de**

Rosenzweig en sélection d'agents de vente. [Results of using the Rosenzweig P. F. test in selection of salesmen.] *Revue de Psychologie et des Sciences de l'Education*, 1970, Vol. 5(2), 172-188.—3 theoretical patterns of personality of salesmen were submitted to an experimental control: Rosenzweig's Picture-Frustration Study was used to investigate the salesmen's outstanding characteristics and to compare the results of the test with the assumptions of the 3 theories. Significant differences were obtained between 31 successful sales trainees and 24 refused candidates, both samples coming from the same selection procedure including the Picture-Frustration Study. Salesmen proved to be much more self-controlled against frustration, and rejection, and more interested in surmounting hindrances according to the requirements of the job. (Flemish summary)—*English summary*.

TRAINING

5128. Duker, S. **Teaching listening: Recently developed programs and materials.** *Training & Development Journal*, 1970(May), Vol. 24(5), 11-15.—About 30% of 500 large corporations provided training in listening in 1963. The number of programs available has increased. Several specific programs are described; e.g., various combinations of tapes, texts, and programed instruction. "The materials reviewed in this article have added much to the feasibility of offering a course in listening as part of management and supervisory training...."—C. A. Bennett.

5129. Johnsrud, Myron D. (U. Wisconsin) **An experimental study of three variations of a method for self-determination of performance level.** *Dissertation Abstracts International*, 1970(Jun), Vol. 30(12-A), 5221-5222.

5130. Jones, Mark J. (Job Corps Center, Clearfield, Vt.) **Role playing as an educational and training device in a poverty-oriented multiracial group.** *Group Psychotherapy*, 1969, Vol. 22(3-4), 195-201.—Role-playing was used as a technique to prepare underprivileged youths for jobs as social service agents. Focus was on the growth and development of the individual. It had advantages both for instruction and for teaching personal and social awareness.—A. Krichev.

5131. Lau, Alan W., Lacey, Lynn, & Abrahams, Norman M. **A non-cognitive test battery as a predictor of Class "A" school performance.** *USN Personnel & Training Research Laboratory Technical Bulletin*, 1970(Mar), No. STB 70-5, 13 p.—As part of a program of evaluating noncognitive tests for use in predicting performance in a group of representative Class "A" schools, the Hand Skills Test (HST), Navy Activities Preference Blank (NAPB), and Navy Adjective List (NAL) were analyzed for their ability to augment the validity of Basic Test Battery (BTB) scores in predicting school performance. The noncognitive tests were administered to 1593 incoming students at 7 Class "A" schools varying widely in curriculum and to 389 students in the Submarine School. Scores were combined with BTB subtests to determine if noncognitive test scores supplemented BTB measures in multiple-regression equations. Analysis of the data indicates that neither the NAPB, NAL, nor the HST contributed significantly toward the prediction of school achievement beyond that currently attainable with the BTB.—*Journal abstract*.

5132. Newman, Lawrence E. & Steinberg, J. Leonard. (U. California, Medical School, Los Angeles) **Consultation with police on human relations training.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1421-1429.—Investigated the Los Angeles Police Academy's human relation training program which has been operational since 1965 (after the Watts' disorders). The program is discussed with relation to the various methods of presenting the material to the police trainees and cadets. The areas covered in the program include: (a) understanding and relating to ethnic minority communities—especially the Mexican-American and Negro communities; (b) handling service calls, i.e., psychiatric emergencies, family disputes, and youth contacts; (c) understanding and dealing with personal stress associated with the daily demands of police work; and (d) the meaning of police professionalism. By presenting the material in small discussion groups led by police officers, the program was able to communicate the far-reaching problems confronting police officers in their nonpunitive relations with the citizens of metropolitan Los Angeles. A brief mention of other similar programs in cities throughout the United States is also given.—P. R. Shibleski.

5133. Reinstein, Michael. (Ft. Benning, Mental Health Service, Ga.) **Group therapy for basic trainees: A means of coping with adjustment problems.** *Military Medicine*, 1970(Sep), Vol. 135(9), 760-764.—Group therapy was used as a method for encouraging self-expression, especially of hostile feelings, in men who were having difficulties in a recruit training situation. This program resulted in a reduction of the AWOL rate by $\frac{1}{2}$, the recycle rate by $\frac{1}{3}$, and the psychiatric discharge rate by $\frac{1}{2}$.—G. A. Clum.

5134. Taylor, John E. **Factors related to individual training.** *HumRRO Professional Paper*, 1970(Apr), No. 11-70, 5 p.—Presents findings of ongoing research on the design of strategies for conducting individual training. Studies conducted in laboratory and operational training settings assess the impact of individual difference, task, and training method variables on the design of training strategies. Findings bear directly on the army's requirements for designing efficient instruction for a training population that now includes large numbers of trainees in all mental categories of the Armed Forces Qualification Test.—*HumRRO*.

5135. Weingarten, Kenneth, et al. **Functional context training in an operational system.** *HumRRO Professional Paper*, 1970(Mar), No. 8-70, 9 p.—Describes a work plan for the development of a complete training model suitable for multiaptitude training populations and stressing individualized, self-paced learning in an operational functional context. Progress through the curriculum is determined by proficiency in task performance. The training model generates novel management problems and provides techniques for their solution.—*HumRRO*.

5136. Jones, Richard R. & Burns, W. J. (Oregon Research Inst., Eugene) **Volunteer satisfaction with in-country training for the Peace Corps.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 533-537.—Studied 248 Peace Corps volunteers' satisfaction with training in 8 Indian projects classified according to training time spent in-country—heavy-, light-, and no in-country training (ICT). 7 satisfaction scores derived from a training evaluation questionnaire were treated as dependent variables in a nested analysis of variance

design. Results indicate greater satisfaction with 3 training components for volunteers with heavy-, or light-vs. no ICT. Volunteer satisfaction was significantly higher for light than heavy ICT. Significant variations in mean satisfaction were obtained among different projects, within ICT groups. The efficacy of incountry vs. United States training programs and the desirability of evaluating projects using outcome measures other than volunteer satisfaction are discussed.—*Journal abstract.*

TASK & WORK ANALYSIS

5137. ———. **HumRRO studies in continuous operations.** *HumRRO Professional Paper*, 1970(Mar), No. 7-70, 11 p.—Conducted a laboratory and a field study to obtain data on performance decrements on tank crew tasks during 48 hr. of continuous combat operations, and to examine the degree of decrement in terms of its effect on tactical efficiency. Ss were 142 tank crewmen and 30 tank crews, respectively. Results illustrate the need for increased efficiency in obtaining human factors information, demanded by the increasing complexity of military tactics and equipment.—*HumRRO.*

5138. Brown, Frank L. & Jacobs, T. O. **Developing the critical combat performance required of the infantry rifle platoon leader.** *HumRRO Technical Report*, 1970(Apr), No. 70-5, 89 p.—Describes methods employed in work unit LEAD to identify and record the critical combat performances, knowledge, and skills required of the infantry rifle platoon leader. From over 200 small-unit combat actions ranging from World War II to Vietnam, some 6000 performances, knowledge, and skills were extracted, categorized into major subject areas, and recorded in 41 research by-products. The methodology developed by this research may be applicable to the identification of combat requirements of other military command or staff functions. Detailed descriptions of small-unit combat actions, recorded by unit historians, will provide useful sources of data for other similar research.—*HumRRO.*

5139. Bruyns, R. A. (Sector Arbeidszaken, Hoofdbureau der Nederlandse Staatsmijnen, Hague) **Werk en werkmotivatie in een geautomatiseerde industriële organisatie.** [Work and work motivation in an automated industrial organization.] *Mens en Onder-neming*, 1970(May), Vol. 24(3), 164-175.—Discusses the changes in the industrial system as a result of the continued and enlarged emphasis on automation. Projected changes in industry incorporate the shift in the task of the worker from an operator of a machine to an observer of the machine operation. The operator should also be able to diagnose the malfunction of the machine as well as to suggest improvements. Consequently the education of the operator will be upgraded. Automation will affect the organizational pattern from a line-and-staff to a functional organization with an altered pattern of the functions of administrative and supervisory personnel. The shifting in the preparation of the blue-collar workers will be in the direction of more technical training and for the white-collar workers from administrative training to technical training. Maslow's pattern of motivational categories is used to illustrate that the motivation of the personnel will shift from the goals of reducing physical needs and acquiring security to that of autonomy and self-realization. (16 ref.)—*A. J. Ter Keurst.*

5140. Burger, William J., Knowles, William B., & Wulfeck, Joseph W. (Dunlap & Assoc., Santa Monica, Calif.) **Validity of expert judgments of performance time.** *Human Factors*, 1970(Oct), Vol. 12(5), 503-510.—Describes an apparatus and method for validating estimates of performance time and reliability against empirical measures of human performance time and reliability. Measures of performance time were obtained on 5 tasks and were correlated with estimates of performance times obtained from 8 judges in a previous study. Median observed and estimated performance times were highly correlated ($r = .98$, $p < .01$). Estimates of maximum performance time corresponded to the 95th-100th percentiles of the observed distribution of performance time, but estimates of minimum performance time were high and scattered over the lower percentiles. The significant validity coefficient suggests the feasibility of using estimates of performance time in system-analytic models when empirical data are lacking and are too expensive to obtain.—*Journal abstract.*

5141. Greening, Charles P. & Wyman, Melvin J. (North American Rockwell, Autonetics Div., Anaheim, Calif.) **Experimental evaluation of a visual detection model.** *Human Factors*, 1970(Oct), Vol. 12(5), 435-445.—Performed a fixed-base simulation experiment to gather visual air-to-ground target recognition performance data for comparison with predictions from the autonetics detection model. Color motion picture imagery obtained during a low-altitude flight simulated the O's forward view. O performance was measured in terms of probability and range of correct target recognition. The autonetics detection model incorporates parameters related to the target, the environment, and O. In generating theoretical predictions from the model, values of all parameters were specified independently of the data obtained. No curve fitting techniques were used to improve the fit between the empirical and theoretical curves. Results indicate a close relationship between the obtained performance data and the model predictions. A product-moment correlation of +.53, significant at the .001 level, was obtained between the empirical and theoretical 50% recognition ranges.—*Journal abstract.*

5142. Schori, Thomas R. (U. South Dakota) **Tracking performance as a function of precision of electrocutaneous feedback information.** *Human Factors*, 1970(Oct), Vol. 12(5), 447-452.—Determined which of 3 degrees of preciseness of electrocutaneous feedback information results in the most accurate tracking performance for each of 2 levels of task difficulty. Contrary to expectations, the most precise (continuous) error information did not result in the best performance. On both levels of task difficulty, the best performance resulted when error information of an intermediate precision was used.—*Journal abstract.*

PERFORMANCE & JOB SATISFACTION

5143. Girona, Ricardo. (U. Florida) **The semantic differential as a tool in predicting the potential effectiveness of student nurses.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 220.

5144. Goodman, Paul S., Rose, Jerry H., & Furcon, John E. (U. Chicago, Graduate School of Business) **Comparison of motivational antecedents of the work performance of scientists and engineers.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 491-495. 66

scientists and engineers served as Ss. The 4 models assessed were direction of motivational orientation, source of motivational stimulation, job dedication, and an expectancy model. Work performance was measured by both self-reports and actual output of papers, patents, and books; and by self-reports of unpublished technical reports and formal talks. Results generally indicate that the expectancy model is a better predictor of work performance than the other 3 models.—*Journal abstract.*

5145. Lawler, Edward E. (Yale U.) **Job attitudes and employee motivation: Theory, research, and practice.** *Personnel Psychology*, 1970(Sum), Vol. 23(2), 223-237.—Research on job attitudes and motivation has shown that the relation between satisfaction and performance is a complex one. Satisfaction is an indicator of an employee's motivation to come to work but influences job performance very indirectly. Performance can under certain conditions directly influence satisfaction: Models for extrinsic motivation and for intrinsic motivation based on the interaction of expectancy, instrumentality, and importance attitudes are described. Implications for practice are presented. (30 ref.)—A. S. Thompson.

5146. Locke, Edwin A. (U. Maryland) **Job satisfaction and job performance: A theoretical analysis.** *Organizational Behavior & Human Performance*, 1970(Sep), Vol. 5(5), 484-500.—Argues that job satisfaction and dissatisfaction are outcomes of action. The effect of performance on satisfaction is viewed as a function of the degree to which performance leads to the attainment of the individual's important job values. Emotions, i.e., satisfaction and dissatisfaction, are important incentives to action in that they entail action tendencies (i.e., approach and avoidance). Emotions, however, are not seen as determining action. It is argued that performance is the direct result of the individual's specific work goals and these goals are determined by the individual's values, knowledge, and beliefs in the context of the situation as he understands it. (41 ref.)—*Journal abstract.*

5147. McGraw, James P. (U. Kansas) **A comparison of MMPI scores and other variables with subsequent ratings of Nazarene ministers by their district superintendents.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 157.

5148. Mobley, William H. & Locke, Edwin A. (U. Maryland) **The relationship of value importance to satisfaction.** *Organizational Behavior & Human Performance*, 1970(Sep), Vol. 5(5), 463-483.—Explored the relationship between the importance of a job aspect (value) to an individual and his degree of satisfaction and dissatisfaction with that aspect in an experiment with 381 undergraduates in 5 studies. 4 of these studies tested the hypotheses that value attainment and value frustration would produce more satisfaction and dissatisfaction, respectively, when the value was more important than when it was less important. The 5th study tested the hypothesis that the overall variability in satisfaction with a job aspect would be proportional to the importance of that aspect. The hypotheses were supported. It is suggested that the results provide a plausible explanation for the seemingly inconsistent results of previous studies in this area.—*Journal abstract.*

5149. Plag, John A., Goffman, Jerry M., & Phelan, James D. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **The adaptation of naval enlistees scoring in mental group IV on the Armed Forces Qualification Test.** *USN Medical Neuropsychi-*

atric Research Unit Report, 1967(Sep), No. 68-23, 11 p.—Evaluated differences in the adaptations of average and mentally marginal sailors during 4 yr. of military service. Ss with Armed Forces Qualification Test (AFQT) scores of 50 are significantly superior to Category IV enlistees on military performance measures in which cognitive abilities play an essential role. While mental group IV Ss have appreciably lower rates of overall naval effectiveness, they do not differ significantly from average enlistees with respect to disciplinary and illness rates. 4 preenlistment characteristics were found to be valid for predicting 4-yr naval effectiveness among Category IV personnel. These 4 variables were yr. of schooling completed, number of school expulsions, AFQT score, and number of arrests. An actuarial table, showing the probability of naval effectiveness as a function of different combinations of these 4 predictors, was constructed as a guide for the use of recruiting officers in making decisions concerning the enlistment of mentally marginal applicants.—*Journal abstract.*

5150. Rothe, Harold F. (Beloit Corp., Wis.) **Output rates among welders: Productivity and consistency following removal of a financial incentive system.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 549-551.—Analyzed production data for a group of welders for 48 wk. following the removal of a financial incentive system, and an accompanying loss of take-home pay. Productivity dropped immediately and then began to climb. 2 previously stated hypotheses relative to the effectiveness of incentives were examined. 1 hypothesis concerning the ratios of the ranges of intra- vs. interindividual differences was not supported. The 2nd hypothesis concerning the week-to-week consistency of productivity was supported. As productivity increased over a period of time, the consistency of productivity also increased.—*Journal abstract.*

5151. Siegel, Arthur I. & Federman, Philip J. (Applied Psychological Services, Inc., Wayne, Pa.) **Development of performance evaluative measures: Investigation into and application of a Fleet posttraining performance evaluative system.** Wayne, Pa.: Applied Psychological Services, Inc., 1970. 79 p.—Attempted the development and demonstration for providing feedback on the technical proficiency of Navy electronic maintenance personnel. The method relied largely on a personnel reliability index. The personnel reliability index is based on the compounding of probability of successful performance values for 8 factorially derived electronic job dimensions. Statistically significant differences were evidenced among the derived indices for the Naval ratings and job factors involved. A 2nd instrument was used, based on a Guttman scaled checklist. It yielded an absolute measure of performance.—P. Federman.

5152. Smith, Patricia C., Kendall, Lorne M., & Hulin, Charles L. (Bowling Green State U.) **The measurement of satisfaction in work and retirement: A strategy for the study of attitudes.** Chicago, Ill.: Rand McNally, 1969. xiii, 186 p.

5153. van Beijnum, H. J., van Gils, M. R., & Verhagen, E. J. (U. Rotterdam, Netherlands) **Taakontwerp en organisatie: Verslag van een veldexperiment.** [Task design and organization: A report of a field experiment.] *Mens en Onderneming*, 1970(May), Vol. 24(3), 149-163.—Hypothesized and confirmed that worker morale and productivity would increase as a result of changes in the work situations that incorporate worker abilities to a

better degree. The situation was in a clearinghouse where the task was operating computers. The task was routinized and required a minimum of training. Few interpersonal exchanges occurred among the workers. The business was not concerned about employee satisfaction. There were 59 experimental Ss and 40 controls, all female. Beginning in May 1965, variation in tasks was permitted for experimental Ss in keeping with their abilities. Controls had been significantly superior in productivity during the 16 mo. preceding the start of the experiment. After the change in the experimental Ss' work patterns, productivity was almost equal to the controls. Also, worker satisfaction was significantly higher (.01 level) for experimental Ss than for controls after the change. (18 ref.)—A. J. Ter Keurst.

MANAGEMENT & ORGANIZATION

5154. Drabek, Thomas E. & Haas, J. Eugene. (U. Denver) **Laboratory simulation of organizational stress.** *American Sociological Review*, 1969(Apr), Vol. 34(2), 223-238.—Investigated organizational stress, possibly precipitated by natural disaster through realistic simulation. 3 teams of police communication room personnel participated in each of the 3 simulations with normal system demands. The teams then confronted system stress through a simulated disaster. Changes in team performance patterns under stress appeared related to strains existent in the system prior to stress and to incompatibilities between system structure and emergent system demands. Among the most important changes in group structure which increased system capacity was the gradual emergence of a display mechanism whereby intrateam activity became more shared. (37 ref.)—*Journal abstract*.

5155. Ivancevich, John M., Donnelly, James H., & Lyon, Herbert L. (U. Kentucky) **A study of the impact of management by objectives on perceived need satisfaction.** *Personnel Psychology*, 1970(Sum), Vol. 23(2), 139-151.—A before and after study of the need satisfactions of employees in 2 organizations revealed that the manner in which management by objectives was implemented and the frequency of feedback consultations affected need satisfaction. (16 ref.)—A. S. Thompson.

5156. Roberts, Karlene H. (U. California, Berkeley) **On looking at an elephant: An evaluation of cross-cultural research related to organizations.** *Psychological Bulletin*, 1970(Nov), Vol. 74(5), 327-350.—Categorizes the literature into 26 substantive areas and further classifies it on the bases of whether entries offer micro- or macro-data, and the vantage point from which research questions are asked. Thus, findings concerned with the characteristics of individuals in organizations, organizational subunits, organizational totalities, and organizational interactions are considered. The available work is considered in terms of 3 questions: (a) from this research, do we know anything new; (b) are investigations guided by theoretical principles that suggest relevant questions; and (c) are the methodological approaches useful? The problem of defining culture is discussed, and some of the variables that should be looked at in future work are suggested. A few substantive and methodological approaches that might be helpful are mentioned. (4 p. ref.)—*Journal abstract*.

5157. Sloan, Stanley. (U. Wisconsin) **Management development in hospitals: A case study.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 431.

5158. Thomson, Harvey A. (McGill U., Graduate School of Business, Montreal, Quebec, Canada) **Comparison of predictor and criterion judgments of managerial performance using the multitrait-multimethod approach.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 496-502.—Used the multitrait-multimethod matrix technique to examine the predictive validity of ratings of management potential derived from an industrial assessment center program. Ss were 71 professional, technical, and lower level managerial personnel. Psychologists' and managers' ratings on 13 assessment dimensions were correlated with supervisors' ratings of current job performance on the same dimensions. Ratings obtained of on-the-job performance were lower in quality than the predictor ratings. The median reliability of the criterion ratings was .52 compared to median reliabilities of .85 and .89 for the psychologists' and managers' ratings, respectively. Supervisors failed to differentiate the various dimensions. Results are compared with findings of other studies that used this technique to determine the sources of unreliability in the criterion.—*Journal abstract*.

SPECIAL ENVIRONMENTS

5159. Kondror, I. S. **Ocherki po fiziologii i gijene cheloveka na krainem severe.** [Essays on the physiology and hygiene of man in the far north.] Moscow, USSR: Meditsina, 1968.—This book deals with the problems of acclimatization of man, in which social factors are considered along with the "climatogeographical," since the interrelationship of man's organism with his environment is viewed as a "complex social-biological problem." The social setting for the interplay of physiological factors is considered to be of importance. Data are presented on the "psychophysiological status" of members of polar expeditions, staying for long stretches of time in a small group.—I. D. London.

5160. Ono, Hiroshi; O'Reilly, Joseph P., & Herman, Louis M. (York U., Downsview, Toronto, Ontario, Canada) **Underwater distance distortion within the manual work space.** *Human Factors*, 1970(Oct), Vol. 12(5), 473-480.—Measured apparent distance of a target within arm's length above and under water. 8 experienced and 8 novice divers wearing facemasks indicated apparent distances by reaching responses. The viewing conditions were (a) target and S in air environment, (b) target in water but S in air, and (c) target and S under water. Apparent distances were smaller in Conditions b and c than in a. This difference is attributed to the dissimilar convergence and accommodation requirements in the various conditions. There was little difference between the experienced and novice Ss. (15 ref.)—*Journal abstract*.

5161. Russotti, Joseph S. & Duffy, Joseph R. **An evaluation of three methods for unscrambling helium speech produced at depths of 800 and 1000 feet.** *U.S. Naval Submarine Medical Center Report*, 1969(Oct), No. 602, 5 p.—Evaluated 3 systems for unscrambling helium speech produced at simulated depths of 800 and 1000 ft. Recordings of the Modified Rhyme test read by an experienced male diver in a pressurized helium atmosphere were processed through 3 commercial frequency-shifting devices. The intelligibility of words passed through these systems was compared to scores obtained when the same helium recording was

presented directly without alteration and when presented at $\frac{1}{2}$ playback speed to groups of listeners. A within-Ss' design was employed with suitable counterbalancing so that no word was heard twice by the same listener. $\frac{1}{2}$ speed playback (58.5% intelligibility) was significantly superior to all other conditions. The Kay Electric Company Varivox (43.2% intelligibility) was significantly inferior to the other 2 commercial systems. The Industrial Electronics Corp. and the Gotham Audio Corp. units were equal in performance (50.7% and 51.0% intelligibility, respectively) and superior in intelligibility to unaltered helium speech (45.7%). Methods for adapting these units for improved operation at greater depths are suggested.—*Journal abstract.*

5162. Smith, Paul F. **Underwater hearing in man: I. Sensitivity.** *U.S. Naval Submarine Medical Center Report*, 1969(Feb), No. 569, 23 p.—Reviews all available research on the underwater hearing sensitivity of man. New data on the underwater hearing of divers with known air conduction and bone conduction levels were presented. It is concluded that: (a) man suffers a loss of sound pressure sensitivity upon immersion, (b) underwater hearing sensitivity is frequency dependent with peak sensitivity being about 61–64 db. above .0002 dynes/sq. cm. at 1 kHz., (c) air conduction auditory deficiencies are not reflected in underwater hearing levels unless the air conduction deficiencies are accompanied by bone conduction deficiencies, and (d) wet suit diving hoods reduce underwater sensitivity to sound by 25–35 db. at frequencies of 1 kHz. and higher. (29 ref.)—*Journal abstract.*

5163. Cahoon, Richard L. (U.S. Army Research Inst. of Environmental Medicine, Natick, Mass.) **Vigilance performance under hypoxia.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 479–483.—Tested vigilance performance by 20 young male military Ss on a 2-hr brightness discrimination task under 4 levels of hypoxia: 21% oxygen (sea level), 12.8% oxygen (13,000 ft.), 11.8% oxygen (15,000 ft.), and 10.9% oxygen (17,000 ft.). Results indicate a significant decrement in signal detection as a function of severity of hypoxia and task duration. Analyses of d' and β show a significant decrease in detectability of the signal as a function of hypoxia, but no change in caution of decision making. Individual variation in performance was related to field dependence as measured by the Embedded Figure Test (EFT). EFT score correlated negatively with false detection rate, and positively with RT and d' , indicating a negative relationship between field dependence and vigilance performance.—*Journal abstract.*

ADVERTISING & CONSUMER PSYCHOLOGY

5164. Nylen, David W. (U. Florida) **An analysis of product-fact versus psychosocial appeals in advertising: An application of the theory and methods of the behavioral sciences to a business problem.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-A), 47.

ENGINEERING PSYCHOLOGY

5165. ———. **Milestones: A directory of human engineering laboratories publications, 1953–1969.** Aberdeen Proving Ground, Md.: U.S. Army Human Engineering Laboratories, 1970. iii, 118 p.

5166. Barnes, John A. **Tactical Utility Helicopter**

Information transfer study. *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Mar), No. 7-70, 96 p.—Enumerated the task requirements of the Tactical Utility Helicopter Mission and presented the instrumentation that experienced pilots feel is necessary to perform these tasks. Film of eye movement was taken for 2 Ss while they were flying missions that incorporated these tasks. The film and the Ss' replies provided the information transfer requirements for the Tactical Utility Helicopter flight instrumentation.—*Journal abstract.*

5167. Cohen, Edwin & Follert, Richard L. (Singer Co., Link Div., Binghamton, N.Y.) **Accuracy of interpolation between scale graduations.** *Human Factors*, 1970(Oct), Vol. 12(5), 481–483.—Examines the accuracy with which engineering personnel can interpolate the position of a pointer or index between 2 scale graduations. Each of 20 Ss estimated the position of a mark on each of 99 5-in linear, ungraduated scales. Estimates were given in units over the range 0–100 units. The median error was only 1.5% of the distance between the 2 marked graduations. Accuracy was greatest at the ends and middle of the scale. Data indicate that interpolation of fifths and even tenths will provide accuracy satisfactory for most situations.—*Journal abstract.*

5168. Holding, D. H. (Ed.) (U. Louisville) **Experimental psychology in industry: Selected readings.** Baltimore, Md.: Penguin Books, 1969. 445 p. \$2.95(paper).—Contains a collection of papers by various authors on man-machine interactions, covering a broad range of human performance topics including human engineering, noise abatement, and quality control.

5169. Simpson, Duncan W. **Advanced training systems.** *Flight Safety*, 1968(Dec), Vol. 2(2), 30–31.—Established "the basic engineering guidelines for the design of an advanced training system," including record/playback, performance comparison, and adaptive training. The development of the performance comparison is covered in detail.—*G. Steele.*

Displays & Controls

5170. Dill, Amanda B. & Gould, John D. (IBM T. J. Watson Research Center, Yorktown Heights, N.Y.) **Flickerless regeneration rates for CRT displays as a function of scan order and phosphor persistence.** *Human Factors*, 1970(Oct), Vol. 12(5), 465–471.—Used 21 different scan orders and 2 phosphors (P-12 and P-38) in a computer-automated experiment. Results show that flickerless regeneration rates depended principally upon phosphor persistence; scan order had only a minor influence. The main effect of random and pseudorandom scanning was to reduce the disturbing effects of display flicker when it did occur, rather than to reduce significantly the regeneration rate at which flicker did not occur. (16 ref.)—*Journal abstract.*

5171. Hirsch, Richard S. (International Business Machines Corp., Research Lab., San Jose, Calif.) **Effects of standard versus alphabetical keyboard formats on typing performance.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 484–490.—Compared the typing performance of nontypists on 2 typewriter keyboards, 1 with a standard key arrangement and the other with keys rearranged in alphabetical sequence. Analysis included results for 40 Ss whose scores in a pretest were lower than 2 strokes/sec. Ss were divided into 2 groups. Following pretests on both standard and alphabetical

keyboards, each group practiced on 1 type of keyboard only. At regular intervals, Ss took 10-min tests on the assigned machines; and at the end of the practice, all Ss were tested again on both machines. Results indicate that untrained typists can enter correct data faster on a standard typewriter keyboard than on the sequential alphabetical keyboard.—*Journal abstract.*

DRIVING & SAFETY

5172. Bose, S., Roy, K. P., & Das Gupta, S. C. (Group of Hosp., Calcutta, India) **An attitude study of multi-accident omnibus drivers.** *Indian Journal of Applied Psychology*, 1969, Vol. 6(1), 3-12.—A study of 100 drivers on a 10-item 5-point attitude inventory on job satisfaction, social satisfaction, fellow relations, life Gestalt, and optimism showed that drivers with an antiattitude had more accidents. Cluster analysis revealed the presence of a single operational factor of the antiattitude contributing to more accidents. The degree of the antiattitude was positively related to the number of accidents.—*U. Parcek.*

port (SST). *FAA Office of Aviation Medicine Report*, 1970(May), No. 70-9, 23 p.—Reviews data on visual perception and target detection in establishing a basis for the need to equip the SST with anticollision lights.—*W. E. Collins.*

5174. McBain, William N. (San Jose State Coll.) **Arousal, monotony, and accidents in line driving.** *Journal of Applied Psychology*, 1970(Dec), Vol. 54(6), 509-519.—Lack of alertness in monotonous work situations may result from lowered arousal induced by restricted and repetitive stimulation. Line driving is held to be monotonous in this sense, hence laboratory evaluation of a driver's resistance to monotony should predict his accident record. A highly repetitive, 42-min paced task was performed under controlled conditions by 20 line drivers. Self-reports on monotony susceptibility, intelligence test scores, and peer ratings were obtained. Supervisory ratings, traffic convictions, and objective driving measures were criteria in addition to accident records. Accidents of 1 type were predicted by task errors ($r = .63$; $p < .01$). Other relations in the correlation matrix are discussed, and a tentative hypothesis advanced concerning the relations among arousal, accidents, and driver behavior.—*Journal abstract.*

Brief Subject Index

This index supplements the classification of abstracts given in the Table of Contents, and is designed to lead the reader to subjects that are more specific than the general categories of the classification. When many abstract numbers are listed under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

4571, 4574, 4575, 4926

Alcohol/Drinking of (SEE Alcohol)

Alcoholism
4327, 4441, 4556, 4563, 4564, 4565, 4566,
4567, 4568, 4569, 4570, 4571, 4572, 4573,
4574, 4575, 4619

Alienation (see also Isolation)
4009, 4031, 4038, 4064, 4698, 4978

Allergy (SEE Illness, Psychosomatic Disorder)

Alternation (SEE Learning/Maze, Learning, Rat/Maze Learning in, Laterality)

Altruism (SEE Value & Values, Interpersonal Processes)

Ambiguity (SEE Meaningfulness, Information)

American Psychological Association (SEE Organizations)

Amisriptyline (SEE Antidepressant Drugs)

Amnesia
3511, 3593, 3598, 4742, 4743

Amphetamine
3689, 3703, 3710, 3711, 3714, 3719, 3722,
3723, 3727, 3742, 3760, 3766, 4207, 4371,
4439

Anagram (SEE Problem Solving)

Anal & Anal (SEE Psychoanalytic Theory)

Analysis (see also Statistics)
3226, 3228, 3235, 3252, 3255, 3256, 3257,

BRIEF SUBJECT INDEX

3264, 4050, 4081, 4258, 4537, 4544, 4912, 4920, 4927

Anchor Effect & Anchoring (SEE Perception, Localization, the various senses)

Anger (SEE Aggression, Hostility, Emotion, Affect)

Animal Psychology (see also Sexual Behavior-Animal, Social Behavior/Animal, Comparative Psychology)

Animals (see also Bird, Cat, Chicken, Dog, Fish, Frog, Insect, Monkey, Mouse, Pigeon, Rabbit, Rat)

3268, 3536, 3542, 3577, 3595, 3597, 3627, 3645, 3663, 3669, 3680, 3749, 3762, 3763, 3764, 3783, 3805, 3807, 3808, 3809, 3812, 3817, 3828, 3829, 3843, 3847, 3866, 3874, 3875, 3876, 3888, 3890

Anomie (SEE Alienation)

Anorexia (SEE Emotional Disturbance, Food Intake)

Anoxia (SEE Respiration)

Anthropology (SEE Culture)

Antidepressant Drugs (see also Drug Therapy)

3688, 3712, 3745, 3747, 4361, 4439, 4447, 4458, 4460

Anti-Semitism (SEE Prejudice, Religion)

Antisocial Behavior (see also Aggression, Behavior Disorder, Crime & Criminals, Delinquency/Juvenile)

4387, 4514, 4558, 4560, 4590, 4597, 4858

Anxiety (see also Fear, Phobia, Test Anxiety)

3286, 3372, 3422, 3428, 3683, 3780, 3988, 4006, 4087, 4106, 4107, 4115, 4120, 4127, 4130, 4235, 4242, 4246, 4286, 4288, 4401, 4418, 4419, 4444, 4450, 4460, 4485, 4493, 4508, 4552, 4604, 4654, 4692, 4824, 4826, 4831, 4877, 4880, 4884, 4886, 4889, 4895, 4903, 4930, 4966, 5030, 5034, 5046, 5095

Anxiety/School (SEE Anxiety, School Adjustment, Test Anxiety)

Apathy (SEE Attitude, Emotion)

Aphasia (SEE Speech/Defective, Reading Deficiency)

Apparatus

3266, 3267, 3269, 3270, 3271, 3272, 3273, 3301, 3410, 3411, 3516, 3520, 3541, 3543, 3609, 3610, 3617, 3624, 3626, 3633, 3634, 3779, 3800, 3801, 4708

Apparatus-Animal

3264, 3265, 3268, 3271, 3274, 3543, 3587, 3590, 3610, 3624, 3629, 3776, 3801

Apparent Distance (SEE Perception/Depth)

Apparent Movement (SEE Gestalt Psychology, Visual Perception)

Appetite (SEE Food Intake)

Approach-Avoidance (SEE Conflict, Avoidance Behavior)

Approval (SEE Acceptance, Social Approval)

Aptitude (SEE Ability, Test/Aptitude)

Archimedes Spiral (SEE Illusion)

Arctic (SEE Environment)

Arithmetic (SEE Curriculum, Mathematics)

Arms Control (SEE International Relations, Law)

Army (SEE Military, Personnel/Military)

Arousal (see also Attention, Electroencephalography)

3398, 3402, 3403, 3422, 3474, 3646, 3683, 3977, 4087, 4091, 4230, 4265, 4616, 4640, 4692, 5174

Art (SEE Aesthetics, Creativity, Drawing, Literature, Music)

Arteriosclerosis (SEE Cardiovascular Disorders)

Articulation (SEE Speech, Verbal Behavior)

Ascendancy-Submission (SEE Dominance)

Aspiration & Aspiration Level (see also Expectation, Achievement Motivation)

4320, 4915, 4966, 5014, 5050

Assimilation (SEE Adjustment/Personal & Social, Culture)

Association

3345, 3395, 3429, 3445, 3447, 3451, 3453, 3478, 4001, 4083, 4783

Association/Word

3473, 3487, 3954, 4188, 4723, 4807

Associations (SEE Organizations)

Asthma (SEE Illness, Psychosomatic Disorder)

Ataxia (SEE Nervous System/Disorder of, Schizophrenia/Symptomatology of)

Athletics (SEE Education/Physical, Recreation)

Attention (see also Arousal)

3323, 3350, 3383, 3392, 3398, 3401, 3402, 3403, 3404, 3489, 3513, 3576, 3619, 3647, 3700, 3852, 3897, 3906, 3912, 4001, 4045, 4097, 4161, 4224, 4490, 4783, 4788, 4805, 4806, 4811, 4863, 4943, 4994, 5014, 5049, 5113, 5128, 5174

Attitude (see also next headings, Opinion, Prejudice, Social Perception, Stereotype, Teacher Attitudes & Personality)

3963, 3987, 3998, 3999, 4011, 4031, 4049, 4061, 4066, 4070, 4071, 4072, 4073, 4074, 4075, 4078, 4079, 4081, 4084, 4086, 4090, 4092, 4099, 4100, 4102, 4140, 4149, 4169, 4170, 4174, 4240, 4329, 4415, 4563, 4571, 4585, 4621, 4687, 4699, 4721, 4869, 4877, 4909, 5079, 5121, 5145

Attitude Change

4087, 4088, 4089, 4091, 4093, 4094, 4095, 4096, 4097, 4223, 4464, 4685, 4906

Attitude Measurement

3998, 4048, 4078, 4080, 4082, 4083, 4087, 4093, 4096, 4098

Attitude Toward Mental Illness & Mental Retardation

4077, 4081, 4101, 4464, 4620

Attitude/Student (see also Student/College-Attitudes)

4080, 4891, 4894, 4897, 4899, 4906, 5022, 5052, 5067, 5090, 5111

Attraction (SEE Interpersonal Attraction)

Audience (SEE Communication)

Audiogenic Seizure (SEE Audition, Nervous System/Disorder of)

Audition (see also next headings, Deafness & Hearing Disorder, Ear, Intersensory Processes, Masking, Speech Perception)

3273, 3281, 3309, 3353, 3354, 3370, 3371, 3374, 3392, 3412, 3421, 3452, 3484, 3534, 3569, 3640, 3647, 3648, 3889, 3926, 3933, 4263, 4648, 4702, 4735, 4768, 4789, 4811, 4913, 4918, 5045, 5104, 5128, 5161

Auditory Cortex & Projection Area (SEE Cerebral Cortex)

Auditory Deficit (SEE Deafness & Hearing Disorder)

Auditory Discrimination (see also Audition)

3358, 3364, 3365, 3367, 3401, 3418, 3463, 3859, 3889, 3962, 4714, 4716, 4717, 4940, 4948, 5087, 5088

Auditory Measurement (see also Deafness & Hearing Disorder)

3267, 3367, 3368, 3369, 3370, 3371, 3372, 3373, 3374, 4709, 4712, 4714, 4720, 5152

Auditory Perception

3275, 3279, 3280, 3282, 3297, 3355, 3356, 3357, 3359, 3360, 3361, 3362, 3415, 3464, 3907, 4327, 4711, 4712, 4805, 5162

Auditory Thresholds (SEE Auditory Perception, Auditory Measurement)

Authoritarianism (see also Conformity)

4042, 4049, 4077, 4089, 4108, 4110, 4111, 4143, 4220, 4240, 4279, 4713, 4887, 4990, 5053

Authority (SEE Dominance, Interpersonal Influence, Law, Management, Social Influence)

Autism (SEE Fantasy, Schizophrenia/Childhood)

Autokinetic Effect (SEE Illusion, Gestalt Psychology, Visual Perception)

Automation & Automata (SEE Computer, Industrial Psychology)

Automobile (SEE Driving)

Autonomic Nervous System (SEE Nervous System/Autonomic)

Autonomy (SEE Dependency)

Aversion & Aversiveness

3391, 3422, 3437, 3589, 3597, 3599, 3862, 4432

Aversion Therapy (SEE Behavior Therapy)

Aviation

3298, 3408, 3786, 5141, 5166, 5169, 5173

Avoidance Behavior (see also Rat/Avoidance & Avoidance Learning in)

3437

Avoidance Learning (SEE Learning/Avoidance)

Awareness (see also Arousal, Attention, Conscious States)

3390, 3393, 3399, 3405, 3438, 3457, 4016, 4119, 4145, 4162, 4233, 4490, 4897

Balance (SEE Somesthesia)

Barbiturate (SEE Drugs)

Basal Metabolic Rate (SEE Metabolism)

Battered Child Syndrome (SEE Child Abuse)

Behavior (see also next headings, Child/Social Behavior in, Social Behavior/Animal, Social Behavior/Human)

3269, 3510, 3790, 3810, 3811, 3921, 3924, 3990, 4102, 4159, 4341, 4481, 4691, 5116

Behavior-Animals

3790, 3805, 3806, 3807, 3808, 3811, 3824, 3836, 3881

Behavior Disorder

4514, 4522

Behavior Problems (see also Childhood/Behavior Problems in)

4081, 4387, 4436, 4674

Behavior Therapy

4204, 4369, 4371, 4380, 4401, 4418, 4419, 4420, 4421, 4422, 4423, 4424, 4425, 4605, 4795, 4817, 4821

Behavioral Science

3527

Behaviorism (SEE Behavior, Psychology/History of)

Belief (SEE Attitude, Value & Values)

Bender Gestalt Test (SEE Test/Intelligence)

Benzedrine (SEE Amphetamine)

Bias (see also Prejudice, Experimentation & Experiments)

3224, 3262, 3284, 3354, 3967, 4037, 4368

Bibliographies

 4524, 4543, 4553, 4572, 4637, 4922

BRIEF SUBJECT INDEX

Classroom (see also Education, School, Teaching) 4862, 4863, 4870, 4910, 4928, 4965, 4968

Cleft Lip & Palate (SEE Speech/Defective)

Clergy (SEE Religion)

Client-Centered Therapy (SEE Psychotherapy/Methods in)

Climate (SEE Environment, Temperature)

Clinic (see also Community Services, Hospital, Treatment/Outpatient) 4334, 4342, 4478, 4564, 4612, 4695, 4847, 4851

Clinical Judgment (see also Psychodiagnosis) 4345, 4355, 4368, 4382, 4518, 4519, 4521, 4530, 4535, 4538, 4544, 4545, 4581

Clinical Psychology 4318, 4338, 4342, 4349, 4989

Cluster Analysis (SEE Factor Analysis, Statistics)

Coalition Formation (SEE Group/Small)

Cochlea (SEE Ear)

Coding (SEE Categorical Behavior, Problem Solving, Display)

Cognition (see also Thinking, Categorical Behavior) 3222, 3325, 3386, 3495, 3844, 3897, 3900, 3935, 3943, 3944, 4037, 4142, 4267, 4290, 4308, 4336, 4773, 4836, 4891, 4893, 4990, 5058, 5071, 5073, 5080, 5096, 5115

Cognitive Dissonance (SEE Attitude Change, Dissonance)

Cognitive Style 3381, 3922, 3937, 3964, 4142, 4169, 4241, 4537, 4701, 4916, 5005, 5039

Colitis (SEE Sexual Behavior, Sexual Behavior-Animal)

Cold (SEE Temperature)

College (see also Education, School, Student/College) 4041, 4867, 4872, 4876, 4881, 4887, 4901, 4904, 4909, 5059

College Counseling (SEE Counseling, Guidance/Educational, Guidance/Vocational)

College Student (SEE Student/College)

College Success (SEE Achievement/Academic-College)

Color (see also Color Vision) 3205, 3283, 3298, 3332, 3336, 3349, 3654, 3719, 3830, 3895, 3927, 3976, 4057, 4702, 4783, 4808

Color Vision 3332, 3333, 3334, 3335, 3336, 3337, 3349, 3858, 4705, 4707

Communication (see also Communication/Nonverbal, Information, Language, Speech, Verbal Behavior) 3215, 3913, 3940, 4000, 4089, 4090, 4094, 4097, 4115, 4141, 4148, 4150, 4170, 4171, 4172, 4374, 4383, 4643, 4721, 4870, 4889, 4972, 5082

Communication/Animal (SEE Communication, Vocalization)

Communication/Mass (see also Television, Advertising) 3216, 4174, 5129

Communication/Nonverbal 3310, 4170, 4173, 4359, 4382, 4388, 4643, 4710

Community (see also Culture, Group) 4010, 4034, 4200, 4329, 4469, 4620, 4685, 4855

Community Services (see also Clinic, Mental Health) 4101, 4347, 4348, 4475, 4478, 4564, 4584, 4683, 4687, 4695, 4841, 4842, 4843, 4844, 4845, 4846, 4847, 4848, 4849, 4850, 4852, 4853, 4854, 4856, 5036

Comparative Psychology (see also Animal Psychology) 3611, 3766, 3810, 3811, 3812, 3813, 3814, 3815, 3816, 3825

Competition (see also Conflict, Cooperation, Motivation) 3270, 3395, 3396, 3791, 4104, 4109, 4131, 4141, 4167, 4230

Complexity (see also Cognitive Style, Stimulus) 3306, 3316, 3361, 3379, 3497, 3906, 4169, 4193, 4265

Comprehension (see also Thinking, Reading) 3366, 3490, 4177, 4913, 4918, 5065, 5074

Compulsion (SEE Obsession-Compulsion)

Computer 3223, 3248, 3249, 3250, 3251, 3252, 3253, 3254, 3255, 3256, 3257, 3267, 3335, 3545, 3616, 4039, 4519, 4544, 4547, 4551, 4775, 4920, 4927, 5135, 5153, 5170

Concentration Camp (SEE Prison, War)

Concept (see also Childhood/Concepts & Problem Solving in, Concept Formation, Thinking) 3459, 3486, 3494, 3495, 3496, 3497, 3499, 3500, 4076, 4086, 4134, 4225, 4272, 4276, 4803, 4869, 5005, 5116

Concept Formation (see also Childhood/Concepts & Problem Solving in) 3223, 3339, 3346, 3421, 3498, 3499, 3974, 5116

Conditioned Emotional Response

Conditioned Galvanic Skin Response (SEE Galvanic Skin Response)

Conditioned Reflex (SEE Conditioned Response, Reflex)

Conditioned Response 3547, 3554, 3573, 3586, 3695, 3868, 3872, 3890, 3936

Conditioning (see also next headings) 3436, 3847, 4162, 4517, 4624

Conditioning/Avoidance (SEE Learning/Avoidance, Rat/Avoidance & Avoidance Learning in)

Conditioning/Classical 3440, 3716

Conditioning/Escape (SEE Escape)

Conditioning/Eyelid 3435, 3716

Conditioning/Interceptive 3441

Conditioning/Operant (see also Rat/Conditioning in) 3438, 3457, 3710, 3720, 3848, 3856, 3866, 3911, 3925, 3936, 4424, 4472, 4681, 4813, 4814, 4822, 4943, 4969, 5107

Conditioning/Verbal (SEE Learning/Verbal)

Conference (SEE Symposium)

Confidence Judgment (SEE Certainty)

Conflict (see also Frustration, Learning/Avoidance, Interpersonal Processes) 3492, 3566, 3708, 4002, 4033, 4040, 4064, 4125, 4138, 4139, 4159, 4240, 4629, 4638, 4680, 4853, 4965

Conformity (see also Authoritarianism, Dominance, Expectation, Interpersonal Influence, Social Influence) 3683, 3994, 4145, 4151, 4152, 4153, 4306, 4964

Congress (SEE Symposium)

Connotation (SEE Meaning, Semantics)

Conscience (SEE Value & Values, Ethics, Motivation)

Conscious States (see also Awareness) 3206, 3382, 3386, 3390, 4019, 4497

Conservation (SEE Childhood/Concepts & Problem Solving in)

Conservatism (SEE Political Behavior, Personality Trait)

Consonance (SEE Dissonance)

Constancy (SEE Gestalt Psychology, Visual Perception, Perception)

Consumer Behavior (see also Advertising)

Contagion (SEE Interpersonal Influence, Social Influence)

Content (SEE Information, Meaning)

Context 3436, 3478, 4149, 4658, 4929, 5135

Contraception (SEE Birth Control)

Contribution & Criticism 3224, 3299, 3311, 3315, 3354, 3391, 3399, 3405, 3434, 3490, 3493, 3503, 3964, 3987, 4074, 4118, 4152, 4165, 4206, 4219, 4226, 4276, 4279, 4289, 4320, 4340, 4363, 4437, 4462, 4474, 4501, 4625, 4729, 4783

Control (see also Display) 3325, 3391, 3417, 3794, 3855, 4144, 4234,

4806, 4810, 5166

Control/Internal-External 3417, 4108, 4154, 4233, 4234, 4243, 4277, 4289, 4366, 4601, 4701, 4935, 4978, 5020, 5031, 5107

Convulsion (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)

Cooperation 3503, 3990, 4121, 4125, 4131, 4138, 4139, 4141, 4167, 4236, 4999

Coordination (SEE Motor Performance)

Coping Behavior (SEE Adjustment/Personal & Social)

Copulatory Behavior (SEE Sexual Behavior-Animal)

Correlation (see also Factor Analysis, Statistics) 3225, 3230, 3238, 3242, 3243, 4532, 4632

Cortex (SEE Cerebral Cortex, Visual Cortex)

Counseling (see also Guidance/Educational, Guidance/Vocational, Interview) 4060, 4062, 4199, 4428, 4475, 4689, 4690, 4691, 4693, 4694, 4698, 4786, 4798, 4863, 4889, 4970, 4971, 4973, 4975, 4979, 4984, 4986, 5060

Counseling/College (SEE Guidance/Educational, Guidance/Vocational)

Counselor 4356, 4786, 4972, 4981, 4983, 4987

Countertransference (SEE Interpersonal Processes, Psychotherapy, Psychoanalysis, Therapeutic Process)

Counting (SEE Mathematics, Number)

Court (SEE Law, Crime & Criminals)

Courtship (SEE Interpersonal Attraction)

Creativity (see also Aesthetics, Gifted, Literature, Music, Thinking) 3959, 3963, 4213, 4251, 4260, 4261, 4262, 4263, 4264, 4265, 4266, 4267, 4268, 4269, 4270, 4271, 4279, 4282, 4306, 4872, 4908, 4984, 4997, 5001, 5015, 5069

Credibility (SEE Experimentation & Experiments, Interpersonal Influence, Social Perception)

Crime & Criminals (see also Delinquency/Juvenile, Law, Prison) 4585, 4586, 4587, 4588, 4590, 4591, 4592, 4593, 4596, 4688, 4858

Crisis & Crisis Intervention (see also Community Services, Emotion) 4338, 4345, 4373, 4436, 4582, 4841, 4902

Critical Flicker Fusion (SEE Vision)

Criticism (SEE Contribution & Criticism)

Cross-Cultural Differences (see also Culture, Cultures & Countries) 3291, 3997, 4032, 4044, 4045, 4046, 4047, 4049, 4050, 4051, 4052, 4053, 4054, 4055, 4056, 4057, 4080, 4121, 4287, 4316, 4580, 4882, 5156

Cue 3308, 3315, 3343, 3351, 3421, 3475, 3476, 3487, 3497, 3657, 3829, 3860, 3927, 3938, 3972, 4094, 4164, 4187

Cultural Anthropology (SEE Culture)

Cultural Disadvantage (SEE Socioeconomic Status, Childhood/Disadvantaged)

Culture (see also Cultures & Countries, Ethnology, Social Influence) 3967, 4019, 4020, 4024, 4027, 4031, 4036, 4062, 4076, 4187, 4198, 4254, 4333, 4484, 4489, 4496, 4496, 4499, 4557, 4571, 4575, 5156

Cultures & Countries (see also Culture, Africa, Canada, France, Germany, Great Britain, India, Israel, Japan, Latin America, United States, USSR) 3291, 3957, 4026, 4044, 4048, 4049, 4051, 4055, 4057, 4079, 4080, 4086, 4216, 4222, 4247, 4283, 4301, 4302, 4456, 4559, 4574, 4613, 4619, 4637, 4688, 4882, 4925, 4937, 4999, 5136

Curiosity (SEE Motivation, Thinking)

Curriculum (see also School Administration, Mathematics, Reading) 3939, 3941, 4917, 4933, 5005, 5014, 5017, 5022, 5027, 5032, 5046, 5065, 5066, 5068, 5069, 5070, 5072, 5074, 5075, 5077, 5078.

BRIEF SUBJECT INDEX

5080, 5081, 5082, 5083, 5086, 5087, 5088, 5090, 5091, 5093, 5094, 5098, 5102, 5103, 5117, 5135

Cutaneous Sense (see also Skin)

3205, 3252, 3282, 3292, 3297, 3378, 3379, 3398, 3550, 3564, 3568, 3651, 3655, 3862, 3933, 3971, 4244, 4359, 4702, 4768, 4784, 4805, 5142

Cybernetics (SEE Communication, Feedback, Computer)

Dark Adaptation (SEE Adaptation/Sensory)

Data Processing (SEE Computer, Statistics)

Day Dreaming (SEE Fantasy)

Deafness & Hearing Disorder

4708, 4709, 4710, 4711, 4712, 4713, 4714, 4715, 4716, 4717, 4718, 4719, 4720, 4936, 4942, 4943

Death (see also Suicide)

3515, 3782, 3785, 3788, 3805, 3875, 3981, 4015, 4328, 4487, 4595

Death Penalty (SEE Law)

Deception

4151, 4153, 4273, 4294, 4298, 4604, 4928

Decision Making (see also Choice Behavior, Game, Learning/Probability)

3244, 3359, 3441, 3504, 3982, 3983, 4147, 4999, 5120

Decoding (SEE Categorical Behavior, Problem Solving, Display)

Defecation (SEE Elimination)

Defense Mechanism (see also Identification, Repression)

3303, 3398, 4106, 4134, 4159, 4165, 4437, 4462, 4485, 4493, 4494, 4508, 4567, 4607, 4680, 4794

Defense/Perceptual (SEE Defense Mechanism)

Defensiveness (SEE Defense Mechanism, Personality Trait)

Deja Vu (SEE Familiarity, Parapsychology)

Delayed Reaction (SEE Response)

Delinquency/Juvenile (see also Antisocial Behavior, Crime & Criminals)

4599, 4600, 4601, 4602, 4603, 4604, 4605, 4628

Delirium (SEE Mental Disorder, Neurosis, Psychosis)

Delusion (SEE Mental Disorder, Neurosis, Psychosis)

Demographic Variables (SEE Population Characteristics)

Denial (SEE Defense Mechanism)

Dependency

3619, 3970, 3980, 4002, 4120, 4127, 4151, 4158, 4238, 4274, 4277, 4287, 4375, 4566, 4672, 4835, 5043, 5102, 5163

Depression (see also Emotion, Emotional Disturbance)

3372, 4361, 4369, 4439, 4444, 4458, 4460, 4527, 4547, 4548, 4567, 4613, 4621, 4627, 4631, 4640, 4668, 4670, 4903

Deprivation (see also Deprivation/Sensory, Food Deprivation, Isolation, Rat/Deprivation in)

3393, 3402, 3622, 3645, 3815, 3882, 4589, 4620, 4647

Deprivation/Sensory

3435, 4225, 4322, 4337

Depth Perception (SEE Perception/Depth)

Desegregation (SEE Integration)

Desensitization Therapy (SEE Behavior Therapy)

Detection

3262, 3279, 3375, 4161, 5118, 5163, 5173

Developing Countries (SEE Cultures & Countries)

Development (see also Childhood/Development in, Language Development, Maturation)

3219, 3509, 3812, 3813, 3898, 4017, 4020, 4214, 4558

Dexterity (SEE Hand, Motor Performance)

Diabetes (SEE Blood, Disease)

Diagnosis (see also Psychodiagnosis, Schizo-

phrenia/Diagnosis of, Mental Retardation/Diagnosis of)

3525, 4209, 4340, 4709, 4714, 4718, 4719, 4739, 4741, 4748, 4752, 4759, 4763, 4766, 4775, 4776, 4781, 4921, 4948, 5055

Diagnosis/Differential

4522, 4537, 4539, 4547, 4550, 4554, 4634, 4709

Dial (SEE Display)

Diet (SEE Food)

Differential Reinforcement at Low Rates of Responding (SEE Reinforcement Schedule)

Digestive System (see also Metabolism)

3509, 3535, 3553, 3554, 3560, 3572, 3609, 3614, 3660, 3704, 3717, 3733, 3742, 3744, 3749, 3757, 3763, 3773, 3798, 3800, 3801, 3802, 3843, 4621, 4823, 4830, 4839, 4840

Digit (SEE Number)

Disability (SEE Physical Handicap)

Disarmament (SEE War, International Relations)

Discrimination (see also Auditory Discrimination, Learning/Discrimination, Visual Discrimination, Rat/Discrimination in)

3203, 3435, 3445, 3568, 3851, 3852, 3853, 3938, 4159, 4707, 4808, 4810, 4972, 5075

Discrimination Learning (SEE Learning/Discrimination)

Discrimination Reversal

3434, 3811, 3860, 3929, 4722

Discrimination/Racial (SEE Integration, Prejudice, Social Movements)

Disease (see also Illness)

3774, 3785, 4430, 4470, 4570, 4665, 4675, 4678, 4744, 4761, 4823, 4825, 4826, 4828, 4829, 4831, 4838

Displacement (SEE Defense Mechanism)

Display (see also Control)

3343, 5142, 5166, 5170, 5171

Dissonance (see also Attitude Change)

4091, 4098

Distance (SEE Perception/Depth)

Distraction (SEE Attention)

Diurnal Rhythms (SEE Biological Rhythms)

Divorce (SEE Marital Problems)

DNA (SEE Biochemistry)

Dog

3536, 3548, 3553, 3554, 3628, 3707, 3749, 3757, 3798

Dogmatism (SEE Authoritarianism, Personality Trait)

Dominance (see also Authoritarianism)

3813, 3817, 3874, 4065, 4072, 4915

Double Blind Design (SEE Experimental Design)

Down's Syndrome (SEE Genetics, Mental Retardation)

Draft (SEE Military)

Draw-A-Man Test (SEE Projective Technique)

Draw-A-Person Test (SEE Projective Technique)

Drawing (see also Aesthetics, Creativity, Picture)

3314, 4044, 4268, 4525, 4783, 4921, 5118

Dream & Dreaming (see also Rapid Eye Movement, Sleep)

3207, 3381, 3382, 3389, 3692, 4235, 4373, 4493, 4702, 4828

Drinking (SEE Alcohol, Water & Water Intake)

Drive (SEE Motivation)

Driving (see also Safety)

4563, 4688, 5090, 5172, 5174

DRL (SEE Reinforcement Schedule)

Dropout (SEE School Dropout)

Drug Addition (see also Drug Effects, Drugs)

4202, 4207, 4453, 4529, 4556, 4559, 4560, 4561, 4562, 4858

Drug Effects (SEE next headings, Drug Addiction)

Drug Effects-Animal (see also Rat/Drug Effects in, Cat/Drug Effects in, Drugs)

3553, 3663, 3669, 3707, 3709, 3716, 3718, 3719, 3720, 3721, 3724, 3726, 3729, 3730, 3737, 3738, 3739, 3740, 3743, 3745, 3746, 3748, 3749, 3750, 3751, 3752, 3755, 3756, 3757, 3760, 3761, 3762, 3763, 3764, 3766,

3767, 3769, 3772, 3774, 3789

Drug Effects-Human (see also Drug Addiction, Drugs)

3683, 3684, 3685, 3686, 3687, 3688, 3689, 3690, 3691, 3692, 3693, 3694, 3695, 3696, 3697, 3699, 3700, 3701, 3702, 4202, 4573, 4840

Drug Therapy

3698, 4361, 4371, 4434, 4435, 4436, 4437, 4438, 4439, 4440, 4441, 4442, 4443, 4444, 4446, 4447, 4448, 4449, 4450, 4451, 4452, 4453, 4454, 4455, 4456, 4457, 4458, 4459, 4460, 4461, 4462, 4561, 4568, 4570, 4594, 4627, 4639, 4779, 4780, 4824

Drug Therapy-Schizophrenia

4448, 4517, 4639, 4659, 4661, 4662, 4663, 4664

Drug Usage & Abuse (see also Drug Addiction, Drugs)

4099, 4199, 4200, 4202, 4203, 4205, 4207, 4208, 4209, 4210, 4211, 4213, 4319, 4448, 4559, 4562, 4979

Drugs (see also Amphetamine, Antidepressant Drugs, Chlorpromazine, Lysergic Acid Diethylamide, Marihuana, Tranquilizer)

3661, 3665, 3688, 3695, 3724, 4319, 4426, 4453, 4697, 4926

Dyad (SEE Group/Small, Interpersonal Processes)

Dyslexia (SEE Reading Deficiency)

Ear (see also Audition)

3354, 3358, 3647, 4712, 4720, 4735

Eating (SEE Food, Food Intake)

Ecology (SEE Environment)

Education (see also next headings, College, Curriculum, School, Teaching, Training)

3237, 4008, 4016, 4065, 4864, 4865, 4866, 4868, 4871, 4872, 4875, 4882, 4989, 4992, 4993, 5000, 5077, 5129

Education/Adult (SEE Education)

Education/Physical

3965, 4035, 4363, 4726, 4947, 5109

Education/Programs in

3969, 4208, 4866, 4881, 4897, 4906, 4923, 4933, 4956, 4967, 5006, 5011, 5041, 5057, 5064, 5067, 5069, 5073, 5076, 5079, 5082, 5085, 5089, 5105

Education/Special

3918, 4704, 4707, 4871, 4933, 4935, 4936, 4937, 4938, 4942, 4943, 4948, 4953, 4956, 4964, 4965, 4967, 4968, 4969, 4995, 5003, 5073

Education/Special-Mental Retardation (see also Mental Retardation/Learning in)

4782, 4788, 4936, 4945, 4946, 4947, 4949, 4950, 4951, 4954, 4955, 4957, 4958, 4959, 4960, 4961, 4962, 4963, 5004

Education/Special-Remedial

4940, 4941

Educational Background

4025, 4076, 4084, 4467, 4542, 4593, 4608, 5035

Educational Guidance (SEE Guidance/Educational)

Educational Measurement (see also Test/Achievement)

4600, 4910, 4911, 4912, 4913, 4914, 4916, 4917, 4923, 4924, 4925, 4927, 4928, 4929, 4931, 4961, 5007, 5062

Educational Psychology

4861, 4865, 4866, 4869, 4873, 4875, 4987, 4989

Edwards Personal Preference Schedule (SEE Test/Personality)

Effort (SEE Work & Work Analysis)

Ego (see also Self)

3444, 3893, 4167, 4214, 4235, 4243, 4296, 4367, 4388, 4393, 4497, 4513, 4531, 4629, 4634, 4636, 4642

Electrical Activity (see also Potential/Evoked)

3348, 3519, 3520, 3521, 3524, 3531, 3535, 3537, 3538, 3541, 3543, 3545, 3546, 3550, 3556, 3557, 3577, 3607, 3609, 3610, 3611, 3612, 3614, 3616, 3617, 3618, 3621, 3622,

BRIEF SUBJECT INDEX

- 3623, 3624, 3625, 3626, 3627, 3628, 3629, 3630, 3631, 3632, 3633, 3634, 3635, 3636, 3639, 3650, 3653, 3654, 3718, 3738, 3748, 3750, 3751, 3762, 3771, 3788, 3798, 3800, 4623, 4752, 4763, 4777
- Electrocardiogram** (SEE Electrophysiology, Cardiovascular Processes, Heart)
- Electroconvulsive Shock**
3593, 3598, 3600, 3604, 3605, 3715, 3746, 4627
- Electroconvulsive Shock Therapy**
4323, 4361, 4426, 4427, 4659, 4662
- Electrode** (SEE Electroencephalography, Electrical Activity)
- Electrodermal Response** (SEE Galvanic Skin Response)
- Electroencephalography** (see also Arousal)
3208, 3506, 3510, 3529, 3620, 3637, 3638, 3643, 3691, 3692, 3781, 4449, 4632, 4647, 4762, 4777, 4780
- Electroencephalography-Animal**
3611, 3642, 3645, 3729, 3751, 3752, 3769
- Electromyography** (see also Eye Movement, Muscle)
3506, 3508, 3519, 3608, 3613, 3620, 3632, 3718, 3748
- Electrophysiology**
3506, 3511, 3517; 3579, 3585, 3607, 3617, 3619, 3620, 3633, 3635, 3636, 3644, 3653, 3888
- Electroretinography** (SEE Electrophysiology, Retina)
- Elimination**
3521, 3809, 3819, 3835, 3839, 4299, 4371, 4531, 4821
- Embedded Figures** (SEE Test/Intelligence, Dependency)
- Embryo** (see Pregnancy)
- Emotion** (see also Affect, Depression)
3204, 3270, 3394, 3422, 3513, 3514, 3689, 3769, 3780, 3794, 3796, 3831, 3943, 3953, 3977, 3981, 4006, 4069, 4087, 4088, 4098, 4155, 4165, 4180, 4213, 4324, 4445, 4485, 4494, 4497, 4511, 4529, 4567, 4621, 4640, 4694, 4794, 4827, 4829, 4834, 4835, 4838, 4893, 4898, 4926, 5108, 5146
- Emotional Disturbance** (see also Childhood/Emotional Disturbances in)

- Facial Expression** (SEE Communication/Non-verbal, Social Perception)
- Factor Analysis** (see also Correlation)
3238, 3245, 3246, 3247, 3251, 3393, 3998, 4006, 4190, 4226, 4229, 4278, 4621, 4776, 4908, 4919, 4923, 4925, 4993, 5034
- Faculty** (SEE Teacher)
- Failure** (SEE Achievement, Emotion, Anxiety)
- Faking** (SEE Deception)
- Familiarity** (see also Experience, Practice)
3291, 3395, 3396, 3414, 3426, 3466, 3483, 3485, 3683, 3830, 3833, 3910, 4037, 4070, 4088, 5083
- Family** (see also next headings, Marriage, Mother, Father)
4059, 4219, 4232, 4244, 4492, 4552, 4593, 4625, 4638, 4643, 4687, 4719, 4851, 4898, 5018, 5036, 5043
- Family Planning** (SEE Birth Control)
- Family Relations** (see also Parent-Child Relations)
3918, 4058, 4060, 4205, 4531, 4656, 4667
- Family Therapy**
4321, 4399, 4430, 4570, 4851
- Fantasy** (see also Dream & Dreaming, Imagery)
3389, 4373, 4391, 4579
- Farming** (SEE Rural Environment, Occupation)
- Father** (see also Parent-Child Relations)
3998, 4030, 4035, 4075, 4195, 5036
- Fatigue**
3383, 3620
- Fear** (see also Anxiety, Emotion, Motivation, Phobia, Threat)
3528, 3765, 3909
- Feeble-mindedness** (SEE Mental Retardation)
- Feedback** (see also Reinforcement)
3203, 3321, 3356, 3357, 3408, 3455, 3458, 3472, 3635, 3683, 3841, 3911, 4103, 4113, 4114, 4175, 4220, 4224, 4231, 4250, 4263, 4412, 4422, 4535, 4735, 4801, 4803, 4971, 4994, 5109, 5142, 5155
- Feeding** (SEE Food Intake)
- Feeling** (SEE Emotion)
- Femininity** (SEE Sex Role)
- Fetishism** (SEE Sexual Deviation, Sexual Disorder)
- Fetus** (SEE Pregnancy)
- Field Dependence** (SEE Dependency)
- Field Study** (SEE Research Methods, Observation)
- Fighting** (SEE Aggression, Hostility)
- Figural Aftereffect** (SEE Aftereffect)
- Figure** (SEE Stimulus, Pattern, Perception/Form & Shape)
- Film**
3922, 4116, 4412, 5108, 5166
- Fine Arts** (SEE Aesthetics, Literature, Music)
- Finger** (SEE Hand, Motor Performance, Body)
- Flam**
3593, 3791, 3806, 3837, 3841, 3878, 3881, 3887, 3889
- Flavor** (SEE Taste)
- Flicker Fusion** (SEE Vision)
- Food**
3710, 3803, 3825, 3829, 3850, 3870, 3871, 4013, 4335
- Food Deprivation**
3777, 3834, 3843
- Food Intake**
3524, 3588, 3589, 3597, 3599, 3622, 3657, 3711, 3757, 3765, 3777, 3797, 3799, 3822, 3828, 3830, 3842, 3843, 3846, 3858
- Food Preference** (SEE Food Intake)
- Forced Choice** (SEE Choice Behavior, Item, Response, Testing Methods)
- Foreign Relations** (SEE International Relations)
- Foreman** (SEE Management)

BRIEF SUBJECT INDEX

Forgetting (SEE Extinction, Learning, Memory, Retention)
Form Perception (SEE Perception/Form & Shape)
Foster Home (SEE Family, Community Services)
France
 4044, 4159, 4283, 4515
Freud/S. (SEE Psychoanalysis, Psychoanalytic Theory)
Friendship (SEE Interpersonal Processes, Interpersonal Attraction)
Frigidity (SEE Sexual Disorder)
Frog
 3536, 3538, 3595, 3618, 3623, 3680, 3716, 3721, 3756
Frontal Lobotomy (SEE Brain Lesion, Brain Lesion-Animal)
Frustration (see also Aggression, Conflict, Emotion)
 3397, 3795, 3864, 3916, 5148
Galvanic Skin Response
 3441, 3510, 3521, 3615, 4286, 4599
Game (see also Recreation)
 3503, 3958, 4027, 4104, 4108, 4125, 4138, 4139, 4141, 4144, 4146, 4167
Game Theory (SEE Choice Behavior, Decision Making, Learning/Probability)
Gastrointestinal Processes (SEE Digestive System)
Generalization
 3433, 3856, 3926, 4188, 4472, 4681
Generalization/Stimulus (SEE Transfer, Generalization)
Genetics
 3693, 3790, 3909, 4213, 4630, 4668, 4671, 4792, 4795, 4811, 4833
Genetics-Animal
 3533, 3604, 3789, 3790, 3791, 3824, 3825, 3840, 3880
Genius (SEE Gifted)
Geriatrics (see also Gerontology)
 4471, 4527, 4539, 4857, 4859, 4860
Germany
 3996, 4044, 4048, 4055, 4057, 4159, 4311, 4319, 4405, 4637
Gerontology (see also Geriatrics)
 4009, 4010, 4013, 4014, 4015, 4016, 4017, 4308, 4858
Gestalt Psychology
 3491, 4364, 4583
Gifted
 4254, 4268, 4894, 4939
Gland (see also Epinephrine, Hormone)
 3553, 3663, 3675, 3796, 3809, 3819, 4427, 4640, 4670, 4833
Goal (SEE Motivation)
Goodenough Test (SEE Projective Technique)
Government
 4312, 4682, 4791, 4844, 4881, 5041, 5136
Grades & Grade-Point Average (SEE Achievement/Academic, Achievement/Academic-College, Achievement/Academic-Elementary School)
Grammar
 3362, 3457, 3467, 3945, 4175, 4177, 4178, 4183, 4191, 4615, 4723, 4725
Graphology (SEE Writing)
Great Britain
 4052, 4080, 4174, 4198, 4473, 4536, 4580, 4591, 4849, 4861
Group (see also next headings, Community, Culture, Interpersonal Processes)
 3875, 4020, 4111, 4113, 4114, 4119, 4123, 4125, 4133, 4140, 4151, 4159, 4164, 4889, 4897, 4900, 4906, 4964, 4971, 4971, 4973, 4984, 5051, 5114, 5154
Group Discussion
 4123, 4124, 5100
Group Dynamics
 4111, 4117, 4130, 4146, 4147, 4148, 4853, 5154
Group Influence (SEE Social Influence)
Group Structure (SEE Group, Role)

Group Therapy (SEE Psychotherapy/Group)
Group/Ethnic (SEE Ethnology)
Group/Small (see also Interpersonal Processes)
 4104, 4106, 4117, 4129, 4130, 5100
Guidance (SEE next headings, Counseling)
Guidance/Child (SEE Psychotherapy/Children, Guidance/Educational)
Guidance/Educational
 4690, 4972, 4975, 4976, 4978, 4982, 4985, 5048, 5060, 5064
Guidance/Vocational
 4690, 4914, 4974, 4982, 5060
Guilt (SEE Emotion, Motivation)
Guinea Pig (SEE Animals)
Gustation (SEE Taste)

Habit (SEE Learning, Extinction)
Habituation
 3575, 3621, 3831, 3881, 3992
Hallucination
 4317, 4337, 4568
Hallucinogen (SEE Drugs, Lysergic Acid Diethylamide)
Halo Effect (SEE Rating Scale)
Hand (see also Body, Motor Performance)
 3891
Handedness (SEE Laterality)
Handicap (SEE Childhood/Handicapped, Physical Handicap, Blindness, Deafness & Hearing Disorder)
Handling (see also Experience/Early)
 3819
Handwriting (SEE Writing)
Headache (SEE Illness)
Hearing (SEE Audition)
Hearing Loss (SEE Audition, Deafness & Hearing Disorder)
Hearing/Hard of (SEE Deafness & Hearing Disorder)
Heart (see also Blood, Blood-Animal, Blood Pressure, Cardiovascular Processes, Heart Rate)
 3536, 3538, 3609, 3629, 3688, 3704, 3712, 3721, 3730, 3744, 3779, 4838
Heart Rate
 3385, 3521, 3531, 3574, 3628, 3691, 3695, 3776, 3777, 3906, 4087, 4286, 4418, 4534, 4599, 4824
Heat (SEE Temperature)
Height (SEE Physique)
Helping Behavior (SEE Interpersonal Processes)
Heredity (SEE Genetics)
High School (SEE School, Student/High School, Adolescence)
Higher Education (SEE College)
Hippocampus
 3566, 3569, 3582, 3583, 3591, 3595, 3621, 3637, 3738, 4777
History (see also Psychology/History of)
 3202, 3509, 4192, 4196, 4198, 4483, 4488
Hoarding (SEE Instinctive Behavior)
Homicide (SEE Crime & Criminals, Suicide)
Homosexuality
 4406, 4607, 4610
Honesty (SEE Deception)
Hormone (see also Epinephrine)
 3515, 3548, 3553, 3561, 3588, 3631, 3659, 3663, 3667, 3668, 3669, 3670, 3671, 3672, 3673, 3674, 3675, 3676, 3677, 3678, 3679, 3680, 3681, 3682, 3742, 3745, 3773, 3786, 3791, 3796, 3819, 3850, 3883, 4427, 4439, 4627, 4640, 4670, 4771, 4833
Hospital & Hospitalization (see also Clinic, Institution & Institutionalization, Mental Hospital & Hospitalization)
 4320, 4340, 4402, 4470, 4472, 4477, 4832, 4834, 4859, 5157
Hostility (see also Aggression)
 4072, 4107, 4116, 4279, 4494
Hue (SEE Color)
Human Engineering (SEE Engineering Psychology)
Humor (see also Literature, Language, Emotion)

tion)
 4103, 4155, 4245, 4271
Hunger (SEE Food Deprivation, Motivation)
Husband (SEE Marriage)
Hypnosis
 3207, 3382, 3385, 3386, 3387, 3388, 3389, 3390, 4241, 4339, 4373, 4677, 4679
Hypnotherapy (SEE Hypnosis, Psychotherapy/Methods in)
Hypothalamus
 3524, 3567, 3571, 3580, 3581, 3584, 3588, 3589, 3592, 3597, 3599, 3606, 3631, 3670, 3678, 3753, 3769, 4771, 4777
Hysteria & Hysterics (see also Mental Disorder, Neurosis, Psychosis)
 4678, 4679
Id (SEE Psychoanalytic Theory)
Identification
 3361, 3499, 3500, 3920, 3987, 4004, 4071, 4283, 4977, 5033
Identity
 3943, 4009, 4032, 4167, 4902
Illegitimate Pregnancy (SEE Pregnancy, Mother)
Illness (see also Disease)
 4317, 4320, 4561, 4666, 4695, 4709, 4823, 4825, 4828, 4830, 4832, 4833, 4835, 4836, 4840
Illumination (SEE Brightness, Environment)
Illusion
 3287, 3288, 3289, 3290, 3291, 3292, 3293, 3294, 3300, 3329, 3331, 3349, 3400, 4025, 4045, 4337
Image (see also Self-Perception, Social Perception, Body)
 3335, 3352, 4373
Imagery
 3389, 3484, 4046, 4190, 4263, 4269, 4275, 4362, 4702, 4774
Imagination (SEE Fantasy, Cognition, Thinking)
Imitation (see also Instinctive Behavior, Interpersonal Processes, Model)
 3993, 4058, 4162
Impression Formation (SEE Social Perception)
Imprinting (SEE Instinctive Behavior, Experience/Early)
Incentive (see also Motivation, Reward, Reinforcement)
 3470, 4091, 4146, 5146, 5150
Incest (SEE Sexual Deviation)
Incidental Learning (SEE Learning)
Income (SEE Money, Socioeconomic Status)
Independency (SEE Dependency)
India
 3448, 3803, 4029, 4030, 4036, 4048, 4054, 4057, 4143, 4198, 4201, 4287, 4293, 4880, 5072
Indian/American (SEE Ethnology)
Individual Differences
 3206, 3231, 3299, 3311, 3406, 3408, 3501, 3517, 3521, 3621, 3840, 3908, 4225, 4233, 4241, 4913, 4957, 5080, 5112, 5134, 5163
Industrial Psychology (see also Business, Personnel/Industrial)
 5139, 5168
Industry (SEE Business, Personnel/Industrial)
Infancy (see also Neonate)
 3219, 3649, 3684, 3815, 3844, 3897, 3902, 3905, 3906, 3907, 3909, 3910, 3911, 3946, 3992, 4213, 4317, 4324, 4335, 4455, 4596, 4770
Influence (SEE Interpersonal Influence, Persuasion, Social Influence)
Information (see also Communication, Information Theory, Language)
 3214, 3240, 3278, 3296, 3358, 3416, 3439, 3440, 3442, 3454, 3460, 3462, 3476, 3492, 3494, 3913, 3936, 3952, 4142, 4145, 4147, 4148, 4171, 4172, 4190, 4225, 4250, 4253, 4258, 4355, 4424, 4805, 5142, 5166
Information Retrieval (SEE Information, Computer)
Information Theory (see also Information)

BRIEF SUBJECT INDEX

- 3838, 3927, 4171
Inheritance (SEE Genetics)
Inhibition (see also Extinction, Interference)
 3443, 3479, 3546, 3554, 3563, 3564, 3582,
 3588, 3589, 3598, 3599, 3602, 3612, 3663,
 4245
Inkblot (SEE Projective Technique, Rorschach
 Test)
Insect
 3616, 3808, 3823, 3830, 3851, 3858, 3873,
 3883
Insecurity (SEE Dependency, Neurosis)
Insight (SEE Problem Solving, Thinking,
 Self-Perception, Social Perception, Thera-
 peutic Process)
Instinctive Behavior (see also Sexual Behav-
 ior-Animal)
 3559, 3672, 3807, 3808, 3809, 3813, 3815,
 3823, 3824, 3825, 3826, 3827, 3828, 3837,
 3873, 3875, 3885, 3886, 3911, 4189
Institute (SEE Organizations, College)
Institution & Institutionalization (see also
 Hospital & Hospitalization, Mental Hospi-
 tal & Hospitalization)
 3981, 4004, 4471, 4587, 4628, 4696, 4788,
 4794, 4797, 4806, 4821, 4841, 4859
Instruction (see also Teaching)
 3248, 4934, 5096
Instructions/Experimental
 3292, 3307, 3382, 3391, 3394, 3417, 3438,
 3453, 3474, 3615, 3916, 3995, 4045, 4153,
 4273, 4294, 4298, 4803, 4930
Insulin (SEE Hormone)
Insulin Shock Therapy (SEE Therapy)
Integration
 4075, 4140, 5066
Intellectual Processes (SEE Cognition, Think-
 ing)
Intelligence (see also next headings)
 3803, 3917, 3959, 3974, 3996, 4154, 4233,
 4256, 4264, 4278, 4696, 4738, 4745, 4747,
 4773, 5018, 5026, 5035, 5076, 5084, 5087
Intelligence Quotient
 3495, 3495, 3984, 4001, 4059, 4249, 4257,
 4546, 4792, 4800, 5015, 5056
Intelligence Tests & Testing (SEE Test/
 Intelligence)
Intensity (SEE Stimulus Intensity, Shock &
 Shock Intensity)
Interest (see also Motivation)
Interest/Vocational (SEE Occupational Inter-
 est)
Interference
 3261, 3305, 3312, 3358, 3364, 3401, 3418,
 3445, 3452, 3476, 3479, 3480, 3486, 3488,
 3508, 3912, 4160, 4175, 4184, 4185, 4191,
 4735, 5044
Internal-External Control (SEE Control/In-
 ternal-External)
International Relations
 4086, 4140
Interpersonal Attraction
 4112, 4118, 4122, 4136, 4139, 4144, 4169
Interpersonal Influence
 3952, 4008, 4110, 4129, 4142, 4144, 4147,
 4155, 4221, 4864, 4888, 5009, 5097
Interpersonal Perception (SEE Social Percep-
 tion)
Interpersonal Processes (see also Interpersonal
 Attraction, Interpersonal Influence, Group,
 Social Processes, Family Relations)
 3531, 3991, 4007, 4047, 4103, 4104, 4105,
 4106, 4108, 4109, 4112, 4113, 4115, 4116,
 4119, 4120, 4121, 4124, 4126, 4126, 4128,

 4990, 5006, 5012, 5016
Isolation (see also Alienation)
 3709, 3759, 3837, 4009, 4102, 4141, 4291,
 4423, 4620, 5159
Israel
 4050
Item (see also Test & Testing, Testing Meth-
 ods)
 3245, 3258, 3967, 4082, 4143, 4258, 4285,
 4700, 4913, 4927, 4929
Japan
 4047, 4048, 4051, 4052, 4316
Jew (SEE Religion, Ethnology)
Job (SEE next headings, Occupation, Per-
 sonnel/Industrial, Work & Work Analysis)
Job Evaluation (SEE Occupation, Work &
 Work Analysis)
Job Performance
 4991, 5003, 5004, 5120, 5129, 5137, 5138,
 5140, 5143, 5144, 5145, 5146, 5147, 5149,
 5150, 5151, 5153, 5158, 5171
Job Satisfaction
 4591, 5136, 5145, 5146, 5148, 5152, 5153,
 5155, 5172
Judgment
 3222, 3228, 3292, 3318, 3465, 3899, 3920,
 4127, 4149, 4184, 4185, 4187, 4222, 4239,
 4490, 4652, 4875, 5140
Judgment/Perceptual (see also Perception, the
 various senses)
 3278, 3308, 3347, 3351, 3357, 3378, 3654,
 4767
Junior College (SEE College)
Junior High School (SEE School, Student/
 Junior High School)
Juvenile Delinquency (SEE Delinquency/
 Juvenile)
Kibbutz/Israel (SEE Israel)
Kindergarten (SEE Childhood/Preschool)
Kinesthesia (see also Movement)
 3376, 3377, 3535, 4241, 4769
Kinship (SEE Family, Culture)
Knowledge of Results (SEE Feedback, Rein-
 forcement, Information)
Korsakov's Psychosis (SEE Alcoholism, Brain
 Disorder)
Labor Relations (SEE Personnel/Industrial,
 Management)
Language (see also next headings, Com-
 munication, Information, Speech, Psycho-
 linguistics, Verbal Behavior)
 3240, 3305, 3450, 3454, 3457, 3473, 3514,
 3894, 3957, 4048, 4171, 4172, 4176, 4177,
 4178, 4179, 4180, 4181, 4182, 4187, 4189,
 4190, 4191, 4196, 4296, 4643, 4721, 4725,
 4768, 4807, 4870, 4940, 4953, 5026, 5082
Language Development
 3891, 3894, 3897, 3905, 3945, 3954, 3955,
 3956, 4797
Language/Foreign
 4176, 4178, 4181, 4182, 4186, 4187, 5083,
 5086, 5092, 5093, 5106
Latent Learning (SEE Learning)
Laterality
 3314, 3354, 3640, 3727, 3891, 4484, 4750
Latin America
 3904, 4398, 4782
Law (see also Government, Political Behavior)
 3283, 4199, 4211, 4315, 4564, 4585, 4587,
 4602, 4641, 5132
Leadership (see also Management)
 4062, 4111, 4143, 4164, 4873, 4888, 4988,
 5119, 5138
Learning (see also next headings, Association,
 Conditioning, School Learning, Rat/Learn-
 ing in, Monkey/Learning in, Cat/Learning
 in, Childhood/Learning in)
 3223, 3267, 3311, 3398, 3404, 3421, 3422,
 3423, 3425, 3428, 3429, 3431, 3433, 3434,
 3439, 3459, 3497, 3499, 3511, 3563, 3724,
 4100, 4148, 4162, 4233, 4424, 4616, 5023
Learning Disorders
 3928, 3949, 4868, 4934, 4935, 4938, 4948,
 4952, 4953, 4956
Learning Model (SEE Model)
Learning Set (SEE Set, Expectation)
Learning Theory
 3425, 3427, 3432, 3433, 3434, 3471, 4249,
 4369
Learning Transfer
 3339, 3421, 3452, 3493, 3583, 3778, 4706,
 5103
Learning/Avoidance (see also Rat/Avoidance
 & Avoidance Learning in)
 3573, 3598, 3655, 3710, 3726, 3789, 3847,
 3866
Learning/Discrimination (see also Discrimi-
 nation Reversal, Rat/Discrimination in)
 3426, 3432, 3433, 3434, 3811, 3848, 3855,
 3856, 3858, 3901, 3925, 4722, 4802, 4804,
 4806, 4812
Learning/Escape (SEE Escape)
Learning/Incidental (SEE Learning)
Learning/Instrumental (SEE Conditioning/
 Operant Rat/Conditioning in)
Learning/Maze (see also Rat/Maze Learning
 in)
 3789, 3840
Learning/Motor
 3407, 3408, 3586, 5109
Learning/Over (SEE Learning)
Learning/Paired Associate
 3448, 3449, 3451, 3452, 3453, 3454, 3455,
 3476, 3486, 3927, 3937, 3976, 4801, 4812,
 4951
Learning/Probability
 3420, 3424, 3475, 3502
Learning/Reversal (see also Discrimination
 Reversal)
 3857, 3901, 4036
Learning/Serial
 3426, 3427, 3447, 3465, 3469
Learning/Verbal (see also Learning/Paired
 Associate)
 3277, 3430, 3438, 3442, 3443, 3444, 3445,
 3446, 3447, 3464, 3470, 3471, 4036, 4162,
 4233, 4624, 5044
Legibility (SEE Display, Writing)
Leisure (SEE Recreation)
Lesion (see also Brain Lesion, Brain Lesion-
 Animal, Rat/Lesions in, Cat/Lesions in)
 3515, 3553, 3554, 3555, 3559, 3560, 3632,
 3663, 3676, 3677, 3716, 3749, 4756
Liberalism (SEE Political Behavior, Person-
 ality Trait)
Licensing (SEE Law)
Light (see also Brightness, Color)
 3313, 3317, 3324, 3351, 3419, 3615, 3649,
 3650, 3654, 3675, 3832, 3890
Light Adaptation (SEE Adaptation/Sensory)
Lighting (SEE Brightness, Environment)
Liking (SEE Interpersonal Attraction)
Linguistics (SEE Language, Psycholinguistics)
Listening (SEE Attention, Audition, Speech
 Perception)
Literature
 4009, 4192, 4195, 4196, 4198, 4337, 4482,
 4486, 4491, 4495, 4498, 4500, 4504, 4509,
 4513, 5099

BRIEF SUBJECT INDEX

- Lobotomy** (SEE Brain Lesion, Brain Lesion-Animal)
- Localization**
3511, 3630, 3678
- Logic** (see also Thinking)
4157
- Loneliness** (SEE Isolation, Alienation)
- Longitudinal Study** (SEE Experimental Design)
- Loudness** (SEE Audition, Noise, Sound)
- Love** (SEE Emotion)
- Lower Class** (SEE Socioeconomic Status)
- LSD** (SEE Lysergic Acid Diethylamide)
- Luminance** (SEE Brightness, Environment)
- Lying** (SEE Deception)
- Lysergic Acid Diethylamide**
3687, 3693, 3700, 3732, 3741, 4200, 4203, 4211
- MA Scale** (SEE Anxiety)
- Machine** (SEE Apparatus)
- Man-Machine Systems** (SEE Engineering Psychology)
- Management** (see also Business, Leadership)
5119, 5121, 5128, 5155, 5157, 5158
- Mania** (SEE Mental Disorder, Emotional Disturbance)
- Manic-Depressive Psychosis** (SEE Depression, Psychosis)
- Manifest Anxiety** (SEE Anxiety)
- Marijuana**
3685, 3689, 3691, 3697, 3709, 4203, 4673
- Marital Problems** (see also Family Therapy)
4060, 4593, 4688, 4694, 5018
- Marketing & Marketing Research** (SEE Consumer Behavior)
- Marriage** (see also Family, Sexual Behavior)
4012, 4029, 4108, 4112, 4473, 4693, 4694, 5004
- Masculinity** (SEE Sex Role)
- Masking** (see also Interference)
3261, 3299, 3358, 3361, 3364
- Masochism** (SEE Sexual Deviation)
- Mass Behavior** (SEE Group, Social Behavior-Human)
- Mass Media** (SEE Communication/Mass)
- Maternal Behavior** (see also Mother, Parent-Child Relations, Child Rearing)
3515, 3559, 3672, 3807, 3820, 3828, 3844
- Mathematics** (see also Number)
3491, 3949, 4734, 5053
- Mating Behavior** (SEE Sexual Behavior-Animal)
- Maturation** (see also Development)
4308
- Maudsley Personality Inventory** (SEE Test/Personality)
- Maze** (SEE Learning/Maze, Rat/Maze Learning in, Apparatus-Animal)
- Meaning** (see also Semantics)
3438, 3473, 3490, 3940, 4057, 4083, 4171, 4184, 4185, 4226, 4272, 4276, 4305, 4495, 4499
- Meaningfulness**
3312, 3360, 3361, 3447, 3448, 3469, 3485, 3493, 3912, 4089, 5044
- Measurement** (see also Educational Measurement, Scaling, Statistics)
3222, 3229, 3231, 3236, 3242, 3271, 3302, 3311, 3325, 3644, 3776, 3796, 3831, 3835, 3955, 4355, 5151
- Mediating Response** (SEE Mediation)
- Mediation**
3240, 3395, 3453, 3922
- Medicine** (see also Nursing, Physician, Surgery)
3516, 3540, 3610, 4318, 4331, 4342, 4350, 4352, 4355, 4482, 4554, 4564, 4741, 4749, 4837, 5023, 5099, 5108
- Memory** (see also Recall, Recognition, Retention)
3240, 3277, 3369, 3460, 3461, 3462, 3463, 3465, 3467, 3468, 3471, 3472, 3483, 3511, 3596, 3600, 3685, 3724, 3765, 3935, 4184, 4185, 4323, 4391, 4490, 4516, 4658, 4743, 4774, 4809, 4812
- Memory/Short Term**
3476, 3477, 3479, 3481, 3484, 3485, 3488, 3931, 3935, 4742
- Meningitis** (SEE Nervous System/Disorder of)
- Menstruation** (SEE Biological Rhythms)
- Mental Deficiency** (SEE Mental Retardation)
- Mental Development** (SEE Development)
- Mental Disorder** (see also Neurosis, Psychosis, specific disorders)
4077, 4320, 4446, 4451, 4466, 4473, 4515, 4519, 4520, 4524, 4539, 4553, 4561, 4573, 4588, 4598, 4599, 4612, 4619, 4620, 4622, 4719, 4848, 4857, 4859
- Mental Health** (see also Adjustment/Personal & Social, Community Services)
4101, 4219, 4232, 4283, 4314, 4316, 4331, 4347, 4348, 4464, 4682, 4683, 4685, 4687, 4688, 4694, 4841, 4843, 4844, 4845, 4848, 4849, 4852, 4854, 4855, 4872
- Mental Hospital & Hospitalization** (see also Hospital & Hospitalization, Institution & Institutionalization)
4223, 4345, 4375, 4404, 4429, 4463, 4466, 4467, 4468, 4473, 4474, 4476, 4478, 4521, 4522, 4536, 4564, 4619, 4625, 4662
- Mental Hospital/Programs in**
4223, 4431, 4433, 4464, 4465, 4467, 4468, 4469, 4475, 4686, 4798
- Mental Hygiene** (SEE Mental Health)
- Mental Patient** (SEE Psychiatric Patient)
- Mental Processes**
3206, 3383, 3431, 3489, 3689, 3709, 3796, 4260, 4336, 4362, 4442, 4506, 4805, 4925
- Mental Retardation** (see also next headings, Learning, Learning Disorders)
3946, 4335, 4621, 4668, 4671, 4703, 4718, 4755, 4774, 4782, 4783, 4784, 4785, 4786, 4787, 4788, 4789, 4791, 4792, 4793, 4794, 4795, 4796, 4797, 4799, 4800, 4811, 4812, 4815, 4816, 4820, 4821, 4868, 4933, 4946, 4959, 4995
- Mental Retardation/Diagnosis of**
4709, 4782, 4790
- Mental Retardation/Education in** (SEE Education/Special-Mental Retardation)
- Mental Retardation/Learning in**
4782, 4801, 4802, 4803, 4804, 4805, 4806, 4807, 4808, 4809, 4810, 4811, 4812, 4813, 4949, 4951, 4959
- Mental Retardation/Treatment of**
4782, 4784, 4786, 4795, 4798, 4821
- Mental Retardation/Vocational Rehabilitation & Training in**
4782, 4798, 4801, 4813, 4814, 4815, 4816, 4817, 4818, 4819, 4820, 4822
- Meprobamate** (SEE Tranquilizer)
- Metabolism**
3571, 3658, 3686, 3712, 3730, 3744, 3745, 3763, 4439, 4445, 4446, 4455, 4742
- Method & Methodology** (see also Research Methods, Teaching Methods, Experimentation, Measurement, Survey, Experimental Design)
3221, 3234, 3235, 3238, 3241, 3254, 3302, 3367, 3378, 3494, 3613, 3630, 3643, 3644, 3776, 3862, 4028, 4096, 4206, 4270, 4875, 5158, 5161
- Metropolitan Area** (SEE Urban & Suburban Environment)
- Middle Age** (SEE Adulthood)
- Migration** (SEE Social Processes)
- Milieu Therapy** (SEE Mental Hospital/Programs in, Psychotherapy/Methods in)
- Military** (see also Personnel/Military)
3275, 4222, 5141, 5165
- Mind** (SEE Cognition, Thinking)
- Minnesota Multiphasic Personality Inventory** (MMPI)
4069, 4098, 4284, 4292, 4295, 4296, 4297, 4299, 4416, 4518, 4522, 4534, 4542, 4545, 4547, 4560, 4567, 4607, 4700, 4731, 5100, 5147
- Minority Group** (SEE Ethnology)
- MMPI** (SEE Minnesota Multiphasic Personality Inventory)
- Mobility** (SEE Movement, Social Mobility, Socioeconomic Status)
- Model** (see also Imitation)
3223, 3224, 3243, 3246, 3248, 3359, 3468, 3497, 3501, 3502, 3913, 3922, 3923, 3947, 3952, 3993, 4095, 4117, 4125, 4126, 4138, 4152, 4421, 4558, 5011, 5038, 5112, 5115, 5135, 5141, 5144
- Money**
3392, 4011, 4124, 4129, 4146, 4363, 4682, 4791, 4844, 4881, 4966, 5150
- Mongolism** (SEE Mental Retardation)
- Monitoring** (SEE Detection, Attention)
- Monkey**
3219, 3264, 3528, 3555, 3611, 3632, 3642, 3645, 3677, 3682, 3719, 3720, 3813, 3815, 3877, 3882, 3884
- Monkey/Learning in**
3720, 3848, 3853, 4279
- Mood** (SEE Emotion)
- Morale** (SEE Job Satisfaction, Attitude, Emotion)
- Morality** (SEE Value & Values, Religion, Ethics)
- Mother** (see also Maternal Behavior, Mother-Child Relations, Parent)
3684, 3822, 3877, 3882, 3998, 4004, 4030, 4060, 4061, 4068, 4069, 4075, 4085, 4299, 4324, 4596, 4655, 4672, 4697, 4795, 4834, 5079
- Mother-Child Relations** (SEE Parent-Child Relations, Child Rearing)
- Motion** (SEE Movement)
- Motion Pictures** (SEE Film)
- Motivation** (see also next headings, Achievement Motivation, Incentive, Reinforcement)
3323, 3391, 3392, 3395, 3396, 3397, 3470, 3513, 3514, 3710, 3794, 3934, 4111, 4137, 4155, 4159, 4161, 4165, 4205, 4213, 4237, 4325, 4481, 4918, 4954, 5077, 5139, 5144, 5148
- Motivation-Animal** (see also Rat/Motivation in)
3622, 3829, 3887
- Motivation/Learning** (SEE Learning, Motivation)
- Motivation Theory**
4213
- Motor Disorder**
- Motor Learning** (SEE Learning/Motor)
- Motor Performance**
3260, 3353, 3376, 3377, 3406, 3407, 3409, 3410, 3411, 3431, 3458, 3508, 3528, 3700, 3891, 3910, 3917, 3964, 3965, 3966, 4622, 4722, 4738, 4745, 4746, 4747, 4755, 5171
- Motor Processes** (see also Learning/Motor, Muscle)
3388, 3407, 3410, 3411, 3532, 3546, 3568, 3698, 3718, 3760, 3767, 3800, 4290, 4773, 4789, 4806, 4948, 5037, 5085
- Motor Skill** (SEE Motor Performance)
- Mouse**
3515, 3533, 3563, 3598, 3636, 3673, 3709, 3726, 3737, 3739, 3740, 3743, 3746, 3752, 3760, 3761, 3766, 3767, 3772, 3774, 3785, 3789, 3804, 3840
- Mouth** (SEE Body)
- Movement** (see also Social Movements)
3275, 3283, 3290, 3293, 3294, 3296, 3304, 3315, 3318, 3319, 3320, 3326, 3400, 3409, 3891, 4163, 4704
- Movement/Apparent** (SEE Gestalt Psychology, Visual Perception)
- Muller-Lyer Illusion** (SEE Illusion)
- Multiple Sclerosis** (SEE Disease, Nervous System/Disorder of)
- Murder** (SEE Crime & Criminals)
- Muscle** (see also Electromyography)
3285, 3390, 3505, 3508, 3548, 3608, 3625, 3632, 3661, 3669, 3681, 3730, 3735, 3739, 3917, 4286, 4418, 4754
- Muscle Sense** (SEE Kinesthesia, Somesthesia)
- Music**
3360, 3912, 4652, 5046, 5075, 5087, 5088
- Mutism** (SEE Speech/Defective)
- Myth & Mythology** (SEE Culture)

BRIEF SUBJECT INDEX

- Narcissism** (SEE Psychoanalytic Theory, Neurosis, Personality Trait)
- Narcosis** (SEE Sleep, Drug Therapy)
- Narcotics** (SEE Drugs, Drug Addiction)
- Natural Observation** (SEE Observation)
- Navy** (SEE Military, Personnel/Military)
- Need** (see also Motivation)
4109, 4136, 4228, 4233, 4236, 4385, 4558, 4986, 5066, 5081, 5112, 5120, 5155
- Need Achievement** (SEE Achievement Motivation)
- Negro**
3896, 3902, 3925, 3944, 3951, 3968, 3970, 3987, 3994, 4033, 4034, 4035, 4055, 4057, 4059, 4073, 4075, 4102, 4335, 4683, 4713, 4842, 4868, 4886, 4891, 4897, 4906, 4907, 4923, 4932, 4940, 5006, 5018, 5020, 5029, 5037, 5050, 5066, 5071, 5073, 5079, 5110
- Neonate** (see also Infancy)
3219, 3671, 3674, 3903, 3904, 4324, 4596, 4839
- Nerve** (SEE Neurology, Neuroanatomy)
- Nervous System** (see also next headings)
3525, 3652
- Nervous System/Autonomic**
3536, 3538, 3548, 3554, 3625, 3628, 3669, 3679, 3701, 3717, 3718, 3721, 3733, 3736, 3742, 3748, 3763, 3764, 3769, 3770, 3773, 3793, 4418, 4599
- Nervous System/Central**
3532, 3544, 3549, 3556, 3557, 3564, 3574, 3616, 3623, 3627, 3687, 3735, 3739, 3764, 4748
- Nervous System/Disorder of**
3217, 3533, 3539, 3774, 4317, 4328, 4440, 4676, 4700, 4738, 4739, 4740, 4741, 4744, 4745, 4746, 4747, 4748, 4749, 4750, 4751, 4752, 4753, 4754, 4755, 4758, 4760, 4761, 4762, 4769
- Neuroanatomy**
3552
- Neuroanatomy-Animal**
3549, 3552, 3603, 3723
- Neurology**
3199, 3217, 3404, 3506, 3509, 3513, 3514, 3522, 3523, 3525, 3526, 3529, 3530, 3532, 3534, 3539, 3540, 3541, 3543, 3545, 3551, 3610, 3652, 3661, 3662, 3701, 3781, 3903, 4311, 4675, 4739, 4740, 4741, 4744, 4756, 4762, 4765, 4770, 4772, 4775, 4777
- Neurology-Animal**
3527, 3528, 3533, 3535, 3536, 3537, 3538, 3542, 3543, 3544, 3546, 3548, 3549, 3550, 3554, 3556, 3557, 3558, 3574, 3577, 3606, 3608, 3610, 3622, 3623, 3627, 3628, 3653, 3655, 3669, 3670, 3679, 3680, 3703, 3721, 3730, 3738, 3744, 3745, 3754, 3756, 3762, 3788
- Neuron** (SEE Neurology, Neuroanatomy)
- Neurophysiology** (SEE Neurology, Neuroanatomy)
- Neurosis & Neuroticism** (see also specific neuroses)
3281, 4009, 4201, 4312, 4322, 4383, 4450, 4461, 4477, 4510, 4514, 4518, 4522, 4531, 4547, 4553, 4599, 4614, 4623, 4629, 4630, 4631, 4632, 4633, 4642, 4719, 4831
- News & Newspaper** (SEE Communication/Mass)
- Nicotine** (SEE Smoking, Drugs, Biochemistry)
- Nitritating Membrane** (SEE Eye, Conditioning/Eyelid)
- Noise** (see also Audition, Sound)
3261, 3354, 3358, 3361, 3363, 3402, 3474, 3907, 4688, 5168
- Nondirective Therapy** (SEE Psychotherapy/Methods in)
- Nonsense & Nonsense Syllables** (SEE Association, Learning/Pairing Associate, Word)
- Nonverbal Communication** (SEE Communication/Nonverbal)
- Noradrenalin** (SEE Hormone)
- Norepinephrine** (SEE Hormone)
- Norm** (see also Value & Values, Social Influence)
4049
- Novelty** (SEE Familiarity)
- Number** (see also Mathematics)
3322, 3401, 3491, 3895, 3930, 3939
- Nursery School** (SEE Childhood/Preschool)
- Nursing & Nurses** (see also Medicine, Personnel/Psychological)
3444, 4236, 4261, 4343, 4350, 4466, 4521, 4538, 4565, 4718, 4834, 5143
- Nutrition** (SEE Food)
- Nystagmus** (SEE Eye Movement)
- Obesity** (SEE Physique)
- Obituaries**
3199
- Observation**
3264, 3391, 3806, 3807, 3817, 3824, 3844, 3876, 3922, 4116, 4162, 4910, 4990
- Obsession-Compulsion** (see also Mental Disorder, Neurosis, Psychosis, Personality Trait)
4420, 4459, 4461, 4630, 4674, 4792
- Occupation** (see also Personnel/Industrial, Work & Work Analysis)
4039, 4061, 4076, 4085, 4234, 4319, 4356, 4639, 4785, 4872, 4914, 5120, 5121, 5122, 5127, 5129, 5130, 5144, 5147
- Occupational Choice** (see also Guidance/Vocational)
3999, 4213, 4974, 4982, 5123
- Occupational Interest**
4004, 4281, 4975, 4977, 4982, 5005, 5050, 5122, 5123
- Occupational & Physical Therapy**
4433, 4521
- Oceanography** (SEE Environment)
- Oedipus** (SEE Psychoanalytic Theory)
- Old Age** (SEE Geriatrics, Gerontology)
- Olfaction** (SEE Smell)
- Open-Field Behavior** (SEE Activity, Rat/Activity in)
- Operant Behavior** (SEE Conditioning/Operant)
- Opinion** (see also Attitude)
4093, 4095, 4224, 4250
- Optic Nerve** (SEE Neurology, Neuroanatomy)
- Oral Character** (SEE Psychoanalytic Theory)
- Organ Implantation & Transplantation** (SEE Surgery)
- Organizational Structure**
4478, 4873, 5121, 5139, 5154, 5156
- Organizations**
3213, 5041
- Orientation**
3327, 3333, 3334, 3376, 3377, 3379, 3680, 3804, 3826, 3827, 3877, 3883, 3979, 4113, 4580, 4892, 5051, 5144
- Orienting Response** (SEE Orientation)
- Outpatient** (SEE Treatment/Outpatient)
- Overlearning** (SEE Learning)
- Oxygen** (SEE Respiration, Biochemistry)
- Pain** (see also Somesthesia)
3387, 3428, 3528, 3577, 3702, 3731, 3737, 3770, 4241, 4244
- Paired Associate Learning** (SEE Learning/Pairing Associate)
- Palsy** (SEE Nervous System/Disorder of, Physical Handicap)
- Paralysis** (SEE Nervous System/Disorder of, Physical Handicap)
- Paranoia** (see also Psychosis, Neurosis, Schizophrenia, Personality Trait)
4379, 4529, 4560, 4568, 4644, 4654, 4669
- Parapsychology**
3203, 3204, 3205, 3206, 3207, 3208, 3209, 4589
- Parent** (SEE Father, Mother, Parent-Child Relations)
- Parent-Child Relations** (see also Family Relations)
3963, 3996, 3997, 3998, 4002, 4008, 4035, 4061, 4073, 4262, 4485, 4555, 4577, 4589, 4596, 4601, 4672, 4687, 4699, 4729, 4794, 4816, 4977, 5009, 5021, 5035
- Parkinson's Disease** (SEE Nervous System/Disorder of)
- Pastoral Counseling** (SEE Counseling)
- Paternal Deprivation** (SEE Father, Parent-Child Relations)
- Pathogenesis** (SEE Etiology)
- Patient** (see also Psychiatric Patient)
3793, 4327, 4332, 4472, 4541, 4698, 4827, 4832
- Pattern**
3223, 3282, 3287, 3311, 3314, 3338, 3339, 3340, 3344, 3346, 3347, 3359, 3379, 3427, 3641, 3727, 4056, 4194, 4711
- Peace** (SEE International Relations, War)
- Peace Corps** (SEE Government, International Relations)
- Peak Experience** (SEE Emotion)
- Peer Rating** (SEE Peers)
- Peers**
3994, 4008, 4058, 4073, 4109, 4246, 4612, 4731, 4862, 4885, 4892, 4915, 4964, 5009, 5016
- Penitentiary** (SEE Prison)
- Perception** (see also next headings, Inter-sensory Processes, Childhood/Perception in)
3205, 3260, 3278, 3285, 3323, 3386, 3398, 3404, 3468, 3685, 3794, 3893, 4051, 4317, 4490, 4706, 4978, 5109
- Perception/Auditory** (SEE Auditory Perception)
- Perception/Depth**
3290, 3315, 3323, 3324, 3326, 3327, 3328, 3331, 3343, 3347, 5160
- Perception/Form & Shape**
3311, 3322, 3323, 3327, 3341, 3342, 3343, 3344, 3345, 3347, 3379, 3854, 3895, 3906, 3966, 3970, 3971, 3973, 3976, 4056
- Perception/Size**
3287, 3315, 3322, 3323, 3325, 3329, 3330, 3906, 3947, 4706
- Perception/Social** (SEE Social Perception)
- Perception/Space**
3291, 3323, 3329, 3379, 3719, 3974, 4238, 4243
- Perception/Time**
4243
- Perception/Visual** (SEE Visual Perception)
- Perception/Weight** (SEE Weight, Perception)
- Perceptual Defense** (SEE Defense Mechanism)
- Perceptual Isolation** (SEE Isolation, Deprivation/Sensory)
- Performance** (see also Job Performance, Motor Performance)
3223, 3403, 3416, 3489, 3504, 3645, 3912, 4165, 4231, 4762
- Perseveration** (SEE Personality Trait, Thinking)
- Personality** (see also next headings, Childhood/Personality in, Teacher Attitudes & Personality, the various personality traits)
3444, 3893, 3899, 3995, 4023, 4063, 4118, 4128, 4164, 4186, 4200, 4212, 4214, 4215, 4216, 4218, 4219, 4225, 4230, 4232, 4242, 4392, 4476, 4496, 4497, 4529, 4543, 4638, 4655, 4773, 4829, 4881, 5012, 5080, 5123
- Personality Change**
4000, 4114, 4223, 4477, 4760, 4904, 4973
- Personality Correlates**
3323, 3372, 3381, 3388, 3690, 3794, 3795, 3993, 4043, 4165, 4201, 4205, 4217, 4236, 4238, 4239, 4241, 4242, 4243, 4244, 4245, 4264, 4266, 4267, 4269, 4279, 4534, 4567, 4596, 4601, 4607, 4640, 4731, 4978, 4981, 5025, 5172
- Personality Diagnosis** (SEE Personality Measurement, Test/Personality)
- Personality Disorder** (SEE Emotional Disturbance, Neurosis)
- Personality Inventory** (SEE Personality Measurement)
- Personality Measurement**
3259, 4168, 4186, 4217, 4221, 4224, 4227, 4264, 4274, 4277, 4278, 4281, 4285, 4286, 4290, 4332
- Personality Test** (SEE Test/Personality)
- Personality Theory**
3211, 4975

BRIEF SUBJECT INDEX

- Personality Trait** (see also Inventory)
3372, 3430, 3795, 3933, 3938, 3977, 3982,
4042, 4110, 4162, 4168, 4215, 4220, 4221,
4222, 4224, 4229, 4233, 4237, 4240, 4241,
4274, 4279, 4280, 4396, 4422, 4597, 4666,
4713, 4877, 4979, 5040, 5063, 5095
- Personality/Assessment of** (SEE Personality
Measurement)
- Personality/Childhood** (SEE Childhood/Per-
sonality in)
- Personnel** (see also next headings)
3283, 4471, 4987
- Personnel/Industrial**
4193, 5121, 5126, 5128, 5139, 5145, 5150,
5153, 5155
- Personnel/Military**
3275, 3283, 3353, 3360, 3366, 3368, 3373,
3780, 3786, 4244, 4320, 4402, 4595, 4611,
4836, 5119, 5125, 5131, 5133, 5137, 5138,
5149, 5151, 5163, 5166
- Personnel/Psychological** (see also Counselor,
Nurse, Psychiatrist, Psychologist, Therapist)
4062, 4343, 4345, 4347, 4348, 4349, 4356,
4368, 4382, 4429, 4685, 4785, 4799, 4852
- Persuasion** (see also Interpersonal Influence,
Social Influence)
4090, 4093, 4097, 4110, 4313, 5164
- Phenomenology**
4506
- Phenylketonuria** (SEE Genetics, Mental Dis-
order, Mental Retardation)
- Philosophy** (see also Existentialism)
3200, 3202, 3210, 3518, 4019, 4023, 4024,
4038, 4251, 4314, 4506, 4508
- Phobia** (see also Anxiety, Fear)
4419, 4420, 4424, 4625, 4792, 4903
- Phoneme** (SEE Word, Language)
- Phonetics** (SEE Speech, Verbal Behavior,
Language)
- Photic** (SEE Light)
- Photograph** (SEE Picture)
- Physical Education** (SEE Education/Physical)
- Physical Handicap** (see also Blindness, Child-
hood/Handicapped, Deafness & Hearing
Disorder, Motor Disorder)
4698, 4700, 4701
- Physical Therapy** (SEE Occupational & Phys-
ical Therapy)
- Physician**
3540, 4210, 4352, 4355, 4695, 4699, 4877,
5023, 5108
- Physiological Correlates** (see also Stress/
Physiological)
3387, 3422, 3510, 3531, 3619, 3637, 3646,
3648, 3786, 3793, 4087, 4418, 4590, 4616
- Physiological Psychology**
3199, 3505, 3507, 3510, 3511, 3512, 3516,
3518, 3520, 3610, 4665
- Physiology** (see also Electrophysiology)
3199, 3269, 3509, 3513, 3516, 3518, 3520,
3530, 3558, 3610, 3762, 3787, 3880
- Physiology/Sensory** (see also Vision/Physi-
ology of)
3534, 3535, 3652, 3653, 3655
- Physique** (see also Body)
4796
- Piaget/J.** (SEE Childhood/Concepts & Prob-
lem Solving in, Childhood/Development in)
- Picture**
3465, 3792, 3972, 4194, 4252, 4301, 4302
- Picture-Frustration** (SEE Projective Tech-
nique)
- Pigeon**
3536, 3653, 3827, 3852, 3855, 3856
- Pilot** (SEE Aviation, Personnel/Military)
- Pitch** (SEE Sound, Audition)
- Pituitary** (SEE Gland, Hormone)
- PK** (SEE Parapsychology)
- Placebo** (SEE Drug Effects)
- Play** (SEE Childhood/Social Behavior in,
Game, Recreation)
- Play Therapy** (SEE Psychotherapy/Children)
- Pleasure** (SEE Emotion)
- Poisson Distribution** (SEE Statistics)
- Police** (SEE Crime & Criminals, Law)
- Political Behavior**
3202, 3210, 4038, 4063, 4489, 4682, 4865,
4866
- Politics** (SEE Political Behavior, Government)
- Pollution** (SEE Environment)
- Popularity** (SEE Interpersonal Attraction,
Social Approval)
- Population Characteristics**
4086, 4334, 4473, 4561, 4574, 4581, 4644,
4854
- Population Control** (SEE Birth Control)
- Porteus Maze** (SEE Learning/Maze, Appa-
ratus)
- Potential/Evoked** (see also Electrical Activity)
3528, 3594, 3595, 3638, 3639, 3640, 3641,
3644, 3646, 3647, 3648, 3649, 3650, 3654,
3771, 4756
- Poverty** (SEE Socioeconomic Status, Child-
hood/Disadvantaged)
- Power** (SEE Dominance, Social Influence)
- Practice**
3340, 3431, 3481, 3500, 4224, 4706
- Precognition** (SEE Parapsychology)
- Prediction** (see also Achievement/Prediction
of Academic)
3230, 3335, 3420, 3434, 3503, 3615, 3908,
4015, 4095, 4179, 4251, 4546, 4576, 4593,
4684, 4756, 4894, 4920, 4972, 4982, 5001,
5120, 5143, 5144, 5149, 5158
- Preference**
3347, 3354, 3501, 3592, 3789, 3792, 3838,
3842, 3858, 3862, 3884, 3891, 3893, 3895,
3900, 3978, 3986, 3987, 4042, 4056, 4071,
4143, 4156, 4193, 4225, 4265, 4652, 4876
- Pregnancy**
3219, 3515, 3574, 3586, 3625, 3677, 3684,
3820, 3892, 4068, 4709
- Prejudice**
4010, 4073, 4102, 4242, 4485
- Prenatal** (SEE Pregnancy)
- Preschool Children** (SEE Childhood/Preschool)
- Presentation Rate** (SEE Interval/Interstim-
ulus)
- Prestige** (SEE Socioeconomic Status)
- Prison** (see also Crime & Criminals)
3435, 4585, 4586, 4587, 4589, 4590, 4591,
4592, 4593, 4594, 4595, 4597, 4598
- Prison Inmate** (SEE Prison)
- Probability** (see also Learning/Probability,
Statistics)
3227, 3239, 3258, 3397, 3990, 4095
- Probability Learning** (SEE Learning/Prob-
ability)
- Problem Solving** (see also Choice Behavior,
Decision Making, Childhood/Concepts &
Problem Solving in)
3491, 3494, 3496, 4117, 4121, 4123, 4240,
4812
- Profile** (SEE Score & Scoring)
- Programed Instruction** (see also Teaching
Aids)
3266, 4808, 4949, 4960, 4962, 5095, 5107,
5128
- Programming** (SEE Computer)
- Projection** (SEE Defense Mechanism, Cere-
bral Cortex, Visual Cortex)
- Projective Technique** (see also Rorschach Test)
3803, 3920, 4004, 4005, 4051, 4055, 4229,
4266, 4300, 4301, 4302, 4303, 4304, 4305,
4306, 4307, 4416, 4419, 4516, 4525, 4526,
4549, 4552, 4579, 4615, 4654, 4696, 4790,
4906, 4916, 4921, 5028, 5127
- Propaganda** (SEE Communication, Commu-
nication/Mass, Persuasion)
- Proprioception** (SEE Kinesthesia, Somesthesia)
- Prostitution** (SEE Occupation, Sexual Behav-
ior)
- Protestantism** (SEE Religion)
- Psychedelic Experience** (SEE Drug Effects-
Human)
- Psychiatric Diagnosis** (SEE Psychodiagnosis)
- Psychiatric Hospital** (SEE Mental Hospital &
Hospitalization)
- Psychiatric Patient** (see also Patient)
4327, 4329, 4334, 4366, 4372, 4385, 4388,
4390, 4392, 4396, 4415, 4429, 4431, 4433,
4440, 4456, 4463, 4464, 4465, 4467, 4474,
4476, 4503, 4528, 4534, 4540, 4542, 4545,
4546, 4549, 4611, 4615, 4621, 4624, 4639,
4684, 4854
- Psychiatric Patient Treatment** (see also Case
Report-Treatment, Treatment/Outpatient)

Salt (SEE Biochemistry, Food)
Satiation (SEE Motivation)
Scale (see also Attitude Measurement, Inventory, Rating Scale, Testing Methods)
 4004, 4082, 4111, 4113, 4114, 4143, 4285, 4286, 4296, 4297, 4567, 4576, 4784, 4886, 4887, 4889, 4890, 4892, 4906, 4930, 4970, 4971, 4980, 4983, 4995, 5043, 5167
Scaling (see also Measurement)
 3222, 3232, 3241, 3252, 3346, 3811, 3955, 4280, 4652
Scanning (SEE Detection)
Schizophrenia (see also next headings)
 4314, 4321, 4383, 4529, 4560, 4617, 4619, 4644, 4645, 4647, 4649, 4650, 4651, 4652, 4653, 4663, 4669
Schizophrenia/Childhood
 4654, 4655
Schizophrenia/Chronic
 4517, 4639, 4646, 4648, 4664
Schizophrenia/Diagnosis of
 4536, 4541, 4660
Schizophrenia/Family Role in
 4653, 4655, 4656
Schizophrenia/Learning & Cognition in
 4517, 4643, 4648, 4650, 4652, 4658
Schizophrenia/Physiology of
 4448, 4657
Schizophrenia/Symptomatology of
 4642, 4656
Schizophrenia/Treatment of (see also Drug Therapy-Schizophrenia)
 4645, 4659, 4660, 4662
Scholastic Achievement (SEE Achievement/Academic)
School (see also next headings, Achievement, Classroom, College, Education)
 3300, 4874, 4956, 5000, 5064, 5079
School Achievement (SEE Achievement/Academic)
School Adjustment
 4625, 4879, 4884, 4888, 4889, 4890, 4895, 4900, 4901, 4902, 4903, 4966, 5028, 5048, 5052, 5064, 5067, 5077, 5105
School Administration
 4867, 4873, 4904, 4909, 4988, 4998, 4999, 5077
School Anxiety (SEE Anxiety, Test Anxiety)
School Dropout
 4350, 4978, 5048
School Learning (see also Achievement/Academic)
 4935, 5007, 5017, 5022, 5027, 5029, 5038, 5039, 5044, 5045, 5049, 5052, 5077, 5096, 5103, 5104, 5107, 5112, 5115
School Psychology (SEE Educational Psychology, Guidance/Educational)
School Subjects (SEE Curriculum, Mathematics, Reading)
Science & Scientists
 3254, 4190, 4251, 4331, 4499, 5005, 5023, 5072, 5144
Scientific Method (SEE Method & Methodology)
Score & Scoring
 3253, 4252, 4301, 4302, 4303, 4921, 4922, 5149
Seasonal Changes (SEE Time, Temperature, Environment)
Security (SEE Dependency)
Sedative (SEE Drugs)
Segregation (SEE Integration)
Seizure (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
Selection
 3261, 3476, 3492, 3799, 3927, 3976, 4285, 4349, 4920, 4936, 4939, 5124, 5125, 5126, 5127, 5149
Self (see also next headings)
 4000, 4105, 4137, 4213, 4223, 4290, 4296, 4583, 4701, 5040
Self-Actualization (SEE Self)
Self Concept
 4113, 4114, 4132, 4135, 4214, 4220, 4231, 4275, 4278, 4476, 4497, 4816, 4884, 4900, 4905, 4955, 4978, 4995, 5013, 5014, 5019, 5025, 5033, 5036, 5050, 5064, 5087, 5089, 5098, 5110, 5126
Self-Disclosure (SEE Interpersonal Processes)
Self-Esteem (SEE Self-Concept)
Self-Evaluation
 4204, 4206, 4289, 4298, 4567, 4908, 4915, 5129
Self-Perception
 3916, 4003, 4065, 4114, 4135, 4223, 4294, 4471, 4514, 4698, 4827, 4987, 4996, 5155, 5397, 5602, 5753
Self/Ideal (SEE Self Concept)
Self-Stimulation (SEE Motivation, Stimulation, Brain Stimulation, Rat/Brain Stimulation in)
Selling (SEE Advertising, Business, Consumer Behavior)
Semantic Differential
 4012, 4048, 4057, 4080, 4083, 4135, 4180, 4182, 4187, 4272, 4276, 4305, 4373, 4869, 4882, 5047, 5120, 5143
Semantics (see also Meaning, Meaningfulness)
 3467, 3480, 4171, 4184, 4185, 4188, 4658, 4723
Senility (SEE Geriatrics)
Sensitivity
 3215, 3338, 3356, 3374, 3651, 3655, 3888, 3889, 4101, 4111, 4113, 4119, 4135, 4231, 4277, 4648, 4900, 5162
Sensory Adaptation (SEE Adaptation/Sensory)
Sensory Deprivation (SEE Deprivation/Sensory)
Sensory Physiology (SEE Physiology/Sensory)
Sensory Processes (see also Intersensory Processes, Physiology/Sensory)
 3353, 3380, 3472, 3759, 3868, 3888, 3890, 4244, 4268, 4290, 4773
Sentence
 3362, 3467, 3490
Sentence Completion Test (SEE Projective Technique)
Serial Learning (SEE Learning/Serial)
Set (see also Expectation)
 3307, 3440, 3446, 3486, 3939, 3993, 4166, 4804
Sex
 3678, 3884, 4066, 4079, 4245, 4272, 4276, 4419, 4480, 4499, 4671
Sex Differences
 3259, 3319, 3370, 3380, 3417, 3474, 3891, 3912, 3917, 3920, 3923, 3930, 3951, 3954, 3974, 3984, 3985, 3986, 3990, 3992, 3994, 3996, 4007, 4011, 4012, 4043, 4047, 4054, 4067, 4076, 4084, 4085, 4086, 4088, 4107, 4122, 4128, 4132, 4153, 4156, 4163, 4169, 4287, 4290, 4291, 4297, 4307, 4319, 4467, 4574, 4584, 4589, 4608, 4876, 4880, 4992, 5004, 5008, 5033, 5034, 5052, 5084
Sex Differences-Animal
 3667, 3673, 3677, 3809, 3814, 3825, 3884, 3886
Sex Differences/Academic Achievement
 5019, 5024, 5033, 5085, 5102
Sex Role
 4004, 4058, 4071, 4085, 4163, 4272, 4276, 4284, 4654, 5008, 5033
Sexual Behavior
 4066, 4067, 4068, 4069, 4098, 4674
Sexual Behavior-Animal
 3555, 3567, 3631, 3663, 3667, 3672, 3674, 3676, 3677, 3680, 3682, 3791, 3873, 3876, 3878, 3880, 3883, 3885, 3887
Sexual Deviation (see also Homosexuality)
 4432, 4505, 4606, 4607, 4608, 4609
Sexual Disorder
 4670, 4677
Shape Perception (SEE Perception/Form & Shape)
Shaping (SEE Conditioning)
Sheltered Employment (SEE Rehabilitation/Vocational)
Shock & Shock Intensity (see also Electroconvulsive Shock, Brain Stimulation, Rat/Brain Stimulation in, Rat/Shock & Shock Effects in)
 3272, 3398, 3422, 3441, 3615, 3659, 3702, 3794, 3847, 4230, 4724, 5142
Shock Therapy (SEE Electroconvulsive Shock Therapy)
Shock/Electroconvulsive (SEE Electroconvulsive Shock)
Sibling (SEE Family Relations)
Signal
 3279, 3363, 3369, 3375, 3416, 3637, 4724, 5163
Similarity
 3228, 3243, 3347, 3449, 3454, 3455, 3480, 3486, 3953, 4118, 4136, 4175, 4184, 4185, 4246, 4307, 4336, 5044
Simulation (see also Model)
 3223, 3270, 3298, 3545, 3915, 4138, 4144, 4641, 4920, 5141, 5154, 5161, 5169
Size Constancy (SEE Gestalt Psychology, Visual Perception, Perception)
Size Perception (SEE Perception/Size)
Skin (see also Cutaneous Sense)
 3205, 3521, 3531, 3614, 3615, 3651, 3655, 3784, 3794, 3797
Skin Resistance (SEE Skin, Galvanic Skin Response)
Sleep (see also Dream & Dreaming, Rapid Eye Movement)
 3381, 3382, 3384, 3388, 3393, 3402, 3513, 3519, 3611, 3612, 3620, 3622, 3645, 3692, 3699, 3700, 4319, 4350, 4371, 4434, 4436, 4449, 4621, 4647, 4777, 4832
Slow Learners (SEE Learning Disorders, Mental Retardation)
Small
 3375, 3602, 3809, 3828, 3873, 3883, 4768
Smoking
 4015, 4124, 4201, 4204, 4206, 4210, 4926
Social Processes (see also next headings, Interpersonal Processes)
 3210, 4013, 4017, 4020, 4026, 4051, 4065, 4102, 4125, 4142, 4160, 4237, 4338, 4557, 4558, 4564, 4619, 4882, 4905, 5112
Social Acceptance (SEE Acceptance, Social Approval)
Social Adjustment (SEE Adjustment/Personal & Social)
Social Approval (see also Acceptance)
 3979, 3984, 3989, 4028, 4058, 4102, 4103, 4115, 4133, 4236, 4291, 4567, 4612, 4733, 4862, 4897, 4970, 5019, 5040
Social Attraction (SEE Interpersonal Attraction)
Social Behavior/Animal

BRIEF SUBJECT INDEX

- 3785, 3813, 3814, 3817, 3830, 3837, 3874, 3875, 3879, 3882, 3886
- Social Behavior/Human** (see also *Childhood/Social Behavior in*)
4006, 4020, 4031, 4105, 4112, 4128, 4132, 4314, 4578, 4701, 4968, 4970, 5115, 5159
- Social Casework**
4521, 4683, 4695, 4850, 4987
- Social Change**
3210, 4017, 4062, 4063, 4064, 4065, 4140, 4316, 4489, 4581
- Social Class** (SEE *Social Structure, Socioeconomic Status*)
- Social Deprivation** (SEE *Childhood/Disadvantaged, Socioeconomic Status*)
- Social Desirability** (SEE *Acceptance, Social Approval*)
- Social Distance** (SEE *Isolation, Social Approval*)
- Social Influence** (see also *Interpersonal Influence*)
3683, 3994, 4008, 4011, 4037, 4049, 4127, 4145, 4147, 4151, 4152, 4885, 5051
- Social Interaction**
4017, 4028, 4047, 4103, 4127, 4128, 4133, 4144, 4151, 4340, 4403, 4408, 4409, 4423, 4472, 4822, 5007
- Social Isolation** (SEE *Alienation, Isolation*)
- Social Mobility** (see also *Social Structure*)
- Social Model** (SEE *Social Processes, Social Structure*)
- Social Movements**
4064, 4321, 4866
- Social Perception**
3899, 3902, 3953, 3986, 3997, 4033, 4085, 4089, 4094, 4101, 4102, 4105, 4119, 4128, 4147, 4149, 4154, 4156, 4157, 4158, 4159, 4161, 4164, 4166, 4167, 4168, 4169, 4170, 4187, 4231, 4236, 4239, 4246, 4262, 4415, 4471, 4785, 4867, 4888, 4897, 4909, 5124
- Social Power** (SEE *Social Influence, Interpersonal Influence, Social Movements*)
- Social Psychiatry** (SEE *Psychiatry, Social Processes*)
- Social Psychology**
4018, 4021, 4022
- Social Reinforcement** (SEE *Reinforcement/Social*)
- Social Role** (SEE *Role*)
- Social Science**
3221, 4331, 5117
- Social Structure** (see also *Socioeconomic Status*)
3945, 4024, 4028, 4036, 4037, 4038, 4086, 4316, 4489, 4558, 4580, 4907
- Social Welfare** (SEE *Social Casework*)
- Socialization**
4616, 5030
- Society** (SEE *Culture*)
- Socioeconomic Status** (see also *Social Structure*)
3918, 3925, 3945, 3951, 3957, 3961, 3974, 3984, 3986, 3992, 3996, 4010, 4011, 4013, 4035, 4036, 4039, 4052, 4071, 4076, 4201, 4308, 4319, 4340, 4363, 4368, 4473, 4474, 4593, 4620, 4687, 4842, 4845, 4847, 4853, 4856, 4868, 4881, 4886, 4905, 4932, 4974, 4992, 5020, 5026, 5029, 5035, 5067, 5087, 5130
- Sociology**
3202, 4018, 4022, 4023, 4024, 4456
- Sociometric Status** (SEE *Social Approval*)
- Sociometry** (SEE *Social Approval*)
- Sociopathy** (SEE *Behavior Problems, Crime & Criminals, Antisocial Behavior*)
- Sodium Chloride** (SEE *Food, Biochemistry*)
- Soldier** (SEE *Personnel/Military*)
- Somesthesia** (see also *Kinesthesia, Cutaneous Sense*)
3376, 3377, 3378, 3426
- Sorting** (SEE *Categorical Behavior*)
- Sound** (see also *Audition, Noise*)
3304, 3309, 3353, 3355, 3360, 3361, 3364, 3369, 3374, 3480, 3640, 3889, 3907, 3962, 4189, 4650, 4711, 5088
- Space Flight** (SEE *Aviation, Environment, Simulation*)
- Space Orientation** (SEE *Orientation*)
- Space Perception** (SEE *Perception/Space*)
- Special Education** (SEE *Education/Special*)
- Speech** (see also next headings, *Verbal Behavior*)
3305, 3370, 3415, 3462, 3899, 3946, 3955, 4014, 4072, 4175, 4177, 4180, 4327, 4382, 4692, 4709, 4711, 4719, 4736, 4797, 5026, 5082, 5161
- Speech Perception**
3310, 3354, 3363, 3364, 3365, 3366, 3373, 3905, 4181, 4714, 4716, 4717
- Speech Therapy**
3946, 4726, 4732
- Speech/Defective** (see also *Speech Therapy, Stuttering*)
3946, 4681, 4703, 4721, 4722, 4723, 4725, 4727, 4730, 4731, 4733, 4734, 4743, 4768, 4936, 4953
- Speed** (SEE *Movement*)
- Spiral Aftereffect** (SEE *Aftereffect*)
- Sports** (SEE *Recreation, Education/Physical*)
- Stammering** (SEE *Stuttering*)
- Stanford-Binet Intelligence Scale** (SEE *Test/Intelligence*)
- Startle** (SEE *Response*)
- Statistics** (see also *Mathematics, Factor Analysis*)
3225, 3226, 3227, 3228, 3229, 3230, 3232, 3233, 3234, 3235, 3236, 3237, 3238, 3239, 3240, 3241, 3242, 3243, 3244, 3246, 3251, 3253, 3255, 3256, 3257, 3258, 3262, 3263, 3284, 3335, 4179, 4632, 4920, 4927, 4929
- Status** (SEE *Social Structure, Socioeconomic Status*)
- Stereotype** (see also *Attitude*)
- Stimulant** (SEE *Drugs*)
- Stimulation**
3273, 3319, 3378, 3387, 3419, 3422, 3537, 3538, 3569, 3577, 3623, 3626, 3631, 3634, 3644, 3669, 3736, 3759, 3794, 3798, 3826, 4237, 4268, 4599, 4756, 4784, 4789
- Stimulation/Central** (SEE *Brain Stimulation, Rat/Brain Stimulation in*)
- Stimulus**
3223, 3267, 3280, 3284, 3307, 3316, 3330, 3413, 3433, 3440, 3493, 3497, 3841, 3855, 3859, 3976, 4155, 4296, 4793, 4810
- Stimulus Generalization** (SEE *Generalization*)
- Stimulus Intensity** (see also *Shock & Shock Intensity*)
3297, 3433, 3839, 3863
- Strategy**
3228, 3311, 3362, 3406, 3416, 3500, 3922, 3960, 4285, 4951, 4960, 5134
- Stress** (see also *Conflict, Stress/Physiological, Rat/Stress Effects in*)
3270, 3353, 3383, 3428, 3444, 3659, 3780, 3786, 3794, 3796, 3915, 4012, 4031, 4165, 4322, 4825, 4828, 5137, 5154
- Stress/Physiological**
3385, 3755, 3788, 4931
- Stroke** (SEE *Brain Disorder, Cardiovascular Disorders*)
- Strong Vocational Interest Blank** (SEE *Occupational Interest*)
- Student** (see also next headings, *School Dropout*)
4030, 4064, 4083, 4193, 4236, 4908, 4999, 5012, 5052, 5078, 5083, 5110
- Student Attitude** (SEE *Attitude/Student*)
- Student Dropout** (SEE *School Dropout*)
- Student Protest** (SEE *Social Movements, Attitude/Student*)
- Student Teacher** (SEE *Teacher Training*)
- Student/College** (see also *Achievement/Academic-College*)
4065, 4077, 4078, 4208, 4223, 4228, 4259, 4261, 4406, 4867, 4869, 4893, 4898, 4902, 4915, 4918, 4977, 4979, 4986, 5041, 5045, 5063, 5070, 5096, 5122
- Student/College-Attitude**
4040, 4086, 4098, 4205, 4464, 4467, 4876, 4882, 4885, 4887, 4888, 4890, 4892, 4900, 4904, 4907, 4909, 5047, 5082, 5095
- Student/College-Personality**
4043, 4262, 4266, 4273, 4291, 4292, 4306, 4876, 4880, 4885, 4887, 4896, 4900, 4901, 4902, 4904, 5013, 5025, 5034, 5043, 5046, 5050, 5059, 5063, 5095, 5100, 5102
- Student/Elementary School** (see also *Childhood & Children, Achievement/Academic-Elementary School*)
3926, 3938, 3958, 3963, 3974, 3989, 4301, 4302, 4862, 4863, 4886, 4895, 4897, 4905, 4906, 4930, 4967, 4970, 4973, 4976, 4997, 5006, 5019, 5026, 5065, 5068, 5074, 5081, 5084, 5088, 5091, 5114
- Student/Gifted** (SEE *Gifted*)

BRIEF SUBJECT INDEX

5033, 5072, 5084, 5111, 5113
Teacher Attitudes & Personality
 4158, 4990, 4991, 4995, 4996, 5001, 5002, 5003, 5005, 5006, 5008, 5009, 5010, 5053
Teacher Training
 4905, 4976, 4994, 4996, 4997, 4998, 4999, 5000, 5001, 5004, 5005, 5007, 5011
Teaching (see also next headings)
 4900, 4955, 4990, 4992, 5007, 5010, 5014, 5022, 5032, 5049, 5078, 5080, 5128
Teaching Aids (see also Programed Instruction)
 3266, 4351, 4958, 5094, 5096, 5102, 5104, 5117
Teaching Method (see also Programed Instruction)
 3949, 4264, 4863, 4941, 4944, 4945, 4951, 4959, 4960, 5073, 5084, 5092, 5093, 5097, 5098, 5100, 5101, 5103, 5105, 5106, 5108, 5109, 5111, 5112, 5113, 5114, 5115, 5116, 5117, 5130
Teaching/Television (SEE Television)
Team Teaching (SEE Teaching Method)
Telepathy (SEE Parapsychology)
Television
 4174, 4315, 4351, 4410, 4420
Television/Educational (SEE Television)
Temperature
 3380, 3385, 3521, 3578, 3642, 3783, 3784, 4241
Temperature Sense (SEE Cutaneous Sense)
Tension (SEE Conflict, Stress, Anxiety)
Territorial Behavior (SEE Instinctive Behavior)
Test & Testing (see also next headings, Projective Technique, specific tests)
 3245, 3253, 3258, 3259, 3365, 3417, 3525, 3938, 3982, 4271, 4290, 4313, 4515, 4539, 4549, 4550, 4566, 4705, 4727, 4762, 4788, 4790, 4909, 4911, 4913, 4918, 4923, 4924, 4925, 4926, 4927, 4929, 4940, 4953, 5057, 5089, 5125, 5126, 5131
Test Anxiety
 3935, 4259, 4878, 4883, 4893, 4896, 4930, 5019
Test/Ability (SEE Test/Aptitude)
Test/Achievement
 4884, 4902, 4912, 4919, 4930, 4931, 4932, 4949, 4955, 4958, 4963, 5032, 5041, 5042, 5075, 5097
Test/Aptitude
 3260, 3967, 4262, 4569, 4684, 4890, 4914, 4916, 4930, 4948, 5018, 5029, 5039, 5049, 5102, 5149
Test/Intelligence
 3646, 3938, 3968, 3969, 4229, 4235, 4247, 4248, 4249, 4250, 4253, 4255, 4257, 4259, 4281, 4528, 4532, 4533, 4539, 4540, 4541, 4560, 4566, 4569, 4784, 4883, 4915, 4916, 4917, 4922, 4923, 4924, 4930, 4931, 4932, 4939, 4940, 5018, 5028, 5029, 5055, 5069, 5071, 5089, 5097
Test/Personality
 3531, 3793, 3984, 3997, 4000, 4043, 4050, 4056, 4058, 4113, 4136, 4158, 4228, 4235, 4238, 4266, 4273, 4279, 4281, 4282, 4283, 4284, 4287, 4288, 4291, 4292, 4293, 4294, 4298, 4416, 4532, 4540, 4546, 4549, 4569, 4577, 4586, 4606, 4713, 4753, 4881, 4900, 4904, 4906, 4915, 4930, 4963, 4971, 4972, 4973, 4974, 4980, 4981, 4986, 4990, 4996, 5002, 5010, 5013, 5016, 5018, 5025, 5030, 5034, 5040, 5064, 5100, 5102, 5120, 5131
Testing Methods
 3260, 3942, 4257, 4301, 4302, 4309, 4517, 4812
Thalamus
 3542, 3586, 3595, 3612
Thematic Apperception Test (SEE Projective Technique)
Theory (see also Learning Theory, Personality Theory, Psychoanalytic Theory, Information Theory, Motivation Theory, Reinforcement Theory)
 3278, 3289, 3338, 3415, 3440, 3503, 3662, 3898, 4017, 4034, 4074, 4092, 4096, 4108, 4125, 4130, 4142, 4331, 4693, 4735, 4869,

5026, 5123
Therapeutic Community (SEE Community, Psychotherapy/Methods in)
Therapeutic Process (see also Empathy)
 4186, 4360, 4362, 4372, 4380, 4381, 4384, 4385, 4386, 4387, 4388, 4389, 4390, 4392, 4393, 4394, 4395, 4396, 4406, 4407, 4414, 4429, 4447, 4516, 4518, 4633, 4660
Therapist
 4156, 4321, 4329, 4360, 4372, 4375, 4377, 4383, 4384, 4385, 4388, 4389, 4390, 4392, 4394, 4395, 4396, 4397, 4412, 4415
Therapy (see also Behavior Therapy, Drug Therapy, Family Therapy, Psychiatry, Psychoanalysis, Psychotherapy, Speech Therapy, Treatment, Schizophrenia/Treatment of, Mental Retardation/Treatment of, Case Report-Treatment, Electroconvulsive Shock Therapy, Treatment/Outpatient, Psychiatric Patient Treatment, Occupational & Physical Therapy)
 4002, 4125, 4376, 4430, 4469, 4601, 4679, 4825, 4828
Thinking (see also Cognition, Logic, Categorical Behavior)
 3460, 3487, 3489, 3490, 3491, 3492, 3493, 3514, 3685, 3963, 4172, 4269, 4490, 4560, 4615, 4646, 4743, 4912, 4916, 4951, 4984, 4997, 5001, 5017, 5069, 5097, 5114, 5164
Thirst (SEE Water & Water Intake, Deprivation, Motivation)
Threat
 3286, 3444, 3682, 4139, 4227
Threshold
 3279, 3284, 3286, 3302, 3317, 3322, 3328, 3336, 3352, 3353, 3368, 3371, 3373, 3648, 3890, 4244, 4720
Time (see also Perception/Time, Reaction Time)
 3316, 3319, 3366, 3465, 3697, 3847, 3941, 4164
Time Estimation
 3295, 3296, 3297, 3685, 3689, 3691
Time Interval Effects (SEE Interval/Time, Interval/Interstimulus)
Token (SEE Reinforcement)
Tone (SEE Sound)
Touch (SEE Cutaneous Sense)
Tracking (SEE Visual Perception)
Training (see also Teacher Training)
 3795, 3901, 3919, 4263, 4809, 4940, 4952, 5129, 5130, 5132, 5136, 5143, 5157, 5169, 5171
Training/Industrial & Military
 4228, 5119, 5128, 5134, 5135, 5139
Training/Psychology
 4313, 4343, 4344, 4346, 4347, 4348, 4349, 4351, 4352, 4353, 4397, 4398, 4535, 4685, 4843, 4855, 4981, 4983, 5099
Training/Teacher (SEE Teacher Training)
Trait (SEE Personality Trait)
Tranquilizer (see also Drug Therapy, Chlorpromazine)
 3663, 3683, 3688, 3715, 3728, 3735, 3737, 3760, 3765, 3766, 4327, 4437, 4439, 4443, 4444, 4447, 4454, 4460, 4462, 4639, 4751
Transfer (see also Generalization, Learning Transfer)
 3445, 3496, 3816, 5166
Transference (SEE Therapeutic Process, Interpersonal Processes)
Transsexualism (SEE Sexual Deviation)
Transvestism (SEE Sexual Deviation)
Trauma (SEE Stress, Emotion)
Treatment (see also Therapy, Schizophrenia/Treatment of, Case Report-Treatment, Mental Retardation/Treatment of)
 3989, 4202, 4209, 4329, 4512, 4564, 4570, 4592, 4758, 4826
Treatment/Outpatient
 4334, 4342, 4456, 4458, 4465, 4618, 4628, 4841, 4857
Trust (SEE Interpersonal Processes, Social Perception)
Tuberculosis (SEE Disease)
Twins (see also Genetics, Family Relations)
 4651, 4669

Ulcer (SEE Illness)
Unconscious (SEE Motivation, Conscious States, Psychoanalytic Theory)
Underachievement (SEE Achievement/Over & Under)
Underdeveloped Countries (SEE Cultures & Countries)
Undergraduates (SEE Student/College)

INTRODUCING THE **APA MONITOR**

A monthly newspaper published by the American Psychological Association to expedite communication among the members of the APA as well as between the Central Office and the membership, to keep readers informed of the events that are shaping psychology today and to encourage reader response to these events. The Washington Report, the former APA newsletter covering Federal government actions pertaining to the behavioral sciences, is now an integral section of the newspaper.

NON-MEMBER ORDER FORM

Please enter my subscription (calendar year basis only) to the *APA Monitor*. Enclosed is my check for \$3.00. All American Psychological Association members receive the Monitor as part of their dues.

PSYCHOLOGY

and the problems of society

"Moreover, there is nothing in the definition of psychology that dedicates our science to the solution of social problems Our obligations as citizens, however, are considerably broader than our obligations as scientists. When psychological issues are raised in this broader context, we cannot evade them by complaining that they are unscientific."

(Quoted from George A. Miller's Presidential Address to the American Psychological Association—Washington, D. C. Sept. 1969)

Invited addresses (22) and symposia (5) presented at the 77th (1969) Annual Convention of the American Psychological Association. The views and opinions expressed by psychologists, philosophers, sociologists, educators, economists, lawyers and government officials, concerning seven major problem areas of today:

- Psychology and the Social Change Process
- Psychology and Urban Problems
- Psychology and the Challenge of Early Learning
- Psychology and the Minority Groups
- Psychology and the Reduction of Violence
- Psychology and Campus Issues
- Psychology and Society's Future

A constructive and dynamic look at a troubled society.

Ed. by: F. F. Korten, S. W. Cook, and J. I. Lacey

Pages: 450

Price: \$6.00

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA, e.g., an issue of the *Journal of Psychology* may include 20 relevant articles; abstracts for 17 of these articles may appear in the May issue of PA, the other 3, in the June issue.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.).—(10) *Journal abstract*.

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., (*Parapsychology*).

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA—*Psychological Abstracts*.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the PA issue noted in order to determine the abstract number for the author and article cited.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title.

5—Place of publication.

6—Publisher's name.

6a—Year of publication.

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol. 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first-named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.

4a—Editor's name.

4b—Editor designation.

4c—Book title.

5—Referral information.

5a—PA—*Psychological Abstracts*.

5b—Volume number.

5c—Issue number.

6—Inclusive pagination for cited chapter.

ABBREVIATIONS

Abbreviations appearing in this issue include along with units of measurement (e.g., in.=inch, wk.=week, hr.=hour, etc.):

AA = Alcoholics Anonymous
 AC = alternating current
 ACTH = adrenocorticotrophic hormone
 AM = ante meridiem
 amp. = ampere
 bpm = beats per minute
 C = centigrade
 ¢ = cents
 CA = chronological age
 cc = cubic centimeter
 CER = conditioned emotional response
 CFF = critical flicker frequency
 CNS = central nervous system
 cps = cycles per second
 CR = conditioned response (or reflex)
 CRF = continuous reinforcement
 CRT = cathode ray tube
 CS = conditioned stimulus
 CVC = consonant-vowel-consonant
 db. = decibel
 DC = direct current
 DL = differential limen
 DNA = deoxyribonucleic acid
 DRL = differential reinforcement of low rates

E = experimenter
 ECS = electroconvulsive shock
 EEG = electroencephalogram (or -graphy)
 EKG = electrocardiogram
 EMG = electromyogram
 ESP = extrasensory perception
 Exp. = experiment

F = Fahrenheit
 ft-c = footcandle
 ft-l. = foot-lambert

g = gravity
 gm. = gram(s)
 GPA = grade-point average
 GSR = galvanic skin response

Hz. = Hertz

ICS = intracranial stimulation
 im = intramuscularly
 ip = intraperitoneally
 IQ(s) = intelligence quotient(s)
 ITI = intertrial interval
 iv = intravenously

kc. = kilocycle
 kg. = kilogram
 kg/m = kilogram per meter
 kHz. = kilo-Hertz

LD = lethal dose
 LSD = lysergic acid diethylamide

m. = meter
 M = mean
 M = mole or molar
 ma. = millampere
 MA = mental age
 MAO = monoaminoxidase
 mL. = millilambert
 mm. = millimeter
 mph = miles per hour
 msec. = millisecond(s)

N = number
 NREM = nonrapid eye movement

O = observer

p = probability
 % = percent

PM = post meridiem
 pps = pulses per second
 PRE = partial reinforcement effect
 PSE = point of subjective equality
 psi = pounds per sq. in.

r = product-moment correlation
 r = roentgen
 REM = rapid eye movement
 rms = root mean square
 RNA = ribonucleic acid
 rpm = revolutions per minute
 RT = reaction time

S = subject
 SEU = subjectively expected utility
 SPL = sound pressure level

TV = television

UCR = unconditioned response
 UCS = unconditioned stimulus
 UHF = ultrahigh frequency

V = volt
 VHF = very high frequency
 vs. = versus

YMCA = Young Men's Christian Association
 YWCA = Young Women's Christian Association

Test abbreviations include:

California E Scale (Ethnocentrism)
 California F Scale (Fascism)
 CMA scale = Children's Manifest Anxiety scale
 CPI = California Psychological Inventory
 CTMM = California Test of Mental Maturity
 EPPS = Edwards Personal Preference Schedule
 MA scale = (Taylor) Manifest Anxiety scale
 MMPI = Minnesota Multiphasic Personality Inventory
 MPI = Maudsley Personality Inventory
 16 PF = Cattell's 16 Personality Factor Questionnaire
 SVIB = Strong Vocational Interest Blank
 TAT = Thematic Apperception Test
 WAIS = Wechsler Adult Intelligence Scale
 WISC = Wechsler Intelligence Scale for Children

Abbreviations used in authors' addresses are:

Assn. = association
 Assoc. = associates
 Co. = company
 Coll. = college
 Corp. = corporation
 Dept. = department
 Div. = division
 Inst. = institute
 Hosp. = hospital
 Lab. = laboratory
 Inc. = incorporated
 U. = university

Ave. = avenue
 Bldg. = building
 Blvd. = boulevard
 Ct. = court
 Dr. = drive
 Ft. = fort
 Mt. = mount
 Pkwy. = parkway
 Pl. = place
 PO = post office
 Rd. = road
 St. = street
 N, S, E, W = North, South, East, West
 U.S. = United States
 USSR = Union of Soviet Socialist Republic

Psychological Abstracts

VOLUME 45

APRIL 1971

NUMBER 4

GENERAL

5175. Zaslavskii, S. Ya. (Inst. of Cybernetics, Kiev, USSR) **Sluchainye reshayushchie sistemy: I.** [Random decision-systems: I.] *Problemy Bioniki*, 1970, No. 3, 30-35.—Examines apparatus which answer questions "arriving from an external medium." Memory and the Operators F and Q constitute the basic components of the apparatus. For a given question, Operator F performs the preliminary selection of information from the memory, while on the basis of the selected information Operator Q constructs the answer.—*I. D. London.*

5176. Guedes, Maria do Carmo. (Pontifica Universidade Católica de São Paulo, Brazil) **Sobre o uso do conceito de emoção na psicologia.** [Investigation of the concept of emotion in psychology.] *Revista de Psicologia Normal e Patológica*, 1968(Jul), Vol. 14(3-4), 164-169.—Delineates discrepancies in the use of nosological terminology in psychology. Reference is made to Wenger's investigation which demonstrated 20 different definitions of the word "emotion." 4 other investigations are reviewed which also suggest widespread discrepancy in the use of psychological terminology. As a means of clarification of psychological nosological terminology, a more scientific (psychophysiological) approach to behavior is suggested.—*B. A. Stanton.*

OBITUARIES

5177. Baker, Robert A. (U. Kentucky) **Contributions to the history of psychology: XIII. Richard Marlon Griffith: 1921-1969.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 317-318.—Presents a brief biographical sketch, emphasizing his work in psychopathology, clinical diagnosis, phenomenological psychology, and research in other areas of psychology.—*M. West.*

HISTORY

5178. Taverna, P. **Le basi della "Daseinanalyse" da Heidegger a Binswanger: I.** [The bases of "daseinanalyse" from Heidegger to Binswanger: I.] *Neuropsychiatria*, 1968(Jan), Vol. 24(1), 37-49.—Focuses on Heidegger's contribution.—*L. L'Abate.*

5179. Taverna, P. **Verso una psicologia fenomenologica.** [Toward a phenomenological psychology.] *Neuropsychiatria*, 1968(Jan), Vol. 24(1), 23-36.—Husserl, Heidegger, and Sartre should be considered as the precursors and founders of phenomenological psychology.—*L. L'Abate.*

PHILOSOPHY

5180. Fleetwood, Arthur H. (U. Michigan) **Cognitive, conative, and affective mental states: A project in philosophical taxonomy.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 797-798.

5181. Kivenko, N. V. **Izomorfizm biologicheskikh struktur i ego rol' v protsessakh vzaimodeistviya.** [Isomorphism of biological structures and its role in the processes of interaction.] *Problemy Bioniki*, 1970, No. 3, 116-120.—Analyzes 1 of the important questions concerning the problem of the structural organization of "material objects"—"the general principle of their formation." "Reflection [in Lenin's sense is viewed] as a process underlying the emergence of isomorphic relations between the structures of reflecting and reflected systems."—*I. D. London.*

5182. Meerloo, J. A. (34 Weedestein, Amsterdam, Netherlands) **The sense of time and history.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Jul), Vol. 72(4), 353-370.—Examines time as a structural concept, unravelling millions of years of genetic adaptation and condensing culture in a variety of symbols. With a variety of known and unknown body rhythms, and a multitude of memory traces, man confronts reality and forms his subjective concept of time, duration, and eternity. Bound to culture, language, and tradition, this occurs in different ways. Sense of time and history is related to biological functions, to the inner time clock, the sense of rhythm, and the speed of neuronic actions. Gradually, it becomes more related to personal and social schedules, and to religious, philosophical, and physical concepts of time and duration. Creative man builds his own time. Homo sapiens is the only creature with a conscious notion of time and death. (19 ref.)—*Journal summary.*

5183. Mounier, Emmanuel. **Personalism.** Notre Dame, Ind.: U. Notre Dame Press, 1952. xxviii, 132 p. \$2.25(paper).

5184. Parin, V. V. **Leninskaya teoriya otrazheniya i sovremennaya fiziologiya.** [Lenin's theory of reflection and contemporary physiology.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(4), 40-49.—Attempts to demonstrate the continuing force of Lenin's "theory of reflection [of an objective reality in man's consciousness]" from Pavlov's time to the present.—*I. D. London.*

5185. Sapozhnikov, R. A. & Tatamikova, G. A. **Informatsiya i preobrazovanie prirody.** [Information and the transformation of nature.] *Problemy Bioniki*, 1970, No. 3, 121-126.—Examines the views of the Russian physicist, N. A. Umov, on the transformation of nature and provides an interpretation of them from the viewpoint of contemporary information theory.—*I. D. London.*

5186. Shastri, Dinesh C. **The unconscious in Indian philosophy.** *Samiksa*, 1968, Vol. 22(1), 33-40.—Though nothing in Indian philosophy may be exactly equated with the Freudian "unconscious" and "preconscious," similar concepts are *adrsta* and *samskara* (or *karmasaya* and *jnanasaya*) meaning action-residue and knowledge-residue, respectively. *Adrsta* is more significant of the unconscious, and *samskara* more the preconscious. *Adrsta* is produced by previous, especially voluntary,

actions, and produces results in the form of events and experiences of pleasure and pain (some in this life and others reserved for the next). Samskāra is produced as subtle impressions of cognitions producing in turn different tendencies, proneness, and especially all recollections, also functioning in dreams, illusions, and hallucinations. Adṛṣṭa and samskāra are discussed within the context of the beliefs of various schools of Indian philosophy.—*T. N. Webster.*

5187. Timakov, V. D. **Teoreticheskoe nasledie V. I. Lenina i meditsinskaya nauka.** [Theoretical heritage of V. I. Lenin and medical science.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970, Vol. 25(4), 31-40.—Discusses the influence of Lenin's views and theories on various physiological and medical issues. Pavlovian theory is held to buttress Lenin's "theory of reflection [of an objective reality in man's consciousness]."—*I. D. London.*

PARAPSYCHOLOGY

5188. Honorton, C. & Carbone, M. (Maimonides Medical Center, Brooklyn, N.Y.) **A preliminary study of feedback-augmented EEG alpha activity and ESP card-guessing performance.** *Journal of the American Society for Psychical Research*, 1971(Jan), Vol. 65(1), 66-74.—Hypothesized that increments in alpha activity after operant training sessions would be associated with increments in ESP scoring level. 10 Ss took part in 10 sessions of EEG feedback training. The S, a digital frequency discriminator, and an audio oscillator made up a closed feedback loop. S's alpha activity activated a 250-Hz tone. Alpha abundance was registered on digital counters. At each session, Ss completed 2 ESP runs (nonfeedback), 2 4-min rest periods, 4 4-min feedback trials, and 2 more ESP runs (feedback). Only 2 Ss showed significant increments in alpha. A significant negative correlation ($p < .05$) was observed between percent of alpha and ESP scores in the nonfeedback condition. Results for the feedback condition were not significant.—*R. A. White.*

THEORY & SYSTEMS

5189. Allen, A. L. & Shannon, A. G. (U. Papua & New Guinea) **Note on a category model for an abstraction mechanism.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 591-594.—Presents a mathematical scheme which clarifies the mechanism of abstraction. A list of elementary mathematical terms is included. The main result is the proof of the existence of a free universal abstraction of a given set of ideas.—*Journal abstract.*

5190. Crovitz, Herbert F. (Duke U.) **Galton's walk: Methods for the analysis of thinking, intelligence, and creativity.** New York, N.Y.: Harper & Row, 1970. xii, 159 p. \$2.95(paper).

5191. Duijker, H. C. (U. Amsterdam, Psychological Lab., Netherlands) **Some introductory remarks on the concept of behaviour.** *Psychiatry, Neurologia, Neurochirurgia*, 1969(Sep), Vol. 72(5), 439-445.—The notion of behavior is generally used in the definition of modern psychology. The meaning of behavior, and the scope of psychology are examined. It is argued that if behavior is defined as the set of observable, or measurable, processes in an organism, such a definition is not suitable to indicate the field of any particular science. On the contrary, such distinctions must be based on empirical

data concerning not behavior itself, but its determinants.—*Journal summary.*

5192. Rapoport, Anatol. (U. Michigan, Mental Health Research Inst.) **The impact of cybernetics ideas on psychology.** *Kybernetika*, 1969, Vol. 5(5), 363-377.—Discusses the impact of cybernetic ideas in psychology in the area of the mind-body problem, on theories of the nervous system, and on social-ethical problems arising as consequences of automated technology.—*Journal abstract.*

5193. Reynolds, Janice M. (Ohio State U.) **A comparative analysis of behavioristic and transformational paradigms.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 839.

5194. Rosenbluth, Arturo. **Mind and brain: A philosophy of science.** Cambridge, Mass.: Massachusetts Inst. of Technology Press, 1970. xii, 128 p. \$5.95.

5195. Swartz, Paul. (U. Alberta, Edmonton, Canada) **A rose for behaviorism.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 364.—Cites quotations from writing by Marcel Proust in 1920 and 1925 illustrating the reinforcing effect of anxiety reduction. It is suggested that literary artists can, in this way, make contributions to the science of psychology.—*P. McMillan.*

EDUCATION & TRAINING

5196. Gregson, R. A. (U. Canterbury, Christchurch, New Zealand) **Problems of teaching the mathematical foundations of psychology.** *International Journal of Psychology*, 1969, Vol. 4(3), 239-246.—*S. E. Gavin.*

5197. Knox, Wilma J. (Veterans Administration Center, Biloxi, Miss.) **Obtaining a PhD in psychology.** *American Psychologist*, 1970(Nov), Vol. 25(11), 1026-1032.—Analyzed demographic characteristics of psychology graduate students entering 4 universities between 1955 and 1964 in relation to completion of the PhD or withdrawal. Of 593 Ss studied, 27.7% completed the PhD, 27.3% remained in school, and 45% withdrew. Mean time to completion was 3.77 yr. for Ss entering with a masters, and 5.07 yr. for those entering without one. Marital status and sex were significantly related to obtaining the PhD but not to time for degree completion. Age at entrance, graduate major, undergraduate major, and type of degree showed no relation to completion or withdrawal. Other related factors including the problem of dropouts are discussed. (17 ref.)—*Author abstract.*

5198. Lunneborg, Patricia W. (U. Washington) **Undergraduate psychology field work: The unwashed take over.** *American Psychologist*, 1970(Nov), Vol. 25(11), 1062-1064.—Describes a field work course which gives undergraduates the opportunity to participate in over 40 community agencies in the application of psychological theory and knowledge to society's problems. The primary purpose of the practicum is personal growth in the area of psychology within which the student plans to make a career or continue graduate studies.—*Author abstract.*

5199. Mansilla Trespalacios, Adolfo. **Prueba de intereses específicos para psicología.** [Test of specific interests for psychology.] *Revisita de Psicología*, 1968, Vol. 13(1-2), 17-40.—Describes an investigation of aptitude and interest to evaluate candidates best suited for the study of psychology. The 121-item test was administered to 48 psychology students, 68 architecture students, 28 sociology students, 62 medical students, and 56 engineering students. Areas of investigation included

(a) the nervous and endocrine systems, (b) psychological terminology, (c) psychology as a profession, and (d) the psychological evaluation of literary characters. Significant differences were found between the aptitudes and interests of psychology students and all other Ss except medical students. The test is recommended as a valid evaluation technique for aspiring psychologists. (27 ref.)—*P. Hertzberg.*

5200. Marques, Juracy C. (Pontifica Universidade Católica do Rio Grande do Sul, Porto Alegre, Brazil) **O ensino da psicologia como crescimento de grupo.** [Psychological training as group growth.] *Revista de Psicologia Normal e Patológica*, 1968(Jul), Vol. 14(3-4), 186-198.—Described the use of groups to provide training for psychology students. A group of 57 female, middle-class, psychology students (ages 16-32) was divided into an experimental group of 25 Ss who conducted discussions concerning the dynamics of behavior, and a control group of 32 Ss who conducted discussions concerning personality development (intellectual, emotional, and social), and wrote papers describing individual experiences with the group. Results confirmed the hypothesis that individuals in both groups would experience personal growth, however, Ss in the experimental group evidenced considerably greater resistance to participation than did Ss in the control group. The use of discussion groups in the training of psychologists was advocated as a means of promoting personality growth. (Portuguese summary)—*B. A. Stanton.*

5201. Morgenstern, Alan L. (U. Oregon, Medical School) **A criticism of psychiatry's Board examinations.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 33-42.—Argues that the testing system and actual physical make-up of psychiatry's Board examinations have been static since its origination, and that too many qualified people have been barred because of its archaic state. The relevance of having neurology and psychiatry linked for this testing process is questioned as is the length of the written examination (100 questions/hr) which could unjustly penalize the slow reader. It is suggested that the validity of the preparation, feedback system, and the oral examination need to be reevaluated in light of new educational premises. A discussion by D. A. Boyd follows. (36 ref.)—*P. R. Shibleski.*

5202. Tanco Duque, Rosa. (National U., Bogotá, Colombia) **Sobre un plan de estudios para la carrera de psicología.** [A curriculum for the psychology career.] *Revista de Psicología*, 1967, Vol. 12(1-2), 105-109.—Describes a proposed 5-yr program leading to the title of "psychologist," to be offered at the Psychology Department of the National University of Colombia. —*L. Zusne.*

PROFESSIONAL DEVELOPMENTS

5203. Gregory, Ian. (Ohio State U., Medical School) **Elimination of an internship requirement for medical licensure and board certification in psychiatry.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1557-1564.—Reports the results of 2 nationwide surveys conducted in relation to the American Board of Psychiatry and Neurology's recent decision to eliminate the internship requirement as a condition of eligibility for the Board examination. Results indicate a generally favorable attitude towards this decision, stating that, in this age of specialization, the field of psychiatry is always

expanding, and that the requirement for an internship in other fields of medicine prior to residency is unnecessary and a hindrance. The 2 surveys taken in the summer of 1969 were addressed to the corresponding officers of 40 state boards of medical examiners (100% response rate) and the chairmen of departments of psychiatry in 95 4-yr medical schools (90% response rate). The departments most reluctant to accept 1st-yr residents without prior internship tended to be (a) located in close proximity to affiliate societies of the American Psychoanalytic Association, (b) those not currently offering a rotating internship with emphasis on psychiatry, (c) those whose chairmen were born prior to 1916, and (d) those whose chairman's residency training was in close proximity to an affiliate society of the American Psychoanalytic Association.—*P. R. Shibleski.*

5204. Hicks, Leslie H., Leibowitz, Herschel W., Ross, Sherman, & Paller, Marsha. (American Psychological Association, Washington, D.C.) **A 1970 overview of sources of support for psychological research.** *American Psychologist*, 1970(Nov), Vol. 25(11), 1013-1025.—Provides information on funding sources for research activities. Grant and contract programs sponsored by various federal agencies are described, including those of the National Science Foundation, various branches of Health, Education and Welfare (the National Institute of Mental Health, the National Institute of Child Health and Human Development, the Office of Education, and the Social and Rehabilitation Service), and the Departments of Labor, Transportation, Defense, State, Justice, Housing and Urban Development, and the National Aeronautics and Space Program. Programs of 31 private foundations are also listed, including the foundation name and address, and the purposes and activities of the respective support programs.—*P. McMillan.*

5205. Miller, George A. (Rockefeller U., New York, N.Y.) **Assessment of psychotechnology.** *American Psychologist*, 1970(Nov), Vol. 25(11), 991-1001.—Discusses the importance for the field of psychology of assessing the costs and benefits of new technologies before they are introduced to society on a large scale. Examples are cited (i.e., the polygraph and personality testing) of instances of public concern over invasion of privacy by such psychotechnology. A code of priorities for assessing psychotechnology is suggested as a supplement to the present American Psychological Association code of ethics. Such a code would require compliance with the following criteria: validity, intelligibility, reliability, social relevance, safety, accountability, obtaining informed consent, avoidance of deception, emphasis on individuality, availability, and distributability (assessable to all rather than to a privileged subgroup). (17 ref.)—*P. McMillan.*

5206. Myers, C. Roger. (U. Toronto, Ontario, Canada) **Journal citations and scientific eminence in contemporary psychology.** *American Psychologist*, 1970(Nov), Vol. 25(11), 1041-1048.—Investigated the validity and reliability of publication citations as a measure of scientific eminence in psychology. Citations from 14 representative English language journals, published from 1962-1967, were examined. Results were compared with other indices of eminence, i.e., being listed in *American Men of Science*, receiving scientific contribution awards, election to presidency of the American Psychological Association, etc. Results suggest that journal citation provides an index that is correlated

with other measures of eminence. Difficulties from high journal citation and low eminence and the reverse of this are discussed. (30 ref.)—P. McMillan.

5207. Romano, John. (U. Rochester, Medical & Dental School) **The elimination of the internship: An act of regression.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1565-1576.—Argues that the elimination of the internship requirement "will seriously limit the future psychiatrist's unique contributions to his own field as well as to other areas of medical practice. Building upon this major thesis a rebuttal to I. Gregory's (see PA, Vol. 45:Issue 4) article is presented. Informative data are presented to support the contentions. (24 ref.)—P. R. Shibelski.

INTERNATIONAL PSYCHOLOGY

5208. Mankelinas, Mateo V. (National U., Bogotá, Columbia) **Psicólogo y sociedad.** [The psychologist and society.] *Revista de Psicología*, 1967, Vol. 12(1-2), 5-11.—On the occasion of the 20th anniversary of the Department of Psychology of the National University of Colombia, the history of the rise of psychology as a profession is reviewed, as well as the existing attitudes of the society toward psychology, and the psychologist's responsibilities to society.—L. Zusne.

GENERAL BOOKS & REFERENCE WORKS

METHODOLOGY & RESEARCH TECHNOLOGY

5209. Lambley, Peter. (U. Cape Town, South Africa) **Authoritarian trends in contemporary psychology: The dominance of the paradigm.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 575-582.—Attempts to show how the concept of authoritarianism can be applied, in a metatheoretical sense, to the activities of paradigms found in modern psychology. The argument is advanced that current paradigm-languages tend to obscure important epistemological issues and create an aura of authority that serves to curtail too self-critical thinking. (46 ref.)—*Journal abstract.*

5210. Sonne, John C. (Hahnemann Medical Coll., Philadelphia, Pa.) **Research as a rebellion.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 47-51.—"Really worthwhile research will only be done in the spirit of rebellion" by a person who is not satisfied with his present world. It is believed that society should think what it will of new ideas, test them, but should not control output. Insofar as society is resistant to new ideas, the researcher will be the rebel against this resistance. W. A. Phillips, who discusses this article, indicates he would prefer to defend the notion that research is narcissism, competition, and a game, rather than rebellion.—S. R. Greenwald.

MODELS & MATHEMATICAL MODELS

5211. Belyakov, R. V. **Rol' struktury v sistemakh modelirovaniya ritmicheskikh protsessov.** [Role of structure in systems for modeling rhythmic processes.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 134-138.—Examines the role of structure in systems which simulate rhythmic processes, and describes new

possibilities in modeling rhythmic lability.—I. D. London.

5212. Bratko, A. A. **Modelirovanie psikhiki kak évrísticheskaya problema.** [Modeling of the psyche as a heuristic problem.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 15-24.—Examines the possibility of classifying the models of psychic activity on the basis of completeness of reflection of the properties of the modeled object in the model.—I. D. London.

5213. Fischer, Gerhard H. (U. Vienna, Inst. of Psychology, Austria) **Datenmodelle und Parametermodelle.** [Data models and parameter models.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(2), 212-219.—Discusses 3 approaches to measurement based on: (a) preestablished rules, (b) deterministic data models, and (c) probabilistic parameter models. The last approach is the most promising since it leads to concept formation and theory building. As an example, the application of Rasch's logistic measurement model on Rorschach and Holtzman tests is given. (French & English summaries) (18 ref.)—W. J. Koppitz.

5214. Fridman, L. M. (Inst. of General & Educational Psychology, Moscow, USSR) **O putyakh razvitiya matematicheskoi psikhologii.** [On the ways of the development of mathematical psychology.] *Voprosy Psikhologii*, 1970(Jul), Vol. 16(4), 13-24.—Mathematical psychology is a branch of psychology in which psychological phenomena processes, and states are investigated by means of special mathematical models. It should not include all applications of mathematics in psychology, such as statistics and psychometrics. Its special object of investigation is not psychological phenomena but models of these phenomena. The characteristics of mathematical models are discussed and different classifications of models are presented. Differences between mathematical and other types of models are examined using Hull's work. The question concerning the kinds of psychological phenomena that mathematical psychology can be applied to cannot be answered yet. It must, however, be recognized as a special field of psychology. (English summary) (51 ref.)—L. Zusne.

5215. Nazarov, A. L. (Moscow State U., USSR) **Opyt éksperimental'nogo issledovaniya vzaimozavisimyykh protsessov.** [An experimental study of interdependent processes.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 37-50.—Presents a description and the results of a study on the control of mutually dependent processes, where in exteriorization of the processes is effectuated through the construction of an electrical model whose state is created by 2 interdependent functions regulated by 1 or more human operators. The findings contribute to an understanding of "coordinated control."—I. D. London.

5216. Shabanov-Kushnarenko, Yu. P. **Ob algoritma, lezhashchem v osnove inertsi i irradiatsii chelovecheskogo zreniya.** [On the algorithm lying at the basis of inertia and irradiation in human vision.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 195-201.—Analyzes a psychophysical model of human vision, possessing properties which correspond to inertia and irradiation.—I. D. London.

5217. Shabanov-Kushnarenko, Yu. P., Shul'gin, I. V., & Lopatchenko, B. K. **O matematicheskom modelirovanii uznvaniya.** [On the mathematical modeling of recognition.] *Problemy Bioniki*, 1970, No. 3, 149-152.—Analyzes recognition, from the viewpoint of the cybernetic "black box," as a process of transforming information, at whose basis lie certain algorithms. A

theorem is developed which reduces the task of searching for a common form of recognition-operator, "responding to an experimental law," to the simpler task of finding at least 1 partial form of the operator, "satisfying this law."—*I. D. London.*

5218. Starinets, V. S. **K voprosu o modelirovani lichnosti.** [On the modeling of personality.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 91-107.—Analyzes the basic stages for the construction of a global model of personality on the basis of a generalization of an earlier model for speech behavior, developed by the author.—*I. D. London.*

5219. Tversky, Amos & Krantz, David H. (Hebrew U., Jerusalem, Israel) **The dimensional representation and the metric structure of similarity data.** *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 572-596.—Demonstrates that a set of ordinal assumptions, formulated in terms of a given multidimensional stimulus set, yields essentially unique additive difference measurement of dissimilarity, or psychological distance. According to this model, dissimilarity judgments between multidimensional objects are regarded as composed of 2 independent processes; an intradimensional subtractive process, and an interdimensional additive process. Although the additive difference measurement model generalizes traditional metric models, the conditions under which it satisfies the metric axioms impose severe restrictions on the measurement scales. (15 ref.)—*Journal abstract.*

MATHEMATICS & STATISTICS

5220. Adams, Ernest W., Fagot, Robert F., & Robinson, Richard E. (U. California, Berkeley) **On the empirical status of axioms in theories of fundamental measurement.** *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 379-409.—Questions precisely what the empirical content is of axioms in theories of fundamental measurement. The basic concept in terms of which formal results are stated is that of data equivalence between 2 theories. 2 theories are data equivalent only if they are consistent with exactly the same finite sets of basic "observation" statements. The significance of data equivalence is that if 2 theories are data equivalent and their primitive notions are given the same interpretation, then no experimental test can refute 1 without refuting the other. Certain axioms (Archimedean and continuity conditions) are purely "technical" in the sense that the theory with the axiom in question is data equivalent to the theory without the axiom, whereas certain other axioms, previously treated as technical, are indirectly testable; i.e., have testable consequences when considered in combination with other directly testable axioms. The concept of data equivalence is used to analyze the R. D. Luce and J. Tukey axioms for conjoint measurement, axiom systems for interval measurement, for additive and bisection measurement, and for extensive measurement.—*Journal abstract.*

5221. Akins, Karen M. (U. Oklahoma) **On robustness of the F-test for correlated observations.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 541.

5222. Béjar Alamo, Juan. **Programación no lineal: Comparación de diversos métodos.** [Nonlinear programming: Comparison of various methods.] *Trabajos de Estadística y de Investigación Operativa*, 1969, Vol. 20(1),

17-34.—Presents various theories on the general problem of nonlinear programming: finding the maximum of function (x_1, \dots, x_n) of n variables when subjected to various restrictions represented by $g_i(x_1, \dots, x_n) \leq 0$; and $i = 1, 2, \dots, m$. Theories discussed include those of (a) Kuhn and Tucker; (b) Rosen (on gradient projection); (c) Zoutendijk and Kelley (on convex programming); (d) Carroll (on the created response surface technique for optimizing nonlinear restrained systems); and (e) Fracco and McCormick (on the slacked unconstrained minimization technique for convex programming).—*P. Hertzberg.*

5223. Boruch, Robert F. & Wolins, Leroy. **A procedure for estimation of trait, method, and error variance attributable to a measure.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 547-574.—Formulates a model requiring a restricted likelihood factor analysis. It states that an observation Y is composed of factorially weighted general, trait, method, and error scores. Weights, errors, and intercorrelations between factors, it is presumed, are derived from a multitrait-multimethod design. A goodness of fit test suitable to the model is described. Multiple interpretations of significant chi-squares are presented. 2 illustrative examples are given.—*N. M. Chansky.*

5224. Burke, C. J. (California State Coll., Hayward) **Density and length.** *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 466-477.—Provides an axiomatization of the density dimension together with a parallel axiomatization of length, which is completely equivalent to the classical 1. The strategy is to weaken the traditional identity and associativity axioms for length, respectively, to the solvability and interchange axioms presented—weaker axioms true for density as well as length. From an empiricist view, the crucial axioms are intermediacy (the density of a composition is intermediate between those of the components) for density, and extension (the length of a composition is no smaller than that of either component) for length. From a rationalist view, the crucial axioms are intermediacy for density and the Archimedean property for length. From either view, every axiom of either dimension is also true in the other, except the crucial ones.—*Journal abstract.*

5225. Campos, Leonel. (U. Manila, Philippines) **The measurement of consensus in pair-comparison studies.** *Philippine Journal of Psychology*, 1969(Jun), Vol. 2(1), 34-38.—Suggests that M. G. Kendall's coefficient of agreement, u , is not an appropriate measure of consensus in pair-comparison studies. A new index of consensus, $M(c)$, is described. It is further suggested that Kendall's own adaptation of the X^2 may be used, with minor modifications, to test the significance of a departure of $M(c)$ from a value of 0.—*Journal abstract.*

5226. Campos, Leonel & Santos, Josefina. (U. Manila, Philippines) **Mann-Whitney's U as an indicator of relationship.** *Philippine Journal of Psychology*, 1969(Jun), Vol. 2(1), 31-33.—Suggests that Mann-Whitney's U can be used to derive a measure of relationship, r_u , which is the rank-analogue of the product-moment point biserial, r_{pb} . It is further suggested that Mann-Whitney's U itself can be used to evaluate the significance of r_u . An empirical comparison between r_u and r_{pb} yields $r = .875$ suggesting a basic similarity in their behavior. This fact is interpreted to indicate that r_u is an adequate substitute for r_{pb} in situations where the latter does not apply.—*Journal abstract.*

5227. Carillo, Alfonso F. (Iowa State U.) **Estimation**

of variance after preliminary tests of significance. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 950.

5228. Carroll, Robert M. (Ohio State U.) A Monte Carlo comparison of nonmetric multidimensional scaling and factor analysis. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 896.

5229. Coles, Gary J. (U. North Dakota) Methodological note: An application of three-way analysis of variance in the estimation of inter-judge reliability. *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 569-570.—Describes an application of 3-way analysis of variance to the estimation of interjudge reliability in a psychological scaling investigation as suggested by R. L. Ebel (see PA, Vol. 27:771).—*Journal abstract*.

5230. Crott, Helmut W. (U. Mannheim, Inst. of Psychology, W. Germany) Simultaneous conjoint measurement: Ein Verfahren zur gleichzeitigen fundamentalen Messung mehrerer Dimensionen. [Simultaneous conjoint measurement: A procedure for the simultaneous fundamental measurement of several dimensions.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(2), 220-233.—Discusses Luce and Tuckey's simultaneous conjoint measurement and its application by Tversky with regard to other fundamental measurement systems and multidimensional scaling methods. (English & French summaries) (22 ref.)—W. J. Koppitz.

5231. Data, S. An empirical study on the comparison of different methods of obtaining single-trial reliability estimates. *Journal of Psychological Researches*, 1969, Vol. 13(2), 67-70.—Odd-even, split-half, Guttman's "L4," and the Raju-Guttman formula all yielded the same reliability coefficients, while the Kuder-Richardson Formula 20 and the Saupe Formula R-20 yielded fairly good estimates near to the above 3 formulas. Of all the 7 methods, the Saupe Formula R-20 yielded the highest reliability coefficients and is judged the best.—U. Pareek.

5232. Elashoff, Janet D. (Stanford U., School of Education) Analysis of covariance: A delicate instrument. *American Educational Research Journal*, 1969(May), Vol. 6(3), 383-401.—Reviews the advantages and limitations of the analysis of covariance focusing on the assumption the data must satisfy if analysis of covariance is to be a valid technique. A description of the effects of unsatisfied assumptions on the covariance procedure and suggestions for checking the validity of the required assumptions are presented. Covariance analysis is compared to adjustments based on between-groups regression and designs incorporating matching or blocking. (32 ref.)—*Journal abstract*.

5233. Glass, Gene V. & Hakstian, A. Ralph. (U. Colorado) Measures of associates in comparative experiments: Their development and interpretation. *American Educational Research Journal*, 1969(May), Vol. 6(3), 403-414.—Difficulties with the use of such measures of association as T. L. Kelley's ϵ^2 and W. L. Hays's ω^2 stem from the conceptual complexity of categorical independent variables. By adding a single level to such molar variables as method of instruction, the value of ϵ^2 or ω^2 can change radically, misleading the researcher. Even when a variable is molecular, use of ϵ^2 or ω^2 in the fixed-effects model is questionable; a measure of association between 2 variables is interpretable only when levels of both are randomly representative. With a fixed-effects model, depending on the nature of the fixed

independent variable, the researcher should use graphical analyses or such inferential techniques as multiple comparisons and trend analysis.—*Journal abstract*.

5234. Gregson, R. A. (U. Canterbury, New Zealand) Quadratic similarities. *British Journal of Mathematical & Statistical Psychology*, 1970(May), Vol. 23(1), 53-68.—Presents an axiom set for similarities together with a set-theoretic definition of multidimensional similarity consistent with the axioms. A special case of relative similarity judgment, involving the simultaneous comparison of 3 stimulus pairs, called quadratic similarities, is empirically illustrated and related to the theory. The goodness of fit of the axiomatic theory is checked for both unweighted and differentially weighted versions. Agreement generally varies between Ss, but in some cases is very good, and is almost invariably improved slightly by weighting. (30 ref.)—*Journal abstract*.

5235. Hsu, Tse-Chi & Feldt, Leonard S. (U. Pittsburgh, Learning Research & Development Center) The effect of limitations on the number of criterion score values on the significance level of the F-test. *American Educational Research Journal*, 1969(Nov), Vol. 6(4), 515-527.—Determined whether data arising from scales which yield a severely limited number of score values can be validly analyzed via F-tests. Score scales ranging from 5-2 points were studied. For each scale length, 3 populations of scores were created. Repeated samples of scores were drawn via computer from 1 or a combination of the populations. A completely randomized analysis of variance was carried out ($N = 11$ or 51 and $k = 2$ or 4) on each set of samples. The resultant empirical distributions of mean square ratios were compared to the appropriate F-distributions. The F-test was found to be quite robust with respect to limitations in the score scale.—*Journal abstract*.

5237. Kristof, Walter. (Educational Testing Service, Princeton, N.J.) A theorem on the trace of certain matrix products and some applications. *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 515-530.—Establishes a theorem giving attainable upper and lower limits for the trace of certain products of real matrices. These products are of the form $X_1\Gamma_1X_2\Gamma_2\ldots X_n\Gamma_n$ with orthogonal matrices X_i and diagonal matrices Γ_i where the matrices X_i are allowed to vary independently and unrestrictedly. The proof makes use of 2 lemmas. The theorem may find application in psychometrics when the trace of matrices is involved. (22 ref.)—*Journal abstract*.

5238. Levine, Michael V. (U. Pennsylvania) Transformations that render curves parallel. *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 410-443.—Presents 5 examples to indicate the desirability of having a general theory treating sets of curves that can be transformed into parallel curves. It is shown that a set of curves can be rendered parallel only if every pair of functions in the completion of a particular group associated with the curves is uncrossed. Under general conditions any 2 transformations rendering a set of curves parallel are related by a linear transformation. Methods for calculating transformations are proposed. Several structural properties of sets of curves which can be rendered parallel are proven. (24 ref.)—*Journal abstract*.

5241. Natapoff, Alan. (Massachusetts Inst. of Technology, Space Research Center) **How symmetry restricts symmetric choice.** *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 444-465.—In a symmetric choice experiment, the share of response found on the i th alternative, or state, S_i , is proportional to $F(S_i)$, a weight function that describes the results. The form of f is restricted by the symmetries of the experimental situation through a functional equation. The response distribution must obey that equation and the extraction of a satisfactory theoretical expression for it is analogous to the standard procedures used with differential equations to analyze mechanical systems. It is shown that every symmetric choice function, f , is equivalent to a simpler, normal function, the product of whose separate values is unity. This can simplify the discovery of simple formulas underlying otherwise obscure numerical results. Applications are given to behavioral problems. Applicability to symmetric neural channels, e.g., paired optic or auditory nerves is noted.—*Journal abstract*.

5242. Roskam, E. E. (Catholic U., Nijmegen, Netherlands) **The method of triads for nonmetric multidimensional scaling.** *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Jun), Vol. 25(6), 404-417.—The method of triads is used to obtain data on the rank-order of similarities among stimuli by counting the frequency by which one pair is judged more similar than another. The true-rank order by this method is difficult to obtain as this technique produces only a subset of all pairs of pairs. Triadic data can be used to obtain a conditional similarity matrix provided no violations of transitivity occurred in the data collection. Possibly a generalization of J. B. Kruskal's and L. Guttman's methods for nonmetric scaling can accommodate intransitives. This generalization consists of applying the procedures for obtaining monotone values to each ordered subset in the data independently and then deriving the averages of these values. 4 methods of data-collecting and analyses were studied: rated data, ranked data, vote-counting, and triadic data. It is tentatively concluded that vote counting is most deficient; either rated data or ranked data can be used when little error is present; and triadic data is considered the most valid method.—*A. J. Ter Keurst*.

Post Coll., Long Island U.) **Strength of statistical association for two-group independent sample experiments.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 595-598.—Presents a table giving values of ω^2 (strength of statistical association) for the independent sample t test. The use of this table will enable the researcher to report the percentage of variance in the dependent variable accounted for by the independent variable. Judgments of the import of experimental results are more appropriately based on the magnitude of ω^2 than on level of significance, t , or sample size.—*Journal abstract*.

5244. Saunders, D. R. (U. Colorado) **On the statis-**

tical treatment of remarkable data. *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 533-545.—Introduces "remarkability" as a quantifiable attribute of given data, on the basis of which the scientific value of data may be rationally judged. "Remarkability is measured in bits of information, and is computed from the relation of an observed to an expected probability, according to an equation." R is applicable to studies of hypothesis testing, factor analysis, item analysis, and multiple regression analysis.—*N. M. Chansky*.

5245. Speight, L. R. (Army Personnel Research Establishment, West Byfleet, England) **Serial dependency in the method of limits.** *British Journal of Mathematical & Statistical Psychology*, 1970(May), Vol. 23(1), 73-86.—Presents a simple Markov model of response dependency in psychophysical experiments. The constant method is briefly reviewed in the light of this model, and is shown to result in unbiased estimates of the psychophysical function. The method of limits is examined in more detail. Estimates of psychophysical function parameters obtained by this method, whether by averaging stopping-point values or by conducting a probit analysis on the derived data, are shown to be a function of the interstimulus interval chosen, the stopping criterion selected, and the degree of response dependency. However, bias is very small when stopping-point averages are employed, provided that the interstimulus interval is fairly large compared with the slope of the psychophysical function, and that use is made of a simple correction formula.—*Journal abstract*.

Factor Analysis

5249. Cattell, Raymond B. (U. Illinois) **The isopodic and equipotent principles for comparing factor scores across different populations.** *British Journal of Mathematical & Statistical Psychology*, 1970(May), Vol. 23(1), 23-41.—Describes within the ordinary factor analytic procedures, an equipotent method which throws scores from different groups into a combined standard score distribution, and operates on the scores of each group with its own factor estimation weights, but with the matrices for all the groups brought to equipotency. A more satisfactory isopodic procedure is also proposed, using covariance factoring, after 1st reducing artificial metric differences among variables by universe standardizing conversions. A more radical attainment of the isopodic goal is reached if the mean standardized covariance matrix is applied to the raw score deviations of members of all groups, brought into a combined distribution on each variable. (34 ref.)—*Journal abstract*.

5250. Clarke, M. R. (U. London, Inst. of Computer Science, England) **A rapidly convergent method for maximum-likelihood factor analysis.** *British Journal of Mathematical & Statistical Psychology*, 1970(May), Vol. 23(1), 43-52.—Gives a method of finding 2nd derivatives of the likelihood function and shows how they lead to a simple and rapidly convergent numerical method for the estimation of factor model parameters. These enable a Newton-Raphson method to be used for maximum-likelihood estimation in factor analysis. A useful feature of the method is an asymptotically correct expression for the sampling variances of the estimated parameters.—*Journal abstract.*

D. London.*

TESTING

5270. Cappon, Daniel & Banks, Robln. (York U., Toronto, Ontario, Canada) "The birth of a test": The Sensory Quotient. *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 408-410.—A multimodal pattern-discrimination test has been used to differentiate sections of a general urban population: occupational groups within an industry, academic groups within a school, and persons attending performing arts. The differentiation is in terms of sensory competence based on performance on 4 sensory modalities, yielding both individual and group sensory profiles as well as an over-all score—the Sensory Quotient.—*Journal abstract.*

5271. Mednick, Martha T. & Silber, David E. (Howard U.) Comparison of two administration times for the Remote Associates Test: An attempt at partial replication. *Psychological Reports*, 1970(Oct), Vol. 27(2), 474.—In a partial replication of a study by M. T. Mednick and S. K. Halpern (see PA, Vol. 43:15002), 210 undergraduates were tested on the Remote Associates Test to determine if the time of test administration was related to performance. Ss' scores at the end of 15 and 40 min. of a single administration of the test were correlated with each other. For a portion of Ss, scores were also available on the Scholastic Aptitude Test (SAT) and the Vocabulary Test of the General Aptitude Test Battery (GATB-V). Results show substantial correlation between the scores on the RAT but extremely low correlations with the SAT and GATB-V. The latter result was not in agreement with earlier findings that the RAT correlated with intelligence measures.—*P. McMillan.*

5272. Rippey, Robert M. (U. Chicago) Rationale for confidence-scored multiple-choice tests. *Psychological Reports*, 1970(Aug), Vol. 27(1), 91-98.—Proposes a system for responding to and scoring multiple-choice tests in which students express their distribution of preference for options as well as their certainty in that distribution. Such a system of scoring allows the use of types of test items which have previously been ignored. (18 ref.)—*Journal abstract.*

5273. Sciortino, Rio. (Stevens Inst. of Technology) Solutions Attribute List: I. Factor structure for solutions of a task administered under neutral test-taking instructions. *Psychological Reports*, 1970(Oct), Vol. 27(2), 435-438.—Used the Solutions

Attribute List (SAL-1) to score 2440 responses given by 173 male and female undergraduates on a task from the Solutions Test. The task was administered under neutral test-taking instructions and in a test format having 3 parts, preparation, production, and revision. A principal components analysis was performed on the matrix of item correlations (SAL-1 items), with unities in the diagonal. When the matrix of principal components was rotated according to the varimax procedure, 3 factors were obtained: projects, acceptability, and specificity.—*Journal abstract.*

5274. Silverstein, A. B. & Fisher, Gary. (California Dept. of Mental Hygiene, Pacific State Hosp., Pomona) Test adequacy as a function of item structuring and substantive homogeneity. *Psychological Reports*, 1970(Aug), Vol. 27(1), 137-138.—Provides further support for 2 of D. W. Fiske's (see PA, Vol. 40:8255) hypotheses: the adequacy of a test is a direct function of the structuring of the items and their substantive homogeneity. The Stimulus Situation-Response Inventory of Anxiousness was administered to Ss as a part of a larger test battery within 1 mo. of 100 18-59 yr. old male prisoners' arrival at the Southern California Reception-Guidance Center of the Department of Corrections. Generally, the observed values are consistent with the pattern reported previously.—*Journal abstract.*

5275. Stanley, Julian. (Johns Hopkins U., Center for Social Organization of Schools) Definition of true score appropriate for estimated true scores. *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 525-531.—Relevant true scores vary with obtained scores. To satisfy classical test theory, errors of measurement sum to zero and true scores correlate zero with error scores. Thus, both the obtained score and the estimated true score found by linearly transforming the obtained score meet these requirements. Standard errors appropriate to obtained scores are presented and discussed. Distinction is made between a group variation about an array mean designated by the standard error of estimate and an individual's variation about his true score designated by the standard error of measurement. Inappropriate models for measurement errors are also discussed.—*N. M. Chansky.*

Construction & Validation

5276. Schubert, Josef. (U. Saskatchewan, Regina, Canada) The VRB apparatus: A cross-validation. *Psychological Reports*, 1970(Oct), Vol. 27(2), 571-574.—Reports cross-validation data for a test investigating the verbal regulation of behavior (VRB) as previously described by J. Schubert (see PA, Vol. 43:17165). Initial results were confirmed with a sample of 168 2-15 yr. old clinical Ss. VRB scores were significantly related to age and intelligence ($p < .001$). Split-half reliability of the final test battery was .92 ($N = 100$) and the correlation between VRB scores and MA was .79 ($N = 84$).—*Journal abstract.*

5277. Thorpe, Joanne & West, Charlotte. (Southern Illinois U.) Reliability of a test of game sense. *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 582.—Administered equivalent forms to 57 undergraduates on 2 days of testing. Pearson r 's for the 10 subtests ranged from .43-.75. The r for the total test suggested for use on a single day was .89, indicating a stable estimate.—*Author abstract.*

EXPERIMENTATION & OBSERVATION

5278. Brandt, Lewis W. (U. Saskatchewan, Regina, Canada) **Control or reduction of variables? An experimenter inclusive model.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 80-82.—Proposes a communication flow chart representing the experimental situation. Codings by E and S are discussed as uncontrollable intrapersonal variables whose number may be reduced by E serving as S. It is suggested that the designer of an experiment weigh the possible gain from the reduction of the number of uncontrollable variables against the possible loss of information from having only a single S.—*Journal abstract.*

5279. Bruhl, Dieter & Solar, Diana. (U. California, Inst. of Human Development, Berkeley) **Systematic variation in the clarity of demand characteristics in an experiment employing a confederate.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 55-60.—Randomly assigned 60 female undergraduates to observe an autokinetic light under 1 of 3 conditions, a no-confederate condition, a silent-confederate condition, and a talking-confederate condition. Predictions derived from M. T. Orne's construct of demand characteristics were generally confirmed, including: (a) variance of social influence scores was greatest for Ss with a confederate whose estimates were unknown to S; and (b) conformity to the verbal estimates of a confederate was greatest for Ss who believed E expected conformity. Findings could not be explained by achievement striving or self-persuasion.—*Journal abstract.*

5280. Johnson, Ronald W. & Adair, John G. (U. Manitoba, Winnipeg, Canada) **The effects of systematic recording error vs. experimenter bias on latency of word association.** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 270-275.—6 male and 6 female undergraduate Es tested 96 male and 96 female undergraduate Ss on a word association task in an attempt to assess the effects of high and low levels of inducement of E expectancy, and the magnitude of O or recorder error and bias affecting Ss' responses, when data were obtained by biased Es. A significant expectancy effect was observed and results indicate that neither O or recorder error nor bias affecting Ss' responses could singularly account for the presence of E-expectancy. The nonsignificant interaction of Level of Inducement \times Expectancy failed to support the hypothesis that high vs. low concern for the data on the part of the principal investigator affects the magnitude of the expectancy effect.—*Journal abstract.*

5281. McFadden, Dennis. (U. Texas) **Three computational versions of proportion correct for use in forced-choice experiments.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 336-342.—Compared 3 commonly used measures of performance in forced-choice experiments, all called proportion correct, as response bias, bias in the stimulus outcomes, and level of performance were varied. Some of the characteristics of the various versions are examined, but no position is taken on which is the computational version of choice.—*Journal abstract.*

5282. Neufeld, Richard J. (U. Calgary, Alberta, Canada) **Generalization of results beyond the experimental setting: Statistical versus logical considerations.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 443-446.—Discusses the conventional distinction between fixed and random variables in analysis of

variance. It is suggested that certain incidental conditions prevailing when experimentation occurs, e.g., time(s) and place(s) of experimentation, can be classified as unbalanced independent variables. Given this classification of these incidental conditions, generalization of experimental results beyond situations exactly duplicating that set of conditions attendant to the experiment, requires either statistical or logical provision. As statistical provision for the entire complex of incidental conditions prevailing during an experiment would be infeasible, logical considerations must be employed in generalization of results beyond the experimental context. It is suggested that to consider incidental conditions of the experimental situation as being unbalanced independent variables should lead to vigilance regarding those incidental conditions possibly contributing to the obtained experimental outcome. Since generalization of obtained results beyond the experimental setting is contingent upon logical considerations, it is suggested that the validity of such logical provision should always be verified by E.—*Journal abstract.*

EXPERIMENTAL PSYCHOLOGY

5299. Bugelski, B. R. (State U. New York, Buffalo) **Words and things and images.** *American Psychologist*, 1970(Nov), Vol. 25(11), 1002-1012.—Explores and evaluates the current renaissance of interest in imagery as a cognitive mechanism, with reference to its role in associative learning, mediation, meaning, and personality. The variable of time is stressed in the formation of effective imagery in mnemonic research. Experiments are described in which Ss, instructed to image but not to learn, were unable to prevent learning. Imagery is relatively free from interference in memorizing successive lists, and highly effective in recall of long lists of concrete and abstract words. Abstract words are frequently transposed into concrete representations. Research employing 3-6 yr. old deaf children without language of any known variety supports assumptions about imagery. (30 ref.)—Author abstract.

PERCEPTION

5300. Anderson, Norman H. (U. California, San Diego) **Test of adaptation-level theory as an explanation of a recency effect in psychophysical integration.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 57-63.—In Exp. I, 20 undergraduates lifted 3 weights in sequence under instructions to judge the heaviness of the last weight. Contrary to adaptation-level theory, these judgments failed to show a contrast effect; instead they showed a small positive context (assimilation) effect. In Exp. II, 40 undergraduates lifted 2 weights in sequence and then judged the heaviness of the 1st or the 2nd. Again, a small positive context effect was observed. A negative time-order effect was also obtained for homogeneous sequences, both of high and of low weights, also contrary to adaptation-level theory. (24 ref.)—Journal abstract.

5302. Cashdan, Sheldon & Zung, Burton J. (U. Massachusetts) **Effect of sensory modality and delay on form recognition.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 458-460.—Exposed 60 undergraduates to a randomized sequence of 58 3-dimensional geometric forms of various sizes and shapes. 20 Ss received visual exposure, 20 Ss received haptic exposure, and 20 Ss received joint visual and haptic exposure. $\frac{1}{2}$ of the Ss in each of the 3 modality conditions were given a recognition test on each object concurrent with exposure to the object, while the remaining Ss were tested subsequent to object exposure. All recognition testing was conducted in the visual modality. Results indicate that Ss performed significantly better on the basis of visual and bimodal input than with haptic input exclusively. The imposition of a delay resulted in significantly poorer performance. A

strong trend toward significance suggests that the effect of a delay is most pronounced with bimodal input.—*Journal abstract.*

5303. Gregory, R. L. (U. Edinburgh, Scotland) **On how little information controls so much behaviour.** *Ergonomics*, 1970(Jan), Vol. 13(1), 25-35.—Discusses perception as a process of the selection of internal models in terms of which incoming data are used to shape behavior. The advantages and disadvantages to the organism of using such models are outlined. The way in which models operate is considered in the light of evidence from perceptual illusions: these can be regarded as cases where a wrong model has been selected, or errors of scaling have occurred. It is suggested that some of the bizarre imagery in dreams and certain abnormal states can also be understood in these terms. When compared with a computer, the perceptual mechanism and its models resemble an analog rather than a digital system. (French & German summaries)—*Journal abstract.*

5304. Haslam, Diana R. (U. Bristol, England) **Lateral dominance in the perception of size and of pain.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 503-507.—Studied perception of size and pain in 55 right-handed and 15 left-handed Ss. For right-handed Ss a significant relationship was found between these 2 types of perception in that Ss who tended to underestimate size with the dominant hand also had a higher pain threshold for the hand as compared with the nondominant hand.—*Journal abstract.*

5305. Hengen, Nona. (Western Washington State Coll.) **The perception of danger in action illustrations.** *AV Communication Review*, 1970(Fal), Vol. 18(3), 250-262.—80 undergraduates were asked to judge the amount of danger in various situations presented in 2 sets of pictures by ranking them from the most to the least dangerous. Pictures varied in 3 characteristics: degree of control, degree of fear, and degree of drop off cliff. Results indicate that significant interpretation differences resulted when selected cues in the pictures were varied from a situation where the cues combined to produce a maximum condition for evoking fear and danger, to a situation in which the cues combined to produce a maximum condition for evoking feelings of escape and safety.—*Journal summary.*

5306. Lobb, Harold. (U. Western Ontario, London, Canada) **Asymmetrical transfer of form discrimination across sensory modalities in human adults.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 350-354.—Investigated symmetry of cross-modal transfer by training 80 undergraduates to discriminate irregular heptagons from transformations, either visually or tactually, and then repeating the procedure with the other modality. Comparisons with unimodal control groups indicated that visual training increased the accuracy of identifying equivalent primary forms by touch. No transfer effect was detected from touch to vision, although the difficulty of visual and tactual discrimination was approximately equated. This finding contradicts a not uncommon belief that cross-modal transfer is superior from touch to vision in normal adults.—*Journal abstract.*

5307. Overmier, J. Bruce. (U. Minnesota) **A note on subception.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 519-524.—Notes that the usefulness of subception in the analysis of problems in perception and personality is

dependent upon the hypothetical autonomic discriminatory process being more sensitive than the conscious discriminatory process. A recently proposed index by K. Chun and T. R. Sarbin (see PA, Vol. 42:11441) of subception was analyzed and found not to require greater autonomic sensitivity as a condition for subception. It is shown that random nondiscriminatory autonomic responding can result in subception of discriminatory verbal responding given this index. A simple graphic analytical procedure based upon modern psychophysical techniques is recommended and demonstrated.—*Journal abstract.*

5308. Rashid, M. A. (Establishment Div., Government of Pakistan) **Rhythmic perception and human behaviour: III. Rhythmic perception, age, intelligence, and musical perception.** *Pakistan Journal of Psychology*, 1970(Jun), Vol. 3(1-2), 3-15.—Presents the 3rd and 4th experiments of a series designed to examine the relation between rhythmic perception and human behavior. In Exp. III 47 boys and 49 girls from 3 secondary schools in Liverpool, England were divided into 12 groups in a $3 \times 2 \times 2$ factorial with age (9, 12, and 15 yr.), intelligence (as measured by the Progressive Matrices and Mill Hill Vocabulary scale scores), and musical perception (as measured by the 1st test of the Wing's Music Test) as independent variables. The dependent variable was rhythmic perception as measured by tests constructed by the author. Results indicate all main effects and the Age \times Intelligence interaction were significant. Exp. IV involved a similar design, differing only in age groups: 18-30, 40-50, and 60-70 yr. Results indicate significance for all main effects and no interactions. With further analysis it is concluded that: (a) there is a gradual increase in rhythmic perception ability from 9-15 yr., with no difference between 18-30 and 40-50 yr. age groups, but a decrease in the 60-70 yr. age group; (b) rhythmic perception is closely related to intelligence; and (c) rhythmic and musical perception do not appear to be related in 9- and 12-yr-olds, but from 15 yr. forward there is a positive relationship.—*R. Wiltz.*

5309. Ross, John & Di Lollo, Vincent. (U. Western Australia, Nedlands) **A consistent failure of the power law for lifted weight.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 289-290.—In the course of a series of experiments concerned primarily with contrast effects in the judgment of lifted weights, a set of results has accumulated that appears to speak decisively against a power law for lifted weight formulated by S. S. Stevens and E. Galanter (see PA, Vol. 33:2792). In each case the method of direct magnitude estimation was employed. The significance of these findings is discussed.—*Journal abstract.*

5310. Rule, Stanley J., Curtis, Dwight W., & Markley, Robert P. (U. Alberta, Edmonton, Canada) **Input and output transformations from magnitude estimation.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 343-349.—Obtained judged magnitudes of difference in area of paired circles and magnitude estimations of the circles making up the pairs from 12 undergraduates. The difference judgments were subjected to nonmetric scaling, and a 1-dimensional solution was obtained. The relationships between scale values and physical area and between judged difference and derived distance were each characterized by power functions. The product of exponents from the 2 functions closely predicted judgments of individual circles. Judgments of differences between paired weights were subjected to the

same analysis. The relationships between scale values and physical weight and between judged difference and derived distance were power functions for both pooled data and data from individual Ss, indicating that in- and output transformations in magnitude estimation are power functions.—*Journal abstract.*

5311. Welford, A. T. (U. Adelaide, South Australia) **Perceptual selection and integration.** *Ergonomics*, 1970(Jan), Vol. 13(1), 5-23.—Presents broad principles and recent theoretical and practical trends in the area of perceptual selection and integration. Perception involves both a selection from, and an integration of, the data conveyed to the brain from the sense organs. Selection seems to be made in terms of both simple sensory qualities and more complex semantic aspects of incoming data, and appears to result in unwanted data being attenuated. It is achieved at some cost, as is shown by the fact that selection commonly takes a time which increases with the degree of specificity to which it is carried. Research results do not yet fully agree upon the extent to which different features of incoming data are selected simultaneously or successively. Perceptual integration appears to achieve economy of decision in the sense that it enables a large quantity of incoming data to be handled as a limited number of units. Of the various ways in which this is achieved, the extraction of rates of change and of time-sequences, the imposition of schemata or templates from past experience, and the building of perceptual frameworks in both space and time are considered. (French & German summaries) (77 ref.)—*Journal abstract.*

Illusion

5312. Cooper, Michael R. & Runyon, Richard P. (C. W. Post Coll., Long Island U.) **Error increase and decrease in minimal form of Mueller-Lyer illusion.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 535-538.—Based upon prior research showing that the error associated with the Sander parallelogram is maximal when the diagonal lines are physically omitted rather than physically present, an attempt was made to determine if a similar finding might result from eliminating the shaft in the Müller-Lyer illusion. Ss were 28 undergraduates. An interaction was found between shaft vs. no-shaft condition and fins-in vs. fins-out. Eliminating the shaft significantly increased error in the fins-in condition and significantly decreased error in the fins-out condition. Results are consonant with the previous study involving the Sander parallelogram.—*Journal abstract.*

5313. Day, R. H. & Wong, T. S. (Monash U., Clayton, Victoria, Australia) **Radical and tangential movement directions as determinants of the haptic illusion in an L figure.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 19-22.—Describes 2 experiments, with 14 volunteer Ss in each, on the difference in haptically judged extent of 2 raised edges forming an L. Data from Exp. I show that when movements of the outstretched arm and finger along both components of the L are tangential, there is no difference in their apparent lengths, but that when movement along 1 is tangential and the other radial, the latter is apparently longer. In Exp. II a different type of movement involving different joints was required, but results are essentially the same. Data from both experiments confirm earlier findings on the relative apparent extents of tangential

and radial movement and are interpreted as demonstrating the absence of a relationship between visual and haptic illusions of length in an L figure.—*Journal abstract.*

5314. Graham, C. H. & Gillam, B. J. (Columbia U.) **Occurrence of theoretically correct responses during rotation of the Ames window.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 257-260.—Tested the hypothesis that reversals in the Ames window are the outcome of a resolution of ambiguous differential angular velocity cues by linear perspective cues. A parallel projection of the window on an opal glass screen was used as the stimulus. 14 Ss almost always reported 2 apparent reversals/rotation. The long vertical side of the figure was always apparently in front of the short vertical side. Results are interpreted to be in line with theoretical expectations.—*Journal abstract.*

5315. Gregory, Richard L. (U. Edinburgh, Scotland) **Visual illusions.** *Scientific American*, 1968(Nov), Vol. 219(5), 66-76.—Reviews and illustrates some of the visual illusions described by investigators during the past century (e.g., the transparent rhomboid of Necker in 1832 and the illusion by Franz Müller-Lyer in 1889). It is suggested that nonvisual characteristics of perception must be associated with the visual image, by learning or possibly through heredity, for external objects to be recognizable from their retinal images. Perception may be a "matter of looking up information that has been stored about objects and how they behave in various situations." Illusions may, therefore, be the "result of the imperfect solutions available to any data-handling system faced with the problem of establishing the reality of objects from ambiguous images."—P. McMillan.

5316. Kolars, Paul A. & Pomerantz, James R. (U. Toronto, Ontario, Canada) **Figural change in apparent motion.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 99-108.—Students of illusory motion have usually presented identical shapes as stimuli. The present experiments used disparate shapes and studied the way Ss (5 clerical employees and 2 authors) resolved the disparities. 3 kinds of resolution were found: translation (traditional beta motion), plastic deformation of contours, and rotation of rigid shapes in depth. Increasing stimulus duration increases the likelihood of all 3, but changes in depth occur at longer interstimulus intervals than changes of shape. The influence of shape itself in resolving disparities was found to be very small, and when more than 1 change was required to resolve a disparity, the multiple changes were found to occur simultaneously. (15 ref.)—*Journal abstract.*

5317. Moses, Franklin L. & DeSisto, Michael J. (Tufts U.) **Arm-movement responses to Müller-Lyer stimuli.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 376-378.—Investigated similarities between eye- and arm-movement patterns during the Müller-Lyer illusion to find out if characteristics of a visual illusion would be reflected in tracings of an unseen arm. 6 stimuli, 3 experimental and 3 control, were presented 5 times to each of 7 undergraduates who were familiar with the illusion. Data were analyzed by measuring lengths of tracings and by making intraindividual comparisons using t tests for correlated means. Results for the arm are similar to those reported elsewhere for the eye. Arrows with outward-directed obliques were traced longer than arrows with inward-directed obliques, as well as longer than control stimuli. Agreement between eye- and arm-movement responses to the illusion lend support for

using each technique to investigate stimuli that affect man's distance metric.—*Journal abstract.*

5318. Stevens, Joseph C. & Rubin, Lee L. (John B. Pierce Foundation Lab., New Haven, Conn.) **Psychophysical scales of apparent heaviness and the size-weight illusion.** *Perception & Psychophysics*, 1970(Oct), Vol. 8(4), 225-230.—14 adult Ss used the method of magnitude estimation to scale the apparent heaviness of a set of 40 cylindrical objects that varied in weight, volume, and density. There were 3 main conclusions: (a) For any constant volume, heaviness grows as a power function of weight; the larger the volume, the larger the exponent of the power function. The family of such power functions converge at a common point in the vicinity of the heaviest weight that can be lifted. (b) For any constant density (i.e., weight proportional to volume), heaviness does not grow as a power function of weight. (c) For any constant weight, heaviness decreases approximately as a logarithmic function of volume; the constants of the log function depend systematically on the weight of the object. The outcome furnishes a broad quantitative picture of apparent heaviness and of the size-weight illusion (Charpentier's illusion).—*Journal abstract.*

5319. Zenhausen, Robert; Hansen, Karen, & Sobrien, Sonya. **Order effects in perception of two trapezoidal illusions.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 355-366.—Performed 2 experiments in which 96 experimentally naive Ss with normal vision served in more than 1 condition to determine order effects on 2 trapezoidal perceptual illusions. In Exp. I expected differences in illusory experiences were a function of complex order effects. In Exp. II similar order effects significantly influenced the number of illusory experiences reported for 3 angles of oscillation.—*Journal abstract.*

Time

5320. Gibbon, John & Rutschmann, Ruth. (New York State Psychiatric Inst., New York) **Temporal order judgment and reaction time.** *Science*, 1969(Jul), Vol. 165(3891), 413-415.—Proposes a model which predicts judgment of the temporal order of stimuli from simple RT. Visual data show covariation of the 2 measures with luminance changes, and suggest that (a) temporal order judgments reflect a biased response criterion, and (b) the motor component of RT has little variability relative to variance in receptor system latency.—*Journal abstract.*

5321. Graef, Jed R. (U. Michigan) **The influence of cognitive states on time estimation and subjective time rate.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 897.

5322. Hoyer, William J., Jones, Elvis C., White, Roland S., & Maconachy, William V. (Frostburg State Coll.) **Effects of knowledge of the ITI on time estimates.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 392-394.—Exp. I with 37 undergraduates investigated the effect of knowledge (K) of a 10-sec ITI on estimates of 4 different durations (8, 12, 20, and 32 sec.). The main effect of K was significant ($p < .005$). Exp. II examined the effect of K over trials using a single interval (27 sec.). Ss were 28 naive undergraduates. The main effect of K was significant ($p < .005$), but the $K \times$ Trials interaction was not significant. The effect of K was immediate, and in both experiments, facilitated time estimation.—*Journal abstract.*

VISION

5323. Dewar, Robert. (U. Calgary, Alberta, Canada) **Adaptation to displaced vision: Amount of optical displacement and practice.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 313-316.—Examined the influence of 2 variables, length of exposure and amount of optical distortion, on adaptation to displaced vision in 104 16-28 yr. old right-handed Ss. The extent of adaptation was positively related to number of trials in a task involving spatial localization of a target displaced by a wedge prism. A substantial adaptation (38%) was produced after only 2 trials. The adaptation was also positively related to degree of optical displacement, except at the highest level used. Findings are discussed in terms of availability of information about the discrepancy between vision and task. (21 ref.)—*Journal abstract.*

5324. Gippeneiter, Yu. B., Romanov, V. Ya., & Smirnov, S. D. (Moscow State U., USSR) **O dvizhenii glaz i ruki v protsesse schëta élementov test-ob"ekta.** [On movement of the eyes and hand in the process of counting the elements of a test object.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 51-56.—11 Ss participated in a study of the motor component in visual counting (simultaneous presentation of 7-26 stripes in 2-3 min. with angular density of 7'-10' and 20'-35', with and without pressing a push button with each count). It is shown that certain characteristics of the saccadic movements of the eye, when counting, are not connected with the function of taking in visual information as such, but are determined by the specific nature of the operation performed. The necessity of discrete motor acts in the process of counting is disclosed. These acts may be localized in the different motor organs, and in specially organized conditions transference of the function of discrete counting is possible from the eyes to the hand.—I. D. London.

5325. Gordeeva, N. D., et al. (Moscow State U., USSR) **Issledovanie informatsionnogo poiska pri formularnom sposobe pred'yavleniya informatsii.** [Study of informational search when the formulary method of presenting information is employed.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 71-79.—Reports results of 4 experimental series in a study of the parameters of visual search (time, duration, and number of fixations; their temporal and spatial distribution; route of eye movements) as a function of method of presenting information (formulary and mixed). 5-30 formularies were employed with the number of parameters ranging from 1-7. Time of search is shown to be a function of the number of formularies and parameters found in the informational field. Average duration of visual fixation was not a function of the number of formularies and parameters. Investigation of the trajectories and of the number of steps involved in visual search made it possible to understand the sequence and logic of the operations which entered into the composition of informational search. Change in the structure of the informational field, brought about through analysis of the trajectories and number of steps utilized in informational search, provided a necessary basis for a sharp diminution in time of informational search.—I. D. London.

5326. Hill, Adrian R. (City U., London, England) **Towards a psychophysical scale of visibility.** *American Journal of Optometry & Archives of American*

Academy of Optometry, 1970(Jan), Vol. 47(1), 36-44.—Scaled the sensory mode "ease of seeing" by the technique of direct magnitude estimation in an experiment with 20 architecture students. The derived scale is a power function of visual acuity measured with equivalent stimulus values. Findings suggest that, if visual acuity measurements are to be representative of the sensation "ease of seeing," then the character sizes on visual test charts must be graded in a geometric progression of visual angle. A scale of visual utility is proposed in which it is possible to express changes in basic visual acuity measurements (e.g., Snellen fractions), in terms of multiples or fractions of unitary changes in visibility. (24 ref.)—*Journal abstract*.

P. **Modelirovanie protsessov pervichnoi obrabotki informatsii v zritel'nom analizatore s pomoshch'yu televizionnoi sistemy.** [Modeling the processes involved in the primary treatment of information in the visual analyzer with the aid of a television system.] *Problemy Bioniki*, 1970, No. 3, 142-148.—Analyzes a physical model of the simplest nervous systems, constructed on the basis of TV apparatus, utilizing a regulated form of defocusing of the scanning rays in the transmission and reception TV tubes.—*I. D. London*.

5330. Shabanov-Kushnarenko, Yu. P. & Shul'gin, I. V. **Matematicheskaya model' preobrazovaniya koordinat v pole zreniya.** [A mathematical model for the transformation of coordinates in the visual field.] *Problemy Bioniki*, 1970, No. 3, 127-128.—Examines several questions concerning the "transformation of the visual picture in visual sensation." It is shown that it is possible to consider the coordinate system in a plane, perpendicular to the visual axis, as undeformed only in the central part of the visual field; deformation of the coordinate system takes place in the peripheral parts of the visual field.—*I. D. London*.

5331. Tresselt, M. E., Mayzner, M. S., Schoenberg, K. M., & Waxman, J. (New York U.) **A study of sequential blanking and overprinting combined.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 261-264.—By presenting alphabetic and other types of input characters, in either adjacent or the same spatial locations on the face of a CRT interfaced to a digital computer and by varying in systematic ways the interstimulus intervals and display orders of the several sequentially presented inputs, there has evolved blanking-overprinting paradigm. The use of such a paradigm with 24 adult Ss disclosed that the visual system can operate in a very sensitive and highly selective manner,

clearing the 1st of 2 overprinted inputs that are separated in time by as little as 50 msec., while selectively inhibiting the 2nd of these 2 overprinted inputs, if appropriate blanking inputs are present. (20 ref.)—*Journal abstract*.

5332. Uttal, William R. & Hieronymus, Ramelle. (U. Michigan) **Spatio-temporal effects in visual gap detection.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 321-326.—Studied the ability of the visual system to process temporal information with regard to the interactions between temporal and spatial stimulus dimensions. A comparison of results of 2 experiments with 4 female Ss indicates that the eye is able to discriminate temporal gaps in a train of visual flashes better when the flashes are spatially superposed than when they are dispersed. The inertial and integrating properties of the visual receptor seem to hinder the discrimination less than does spatial dispersion. However, an analysis of the results, using J. Z. Levinson's low-pass filter model, suggests that the increased discrimination is due to the recoding of the temporal stimulus information along a brightness dimension, and thus the true temporal properties of the visual system are probably better described by the dispersed rather than the overlapped condition. Other experiments are also reported that deal with the ability of human Ss to deal with the temporal information pattern of visual stimuli.—*Journal abstract*.

5333. Wade, N. J. (U. Dundee, Scotland) **Effect of prolonged tilt on visual orientation.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 423-439.—Views visual orientation during lateral tilt in terms of orientation constancy. The postural systems involved in the maintenance of constancy are considered to be the otolith, neck, and trunk. The relative contribution of these systems was investigated by obtaining visual verticality judgments immediately upon and several min. after head, body, and trunk tilts. Due to the apparent nonadaptation of the otolith system any changes in visual orientation resulting from prolonged tilt would be attributed to adaptation of the proprioceptive system stimulated. For 30° head tilt visual orientation overconstancy was reduced by about 2°, reflecting the influence of the neck system. Prolonged body tilts of 30, 60, and 90° reduced the constancy operating by approximately 1, 3, and 8°, respectively. This indicates the contribution of the trunk system, which increased with increasing degrees of body tilt. The above interpretations received strong support from experiments involving trunk tilt, which stimulates only the neck and trunk systems. (35 ref.)—*Journal abstract*.

5334. Wade, N. J. (U. Dundee, Scotland) **Visual orientation during lateral head tilt when upright and supine.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 420-422.—Investigated egocentric visual orientation of 10 undergraduates with lateral head tilts relative to the upright and supine trunk. A significant difference was found in the trend of visual head axis judgments between 40° left and 40° right head tilt for the 2 conditions: they varied systematically with the degree of tilt for the upright but not for the supine condition.—*Journal abstract*.

Perception

5335. Baird, John C., Lewis, Charles, & Romer, Daniel. (Dartmouth Coll.) **Relative frequencies of numerical responses in ratio estimation.** *Perception &*

Psychophysics, 1970(Nov), Vol. 8(5-B), 358-362.—Investigated the frequency of different numerical responses in ratio estimation as a function of the numerical categories actually used by 116 Ss. Analyses were conducted for 3 series of experiments involving magnitude and free-ratio estimation for the attributes of stimulus length, area, and distance. It was found that Ss use certain numerical categories (e.g., multiples of 1, 10, and 100) much more frequently than others (e.g., 37.5) and that the choice of category depends upon the order of magnitude of the response. The statistical implications for ratio scaling are worthy of notice.—*Journal abstract*.

5336. Berlyne, D. E. (U. Toronto, Ontario, Canada) **Novelty, complexity, and hedonic value.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 279-286.—2 experiments, in which 136 undergraduates were exposed to sequences of colored shapes, investigated effects on ratings of "pleasingness" and "interestingness" of variables that had previously been shown to affect ratings of "novelty." Results indicate that both pleasingness and interestingness increase with novelty. These findings run counter to those of experiments indicating an inverse relation between novelty and verbally expressed preference. 2 further experiments using 96 Ss examined effects of some variables that might account for this apparent discrepancy. Homogeneous sequences declined in judged "pleasantness" more than sequences in which several stimuli were interspersed, and simple stimuli became less pleasant as they became less novel, while complex stimuli declined less or became more pleasant. Findings are related to hypotheses regarding mechanisms of hedonic value. 2 crucial predictions were confirmed in a 5th experiment. (19 ref.)—*Journal abstract*.

5337. Bernstein, Alvin S., et al. (State U. New York, Downstate Medical Center, Brooklyn) **Orienting response and apparent movement toward or away from the observer.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 37-45.—In an experiment with 80 paid volunteer Ss, it was found that the orienting response (OR) displayed heightened reactivity in both GSR and pulse volume components to the onset of apparent movement in the visual field. Presenting filmed geometric patterns, both movement toward, and movement away from, S produced greater OR than that elicited simply by the changes in line thickness and density involved. However, movement toward S especially triggered strong and relatively enduring ORs. Results suggest that the onset of movement in the visual field is associated with a momentary increase in perceptual receptivity. When environmental objects appear to approach S, such heightened receptivity may continue for a relatively prolonged period. Where movement away from S occurs, however (at least where innocuous, nonmeaningful stimuli are involved), this initially heightened sensitivity promptly diminishes, possibly because the receding stimulus is of little further significance. (16 ref.)—*Journal abstract*.

5339. Grossberg, Mitchell. (Massachusetts Inst. of Technology, Lincoln Lab.) **"Backward masking" of simple detection latencies.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 308-312.—Determined simple detection latencies with stimuli that comprised 2 suc-

cessive flashes. The 2nd flash either equaled or exceeded the 1st in luminance, duration, or both. When a low-luminance flash preceded either a low- or a high-luminance flash, the flashes summated, yielding latencies that were shorter than the latency for the 1st flash alone. In the limit, when the 2nd flash was intense and followed the 1st by a short time, the latency for the paired flashes behaved as if it was determined by the 2nd flash alone. This limit was analogous to the retroactive interference in studies of the neurophysiological concomitants of backward masking. S was 1 highly trained adult. However, the S in masking studies detects the 1st flash despite interference by the 2nd, whereas the present S detected the onset of the stimulus light. The need for an analysis of the S's response under masking is thus indicated.—*Journal abstract*.

5340. Halmiová, Ol'ga; Dornič, Stanislav; Jelenková, Alena, & Arochová, Ol'ga. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Effect of short-term memory load and strength of the nervous system on search time.** *Studia Psychologica*, 1970, Vol. 12(3), 238-243.—A comparison of search time in a simple task and in 1 with short-term memory loading showed it to be significantly prolonged in the latter tests. In an experiment with 30 16-18 yr. old boys and girls, Ss recalled correctly only 15% from the given stimuli. When they were divided into a strong and a weak group, differences of statistical significance became apparent in favor of the weak group when short-term memory was loaded. (Czech & Russian summaries)—*Journal abstract*.

5341. Hershberger, Wayne A. & Urban, Daniel. (Northern Illinois U.) **Three motion-parallax cues in one-dimensional polar projections of rotation in depth.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 380-383.—A polar projection of a dotted line rotating in depth incorporates 3 distinct cues to direction of rotation: (a) the direction (D) in which the motion of dots on opposite ends of the line are periodically congruent, (b) the order (O) in which the dots reach their respective limits of angular displacement in the visual field, and (c) the differential retinal velocity (V) of dots on the near vs. the far side of the axis of rotation. 24 undergraduate Os repeatedly viewed each of 3 polar projections of a dotted line rotating in depth; 1 incorporating only cue V, another, cues D and V, and a 3rd, cues O and V. Os' identification of rotation direction using cue V alone was better than chance, and improved significantly with the addition of either of the other cues. Performance improved with practice using the 2-cue projections but declined using the V projection.—*Journal abstract*.

5342. Kinsbourne, Marcel & Evens, Nicholas. (Oxford U., Inst. of Experimental Psychology, England) **Is the word frequency effect on recognition threshold a function of transitional probability?** *Psychological Reports*, 1970(Aug), Vol. 27(1), 143-145.—Frequently used 5- and 6-letter words incorporate letter sequences of higher digram and trigram frequency than rare words. This could account for some or all of the frequency of usage effect on word recognition threshold.—*Journal abstract*.

5343. Krueger, Lester E. (Harvard U.) **The effect of acoustic confusability on visual search.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 389-400.—Ss searched more slowly through same-sounding visual displays in which the letters, when pronounced,

matched the vowel sound of the target letter than through different-sounding displays indicating that Ss do form acoustic representations of display letters in visual search. Ss were 10 undergraduates in Exp. I, and 20 in Exp. II. Ss also made more errors on same-sounding than different-sounding displays. Search was slowed to a greater extent on same-sounding displays for Ss who more frequently subvocalized the target letters.—*Journal abstract.*

5344. Krylova, N. V. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Izuchenie pri pomoshchi samonastraivayushchegosya éksperimenta nekotorykh osobennostei ritmicheskoi dvigatel'noi deyatel'nosti cheloveka.* [Study of some features of rhythmic motor activity in man, making use of the self-adjusting experiment.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 305-312.—5 Ss participated in a computer-involved study of the features of tracking temporal intervals between clicks when the stimulating rhythm undergoes sudden change. 2 distinct mechanisms of transition to a new rhythm were established (a) "sliding" (gradually, by small steps), if, at the moment of change in rhythm, the S was engaged in exact tracking (interval between stimuli changed by 5% of the given magnitude); (b) "saltation" (by sharp, extrapolational steps), if the S was in a state of discordance when the interval is changed by 10-20%. The magnitude of change in the interval between stimuli influenced the character of the transition only if, at the moment of change in the rhythm, S was engaged in exact tracking. If at that moment S was in a discordant state, the transition to the new rhythm occurred as a "saltation." The character of the transitions was under the same conditions for all the intervals investigated (.3, 1, 2 sec.).—*I. D. London.*

5345. Mack, Arien. (New School for Social Research) *An investigation of the relationship between eye and retinal image movement in the perception of movement.* *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 291-298.—Investigated whether or not eye movements accompanied by abnormal retinal image movements, movements that are either or both at a different rate or in a different direction than the eye movement, predictably lead to perceived movement. 14 undergraduate Os reported whether or not they saw a visual target move when the movement of the target was either dependent on and simultaneous with their eye movements or when the target movement was independent of their eye movements. Observations were made when the ratio between eye and target movement was 2/5, 1/5, 1/20, and 0. All these ratios were tested when the direction of the target movement was in the same, opposite, and at right angles to the movement of the eyes. Eye movements, target movements, and reports of target movement were recorded. Results indicate that a discrepancy between eye and target movement greater than 20% predictably leads to perceived target movement, whereas a discrepancy of 5% or less rarely leads to perceived movement. Results are interpreted as support for the operation of a compensatory mechanism during eye movements.—*Journal abstract.*

5346. Marshall, A. J. (U. Western Australia, Perth) *Sensory and attentional devices in visual perception.* *Australian Psychologist*, 1969(Mar), Vol. 3(3), 124-139.—Discusses some work concerned with perception under various kinds of difficult viewing conditions, focusing on sensory and attentional devices and

Galton's studies. Possibilities for what might be gained by carrying out further studies are also considered.

5347. Masland, Richard H. (Stanford U., Medical School, Div. of Neurology) *Visual motion perception: Experimental modification.* *Science*, 1969(Aug), Vol. 165(3895), 819-821.—In an experiment with 45 male undergraduates, it was found that if a human O fixates a moving spiral pattern for 15 min., a negative aftereffect of motion is perceived when he inspects a stationary spiral 20 hr. later. The illusory motion is seen only when the stationary test stimulus falls upon the portion of the retina which had been stimulated by real motion. Thus previous stimulation can cause a relatively long-term modification of vision.—*Journal abstract.*

5348. Metelli, F. (U. Padova, Italy) *An algebraic development of the theory of perceptual transparency.* *Ergonomics*, 1970(Jan), Vol. 13(1), 59-66.—Describes an experiment concerning the dependence of the perception of transparency upon both figural relationships and color-relationships in a pattern. By expressing in algebraic terms the chromatic aspects of the perceptual phenomenon of transparency and solving the resulting system of 2 equations, it was possible to deduce from the solutions some necessary conditions of the phenomenon, which were confirmed by results of qualitative experiments. (French & German summaries)—*Journal abstract.*

5349. Mikhailov, S. A. & Pitanova, A. V. (Moscow State U., USSR) *O simul'tanirovaniĭ posledovatel'nogo ryada razdrzheniĭ v zritel'noi sisteme cheloveka.* [On simulation of a successive series of stimulation in the human visual system.] *Psikhologicheskĭe Issledovaniya*, 1969, No. 1, 134-138.—5 Ss participated in a study to (a) elucidate the process whereby the entire contour of plane geometrical figures may be simultaneously perceived when separate elements of the contour are successively fed into the visual system as inputs, and (b) determine the temporal characteristics of this process. Data, resulting from utilizing different speeds for the scanning cycle, are presented.—*I. D. London.*

5350. Neisser, Ulric. (Cornell U.) *The processes of vision.* *Scientific American*, 1968(Sep), Vol. 219(3), 204-214.—Discusses the role of the eye and the brain in various aspects of visual perception and memory. It is noted that neither in perceiving nor in remembering is there a lasting copy of the optical input as in the case of a camera or a recording instrument. In perception, complex patterns are selected from input and fed into "constructive processes of vision" so that the inner experience of a perceiver usually corresponds well with the external environment. Visual memory differs from perception in that it is based primarily on stored instead of current information but entails a similar process of synthesis.—*P. McMillan.*

5351. Paivio, Allan & O'Neill, Brian J. (U. Western Ontario, London, Canada) *Visual recognition thresholds and dimensions of word meaning.* *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 273-275.—Obtained tachistoscopic recognition thresholds from 10 undergraduates for nouns with high or low values on 1 dimension of meaning while 2 others were controlled. Frequency, imagery concreteness, and meaningfulness (m), were varied in different lists in 1 experiment, frequency and m in a 2nd, and m alone in a 3rd. Ratings of familiarity were also obtained to supplement frequency as a measure of familiarity. Results show that ease of

visual recognition was most strongly related to frequency and familiarity. Imagery was unrelated to thresholds when familiarity and m were controlled. Meaningfulness showed a small but consistent positive relation to ease of recognition even with the other variables held constant. Except for the puzzling effect of m , results are consistent with the view that perceptual recognition is primarily dependent upon the familiarity of the target stimulus and not upon associative processes evoked by it. 5352. Rousseau, Robert & Lortie, J. Yves. (U. Laval, Quebec, Canada) **Decrease and increase in target detection induced by adjacent borders.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 483-488.—Controlled the facilitatory effect on target detection due to the distance between inducing fields and the duration of target presentation. 2 experienced Os participated in the study. It appeared that such an effect exists for a distance of $1^{\circ}3'$ between the active fields. However, it seems to be strongly related to a critical range of duration of target presentation. (20 ref.)—*Journal abstract*.

5353. Sanders, A. F. (Inst. for Perception RVO-TNO, Soesterberg, Netherlands) **Some aspects of the selective process in the functional visual field.** *Ergonomics*, 1970(Jan), Vol. 13(1), 101-117.—Reviews a group of experiments on performance as a function of display angle, describing the perceptual strategies used with signals at various angular separations. Exp. I used a simple 4-choice discrimination task. Results show a nonlinear decrease of performance as a function of display angle, related to the necessity of making eye and head movements when shifting from 1 signal source to the other. It is suggested that the nonlinearity is due to changes of strategy. A preliminary theory about selective processes is formulated and tested in a number of tasks. (French & German summaries) (27 ref.)—*Journal abstract*.

5354. Smith, W. M. (Dartmouth Coll.) **Visually-guided behaviour and behaviourally-guided vision.** *Ergonomics*, 1970(Jan), Vol. 13(1), 119-128.—Outlines temporal integration in perceptually-guided behavior, and the effects of disturbing the normal temporal and spatial relationships between perceptual display and responding action. Characteristics of the cybernetic, feedback model of behavior are discussed, and evidence is cited showing that the effects are often highly specific to particular tasks and are affected by difficulties from factors other than temporal and spatial disturbances. A reappraisal of accepted ideas on sensory-motor performance is suggested, which will more thoroughly incorporate the implications of sensory feedback resulting from action. (French & German summaries) (19 ref.)—*Journal abstract*.

5355. Sylvester, John D. **The concept of the "visual computer" and its exploration by the use of drugs.** *Studia Psychologica*, 1970, Vol. 12(3), 227-237.—Argues that the Gestaltist's position on visual perception and associated theories are untenable with the known facts of perception, and that most learning theories of perception are incomplete. A cybernetic theory of visual perception is presented which (a) helps to resolve the nature-nurture controversy, (b) describes details of higher cortical processes, and (c) accounts for the connection between personality and individual differences in perception. 2 experiments are described, using a combination of cue reduction and drugs. Results indicate that in conditions

of cue reduction, both size and shape constancy are diminished by sodium amyltal, a depressant drug. Probabilities indicate a reduction of efficiency of the perceptual computer rather than a reduction of physiological cues. Experiments strongly support the concept of a visual computer as described in this study. (Czech & Russian summaries) (22 ref.)—*Journal abstract*.

5356. von Békésy, Georg. (U. Hawaii, Lab. of Sensory Sciences) **Apparent image rotation in stereoscopic vision: The unbalance of the pupils.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 343-347.—In binocular vision the apparent rotation of an object relative to the frontal plane seldom corresponds with the actual rotation. The reason for this is a difference in the brightness of the object in both eyes. Unbalance was produced by placing a density filter before 1 eye of each of 3 Os, and the corresponding rotations were then measured. The rotations were affected by the irradiation in the eye, as a physical component, but also by the lateral inhibition in the visual nervous system. If the object and the background had a different color but there was no brightness difference on the edges of the object, there was no distorted rotation. (17 ref.)—*Journal abstract*.

5357. Wade, N. J. (Max Planck Inst. for the Physiology of Behavior, Seewiesen, W. Germany) **The effect of stimulus line variations on visual orientation with head upright and tilted.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 177-185.—Investigated the effects of different line length, width, and luminance on the visual vertical with head upright and tilted in 5 experiments with 10 undergraduates each. With head upright the visual vertical was located accurately under all combinations of stimulus properties. With 30° head tilt the E-effect was produced, and its magnitude was not affected by variations in line luminance and width (at constant luminous flux). The E-effect was reduced by increased line width (at constant luminance) and length. The former was attributed to an interaction between line width and luminance. The latter was considered to be due to differential eye movements when scanning a longer line, as brief presentation of the line abolished the line length difference. Although the variations in the E-effect were small relative to the orientation constancy operating, consideration should be given to the stimulus properties used when comparing data from different experiments.—*Journal abstract*.

5358. White, Murray J. (Victoria U., Wellington, New Zealand) **Visual field differences and the recognition of alpha-numeric material.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 311-317.—8 male graduate and undergraduate students identified and localized letters and digits from displays presented, at brief exposures, (a) to the left of a central fixation point, (b) to the right of fixation, and (c) to the left and right of fixation. No differences were observed with respect to visual fields in identification scores, but a significant interaction between visual field and presentation condition was found in localization scores.—*Journal abstract*.

5359. Young, Forrest W. (U. North Carolina, L. L. Thurstone Psychometric Lab.) **Nonmetric scaling of line lengths using latencies, similarity, and same-different judgments.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 363-369.—Investigated the relation between various ways of deriving psychophysical functions for line length. A 2-phase computer-

controlled experiment in which the stimuli were pairs of lines was performed by 15 undergraduates. In Phase I, the pair was presented for several seconds and S made a category judgment of the similarity of the lines. In Phase II, the pair was presented for a very brief period of time and S decided whether the lines were the same or of different lengths. 3 sets of data were analyzed: (a) the similarity judgments, (b) the proportion of correct judgments, and (c) the latency of the correct different judgments. An individual differences analysis indicates that there were individual differences in the similarity and latency data. This analysis was not applicable to the proportion data. Nonmetric scaling reveals that the psychophysical functions based on all 3 sets of data were essentially identical. (16 ref.)—*Journal abstract*.

Size & Distance & Depth Perception

5360. Dymerskiĭ, V. Ya. & Belik, Ya. Ya. (Moscow State U., USSR) *O vospriyatii izmeneniya udalennosti ot ploskoi poverkhnosti*. [On the perception of changes of distance from a plane surface.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 125-128.—Presents the derivation of a mathematical formula, yielding a measure of change, at each given moment, of the visible speed of points in the visual field with change in distance of the O, moving perpendicularly to the plane.—*I. D. London*.

5361. Epstein, William & Morgan, Cynthia L. (U. Wisconsin) *Adaptation to uniocular image magnification: Modification of the disparity-depth relationship*. *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 322-329.—Exposed 12 undergraduates with uncorrected vision to a meridional size lens for 1 hr. Measures of adaptation and aftereffect showed significant adaptive shifts. 12 controls, who were exposed to nondistorting plain glass for 1 hr. did not show shifts. Results are a reevaluation of the relationship between binocular disparity and perceived depth as a result of exposure to informational discrepancy.—*Journal abstract*.

5362. Farnè, M. (U. Bologna, Italy) *Visual after-effects in the third dimensions: The importance of margins*. *Ergonomics*, 1970(Jan), Vol. 13(1), 83-88.—Experimentally naive medical students, 10 in each of 4 conditions viewed a surface slanted from the frontal plane at 67°. In the 1st condition, this surface had a regular, horizontal texture and was seen through a square window that hid its edges. In the 2nd condition, the same surface was seen between margins which appeared to converge with distance due to perspective effects. In the 3rd condition, the texture was oriented vertically, and seen through the window. In the last condition the surface from the 3rd condition was seen with margins as in the 2nd condition. After having inspected this surface for 5 sec., Ss had to judge the distances of 2 vertical, parallel lines, shown for 250 msec. Results show that the line falling in the place that corresponded to the more distant part of the surface was seen as nearer than the other. This illusory displacement was stronger when the texture of the surface was vertical, and when it was displayed between margins. The 3rd condition presents a clear example of visual aftereffects in the 3rd dimension that cannot be explained in terms of aftereffects which occur in the frontal plane. (French & German summaries) (20 ref.)—*Journal abstract*.

5363. Freeman, R. B. (Pennsylvania State U.) *A psychophysical metric for visual space perception*.

Ergonomics, 1970(Jan), Vol. 13(1), 73-81.—Proposes a new psychophysical metric for the measurement of visual cues in space perception. Its application to the discrimination of distance by means of binocular disparity, monocular movement parallax, and linear perspective is discussed. Experiments are described in which the validity of the proposed psychophysical metric is tested in relation to judgments of visual slant and shape. (French & German summaries) (19 ref.)—*Journal abstract*.

5364. Lit, Alfred & Vicars, William M. (Southern Illinois U.) *Stereocuity for oscillating targets exposed through apertures of various horizontal extents*. *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 348-352.—Assessed the separate effects of several interrelated temporal variables on binocular depth discrimination as measured in a 2-rod test apparatus. Equidistance settings were obtained from 2 highly trained undergraduates for a black target oscillating in a frontal plane at each of 5 velocities, and viewed against a constant illuminated background through 29 different horizontal apertures. Combinations of target velocities and aperture sizes were selected to produce a series of 8 constant target viewing times (.15, .25, .4, .5, .8, 1, 1.5, and 2 sec.). Both the constant and the variable errors of the equidistance settings were analyzed in terms of the relative deleterious effects produced by increased target velocity and reduced horizontal aperture. The deleterious effects are discussed with respect to the contribution of presumed loss in neural integration for the changing luminous-energy distribution patterns on each retina, energy losses occurring in each pair of stimulated binocular retinal elements along the path of image movement, decreases in target viewing time, and reduction in the number of binocular retinal elements being stimulated. (20 ref.)—*Journal abstract*.

5365. Mack, Arien & Chitayat, Deanna. (New School for Social Research) *Eye-dependent and disparity adaptation to opposite visual-field rotations*. *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 352-371.—Demonstrates eye-dependent perceptual adaptation and adaptation to altered retinal disparity in the absence of cyclotorsion. Os were exposed to a binocular prism system that produced 5°, opposite rotations to the 2 eyes. Tests of monocularly perceived vertical and of binocularly perceived stereovertical were administered before and after exposure. Results indicate simultaneous and opposite eye-dependent changes in the monocular perception of vertical, and adaptive binocular changes in the perception of stereovertical, such that 0 disparity evoked the experience of depth. Photographic measurements of cyclotorsion were made during testing to determine whether the adaptive changes were a function of oculomotor changes. No cyclotorsion was found. (26 ref.)—*Journal abstract*.

5366. Natadze, R. (Tbilisi State U., USSR) *O nekotorykh proyavleniyakh kategorial'nosti vospriyatiya*. [On some manifestations of the categorality of perception.] *Voprosy Psikhologii*, 1970(Jul), Vol. 16(4), 25-34.—Pairs of drawings of objects were presented tachistoscopically to Ss for size judgments. 1 of the objects in a pair was typically larger in nature than the other (e.g., umbrella and mushroom), but the size of the drawings was approximately the same. In all cases the drawing of the smaller object was perceived to be larger, even when objectively it was slightly smaller. When the same objects were presented in outline

drawings only so that they often were not identified, the relative size of the drawings was perceived correctly. The overestimation of the drawing of the smaller object occurred because Ss actually compared not the size of the drawings themselves but the size of representatives of specific object categories whose retinal images happened to be equal. The S's set, established by previous experience with objects, exercised its contrast effect and the drawing of the smaller object appeared larger. (English summary)—*L. Zusne*.

5367. Phillips, Richard J. (University Coll., London, England) **Stationary visual texture and the estimation of slant angle.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 389-397.—Examined the suggestion that a gradient of retinal stimulation from an irregularly textured surface is used in the estimation of slant. There are several measures that could form such a gradient. 8 pictures of slanting surfaces were constructed with the aid of a computer. These consisted only of texture elements: outline circles and ellipses. 12 undergraduates studied pairs of pictures and indicated which had the greater tilt. By varying separately the gradients of element size and element density, it was possible to show that only the former contributed appreciably to the impression of slant. Only some of the measures considered are consistent with this result. —*Journal abstract*.

5368. Reading, Rogers W. (Indiana U., Div. of Optometry) **The threshold of distance discrimination for objects located outside Panum's area.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Feb), Vol. 47(2), 99-105.—Measured thresholds of distance discrimination on 2 male 17 and 21 yr. old Ss by using an apparatus that presents the targets intermittently and asynchronously and monitors gross eye movements. The use of the method of constant stimuli makes possible stable measurements of depth discrimination for objects located as far away from the fixation point as 302.4 min. of arc.—*Journal abstract*.

5369. Vickers, D. (U. Adelaide, South Australia) **Evidence for an accumulator model of psychophysical discrimination.** *Ergonomics*, 1970(Jan), Vol. 13(1), 37-58.—Describes an accumulator model, in which sampled events may vary in magnitude as well as probability, and which can be developed to give a good account of much of the available data on psychophysical discrimination. 2 experiments are reported with 5 female 22-27 yr. old volunteers, in which S pressed 1 of 2 keys as soon as he had decided whether the longer of 2 simultaneously presented lines was on the left or right. Results are inconsistent with a runs or recruitment process, but accord well with predictions from the accumulator model. Other evidence consistent with such a mechanism is reviewed. (French & German summaries) (64 ref.)—*Journal abstract*.

5370. Wittenberg, Sidney; Brock, Frederick W., & Folsom, William C. **Effect of training on stereoscopic acuity.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Sep), Vol. 46(9), 645-653.—Attempted to determine if stereoscopic acuity can be improved by training. 16 20-29 yr. old Ss were measured with stereometric cards in a telebinocular and divided into a control and an experimental section. The latter underwent training in an instrument in which they repeatedly adjusted 1 virtual object to lie in the same fronto-parallel plane as another virtual object. Post-training retest showed that both groups had improved

performance. The experimental section demonstrated far greater improvement, a difference statistically significant at the .01 level, indicating that stereoscopic acuity had been improved by training.—*Journal abstract*.

Color Vision

Form & Pattern Discrimination

5371. Alluisi, Earl A. & Thurmond, John B. (U. Louisville) **Relative effects of figural noise and rotation on the visual perception of form.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 547-554.—48 undergraduates responded in a paper-and-pencil figure-cancellation task to 4 x 4 metric histoforms. Both random and constrained or Redundancy-I figures were used with both rotated and nonrotated noise-free choice figures, and with nonrotated choice figures perturbed by 12.5 and 25% visual cell noise. In terms of both the speed and accuracy of cancellation, perceptual performance with random figures was better than with constrained, and increases in visual noise produced monotonic decrements in performance. Although choice-figure rotation had no significant effect on accuracy, it produced decrements in speed equivalent to decrements that might be expected with nonrotated choice figures perturbed by 3.6 and 9.4% visual noise in the random and constrained-figure conditions, respectively. (17 ref.)—*Journal abstract*.

5372. Brown, Bill R. & Rebbin, Thomas J. (U. Louisville) **Simultaneous vs sequential discriminations of Markov-generated stimuli.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 353-357.—Required 48 undergraduates to make same-different classifications of Markov-generated histoforms that were distortions of 3 different prototypes. Task memory requirements were varied by presenting stimuli either simultaneously or sequentially for comparison, and the effects of shifts in memory requirements were also assessed. Classification performance in all cases was found to be superior under the simultaneous condition. Postshift performance was strictly a function of the mode of stimulus presentation following the shift, rather than the memory requirements present in the initial trials. Results, coupled with the observed relationships between performance and a measure of individual stimulus variability under the 2 memory conditions, strongly suggest that prototype encoding has limited relevance to performance in the same-different classification task used here.—*Journal abstract*.

5374. Corcoran, D. W. & Rouse, R. O. (Medical Research Council, Cambridge, England) **An aspect of perceptual organization involved in reading typed and handwritten words.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 526-530.—Reports 3 experiments of identical design, but using different basic materials. In Exp. I the probability of recognizing tachistoscopically presented typed and handwritten words was found: (a) when the 2 types of materials were presented in separate lists, and (b) when presented together in a mixed list when Ss did not know what type of material to expect next in the sequence. In

Exp. II, 2 handwritings were employed and in Exp. III, upper- and lowercase typed material was used. The mixed condition resulted in poorer performance than the unmixed condition only in Exp. I when typing and handwriting were used. In Exp. II and III, mixing had no effect. It is suggested that different recognition programs are used for typed and handwritten characters.—*Journal abstract.*

5375. **Donderi, Don & Case, Bruce.** (McGill U., Montreal, Quebec, Canada) **Parallel visual processing: Constant same-different decision latency with two to fourteen shapes.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 373-375.—Showed 14 high school and undergraduate Os 2, 5, 8, 11, or 14 geometric shapes at a 200-msec exposure. The maximum visual extent was the same for all numbers of shapes. The stimulus conditions were: all shapes identical, 1 shape different from the rest, and, for 5-14 shapes, 3 shapes different (4 shapes in all). The number of shapes, the condition, and the shapes used varied randomly through the sequence of 160 exposures. Decision latency to correct same or different response was independent of the number of shapes presented. Correct same and 3-different decisions were faster than 1-different decisions, but with 2 shapes different decisions were faster than same. Results suggest that same-different decisions are made with information processed in parallel from many stimuli.—*Journal abstract.*

5376. **Fudin, Robert.** (Long Island U.) **Letter structure factors in the recognition of alphabetical arrays presented in the right and left visual fields.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 555-559.—6-letter nonsense arrays made up of the letters H N Z D W J were tachistoscopically exposed either to the right or left of fixation at 4 displacements to 20 Ss. Structurally similar letters (i.e., H and N) tended to be recognized with greater difficulty than dissimilar items. The possible effect of letter structure was investigated separately in the 1st 1/2 of targets (letters 1, 2, and 3) and in the last 1/2. This effect was almost exclusively limited to the array half at each displacement which, because of its position in the visual field, fell in an area of greater visual acuity.—*Journal abstract.*

5377. **Houssliadas, L.** (U. Thessaloniki, Greece) **Perception of changes of form associated with phenomenal compression.** *Ergonomics*, 1970(Jan), Vol. 13(1), 67-72.—Describes visual stimuli associated with the perception of pressure or compression. It is suggested that (a) such experiences are mediated by specific changes of form of a stimulus in connection with the simultaneous movement of another stimulus; and (b) subjective factors are either ineffective or play a limited role. Experiments are reported which contribute to an understanding of conditions which determine our perception of causal relations. In this sense, the present study is an extension of A. Michotte's work on the perception of causality, which (a) describes a stimulus structure associated with experiences of compression which Michotte regarded as impossible to produce experimentally; and (b) shows that prior movement by the agent is not always essential for the perception of causal relations. (French & German summaries)—*Journal abstract.*

5378. **Ohera, Lubomir.** **On the problem of separability of some pattern recognition learning systems.** *Kybernetika*, 1969, Vol. 5(5), 420-436.—Investigates the separating capacity of a certain class of pattern recog-

nition learning systems. The systems learn from given labeled sample patterns in such a way that after the learning period is over all the given sample patterns are placed exactly to the same category in which they were labeled to belong. Estimations of the upper bound of the number of dichotomies separable by those systems are presented.—*Journal abstract.*

5379. **Thurmond, John B.** (U. Louisville) **Effects of discriminability and choice-figure rotation on visual perception of form.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 519-525.—Measured the effects on form perception of 2 conditions of rotation (provided by rotated and nonrotated choice figures) at different levels of discrimination difficulty. The stimuli were 6 × 6 constrained or Redundancy-I metric histoforms. 5 levels of discriminability were provided by use of different degrees of similarity between target and choice figures. In each of the 5 difficulty conditions, 24 undergraduates responded in a paper-and-pencil figure-cancellation task in both conditions of choice-figure rotation. Separate analyses of errors and response times indicate that perceptual performance with nonrotated choice figures was better than with rotated and that performance decreased as discrimination difficulty increased. In terms of the number of correct identifications/min, performance was proportional to discrimination difficulty and the detrimental effect of choice-figure rotation was constant over the levels of difficulty employed.—*Journal abstract.*

Eye Movement

5380. **Felipe, Abraham I. & Mahl, George F.** (U. Philippines, Manila) **Exploration of some mechanisms involved in blinking to visual sexual stimuli.** *Philippine Journal of Psychology*, 1969(Jun), Vol. 2(1), 25-30.—Tested the hypothesis that visual sexual stimuli would increase the rate of blinking and explored some possible mechanisms involved in the relationship between such stimuli and the blinking response. A conditioning experiment was run using 40 male undergraduates, 20 of whom were conditioned with the use of sex pictures and the rest with the use of landscape scenes as the UCS. An auditory stimulus was used as CS for 10 Ss of each group; a visual stimulus was used as CS for the remaining Ss. The sexual pictures elicited significantly more blinks than the landscapes, and both visual and auditory CS elicited more blinks when conditioned to the sexual pictures than when they were conditioned to the landscapes. The number of blinks elicited by the visual CS was not significantly different from that elicited by the auditory CS when both stimuli were conditioned to the sexual pictures. Results suggest that (a) the effect of the sexual pictures on arousal level is a critical factor in producing an increased blink rate, and (b) the sensory modality of the arousing stimulus is not critical. It is possible, however, that the latter might have only been due to the number of acquisition trials used.—*Journal abstract.*

5381. **Johnson, D. D. & Torok, N.** (U. Illinois, Medical School, Chicago) **Habituation of nystagmus and sensation of motion after rotation.** *Acta Otolaryngologica*, 1970(Mar), Vol. 69(3), 206-215.—Studied the habituation effect of repeated rotatory stimulation on 5 20-36 yr. old normal adults. A total of 20 identical rotatory stimulations were applied and the postrotatory nystagmus was registered by the photoelectric technique.

While Ss kept their eyes open in darkness, the frequency of the nystagmus was counted and no response decline was observed. On the contrary, some increase in the intensity of the postrotatory nystagmus was found. The perception of the sensation of motion following the sudden stop of a $180^\circ/\text{sec}$ angular velocity was also studied. Great variability was encountered but no consistent response decline occurred. The duration of the postrotatory nystagmus showed similar characteristics, i.e., variable responses but no signs of habituation. (German summary) (26 ref.)—*Journal abstract*.

5382. Khomskaya, E. D. & Denisovskii, G. M. (Moscow State U., USSR) *Individual'nye osobennosti makrodvizhenii glaz pri dlitel'noi smene tochek fiksatsii*. [Individual features of macromovements of the eyes with lengthy fixation.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 57-70.—11 Ss participated in a study of certain oculomotor parameters, amenable to some voluntary control: duration of fixation; speed and uniformity of shift in movement from 1 fixed point to another. Findings are detailed. All Ss were found capable of (a) adequate evaluation of the quality of their performance in attempting a "maximally rapid" movement, and (b) "correct establishment" for themselves of ocular displacement in such a way as to produce an "optimally rapid" movement (greater stability for the indices of frequency and uniformity of eye movements over a 5-min period).—J. D. London.

5383. Lenox, John R., Lange, Arthur F., & Graham, Kenneth R. (Stanford U., Lab. of Hypnosis Research) *Eye movement amplitudes in imagined pursuit of a pendulum with eyes closed*. *Psychophysiology*, 1970(May), Vol. 6(6), 773-777.—Prior claims that Ss imagining an oscillating pendulum with eyes closed can produce eye movements corresponding to those found when the S's eyes are actually pursuing the moving pendulum are refuted by using 12 undergraduates to show that the apparently smooth movements under imagination are not truly sinusoidal, and tend greatly to exceed the amplitude of the pendulum's excursion.—*Journal abstract*.

5385. Steinbach, Martin J. (York U., Downsview, Ontario, Canada) *Aligning the eye to the actively or passively positioned hand*. *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 287-288.—In a test of static alignment of the eye to the nonvisible fingertip, whether the hand was positioned by S or by E made no difference in the eye's consistency of localization of the fingertip. Ss were 5 male undergraduates. This result suggests that the outflow (efference) issued to move the arm was not supplying the oculomotor system with any more information about fingertip position than that already present from proprioceptive sources. It is consistent with earlier findings on tracking self-moved targets where useful information in the efferent signal was concerned with the self-moved target's acceleration and velocity changes rather than its position.—*Journal abstract*.

Brightness & Contrast Discrimination

5386. McDonnell, P. M. (U. New Brunswick, Fredericton, Canada) *The role of albedo and contrast in a test of selective attention*. *Perception & Psycho-*

physics, 1970(Nov), Vol. 8(5-A), 270-272.—Demonstrated the operation of a selective process under conditions that eliminated exploratory behavior, receptor adjustments, and that could not be construed as abstraction. 30 undergraduates were given a choice RT test to tachistoscopically exposed stimuli under 3 conditions of brightness and contrast. 4 targets equally spaced in brightness units were presented either on a black, a medium gray, or a white background. If a selective process was found to operate, it was hoped to separate the effects of albedo and contrast as factors determining priority in selection. Results confirm that Ss chose the stimuli of highest contrast, but in the event that contrast was equivalent for 2 stimuli, the target of highest albedo was chosen significantly more often. (17 ref.)—*Journal abstract*.

5387. Sperling, George. (Bell Telephone Lab., Murray Hill, N.J.) *Model of visual adaptation and contrast detection*. *Perception & Psychophysics*, 1970(Sep), Vol. 8(3), 143-157.—Proposed a 3-component model of spatial vision, consisting of a feedback stage, a feedforward stage, and a threshold detector. The components correspond to physiological processes; in particular, the feedforward control signal corresponds to the "surround's" signal in the receptive fields of retinal ganglion cells. The model makes appropriate qualitative predictions of: (a) a square-root law for detection at low luminances; (b) a Weber law at high luminances; (c) additivity of threshold masking effects at high background luminances; (d) receptive fields that, in the dark, consist only of an excitatory center and that, in the light, also contain inhibitory surrounds; (e) the variation of spatial characteristics of receptive fields depending on the temporal characteristic of the test stimulus used to measure them; (f) the subjective appearance of Mach bands; (g) sine-wave contrast-threshold transfer functions; (h) the frequent failure of disk-detection experiments to demonstrate inhibitory surrounds; and (i) various 2nd-order threshold effects, i.e., reduced spatial integration for long-duration stimuli, reduced temporal integration for large-area stimuli, and the increased effect of background luminance on the detection of large-area stimuli. Predictions are improved by assuming there exist various sizes of receptive fields that determine thresholds jointly. (41 ref.)—*Journal abstract*.

AUDITION

5388. Egger, G. J. & Ivinskis, A. (U. Newcastle, New South Wales, Australia) *An investigation into the development of melodic interval discrimination*. *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 187-191.—Used J. R. Trotter's melometer to investigate some proposals concerning melody discrimination. An analysis of covariance which controlled for scores on the Wing Test of Musical Intelligence shows that discrimination differed in artists ($N = 8$), professional musicians ($N = 8$), and students ($N = 8$). The significant difference between the groups indicates 3 levels of discrimination, 1 of which was attributed to musical training and the other to some underlying ability common to the fine arts. This finding was contrasted with some of Trotter's proposals, the method was evaluated and some possible limitations of the experiment given.—*Journal abstract*.

Perception

5391. Baekeland, Frederick & Hoy, Patrick. (State U. New York, Downstate Medical Center, Brooklyn) **Vigilance before and after sleep.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 583-586.—In an auditory vigilance (signal detection) task, 13 normal adult males missed more signals and made more false reports 10 min. after awakening in the morning than at night before bed. Higher confidence levels were associated with correct signal detections made before bed than with those made in the morning, and Ss were more confident when they responded to signals than when they made false reports.—*Journal abstract.*

5392. Cuddy, Lola L. (Queen's U., Kingston, Ontario, Canada) **Training the absolute identification of pitch.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 265-269.—Studied 2 methods for training the absolute judgment of pitch, and reference and series training. Reference training concentrated during training on the identification of 3 reference tones in a set of 9 pure tones, while series training gave equal weight during training to the identification of all 9 tones. Results of pre- and posttraining tests, scored for the number of correct judgments, show that reference training was more effective than series training for listeners with musical experience. In addition, discriminability scaling of pre- and posttest performance indicates that reference training was particularly effective for training listeners with musical experience ($N = 12$) when the 9 tones of a set were grouped into 3 pitch classes—high, medium, and low pitch. Listeners without musical experience ($N = 12$) benefited from both training methods, but their overall improvement was less than that for musical listeners. (25 ref.)—*Journal abstract.*

A. **O nekotorykh determinantskh sensomotornoi deyatel'nosti.** [On some determinants of sensorimotor activity.] *Voprosy Psikhologii*, 1970(Jul), Vol. 16(4), 47-55.—Studied auditory reception of Morse signals in 2 national champions in Morse signal reception by the ear. The signals were random sequences of letters and digits, varying in the number of symbols used (2-32 bits of information), length of blocks of identical signals, and speed of transmission. Errors in reception were measured in the typewritten script of the messages made by the operators. Contrary to Hick's law, the number of errors decreased with increasing information content of the messages. Increased speed of signal presentation affected sequences of low information content most. With $m = 8$, and increase from 90-220 signals/min had no effect on error rate. 2 important factors determined performance: presence of blocks of identical signals and auditory discriminability of signals. The type of error made by the operator depended on the size of the alphabet used in a message. The relationship of these factors to short-term memory and their interaction in determining performance is discussed. (English summary)—*L. Zusne.*

5394. Schulman, Arthur I. & Greenberg, Gordon Z. (U. Virginia) **Operating characteristics and a priori**

probability of the signal. *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 317-320.—2 experiments in auditory signal detection produced changes in the operating characteristic as the a priori probability of signal occurrence, $p(SN)$, was varied. The signal was a sinusoid of 1000 Hz. presented for 250 msec. against a continuous background of noise to 6 listeners. In Exp. I, 3 values of $p(SN)$ —.25, .50, and .75—were paired with each of 3 signal intensities. In Exp. II, the signal intensity was fixed and $p(SN)$ was assigned values of .10, .25, .50, .75, and .90. On normal-normal coordinates, operating characteristics were fitted to the points obtained from the 4-point rating scale used by Ss. Such operating characteristics may be specified by 2 parameters: d' , an index of detectability related to d' , and m , its slope. While d' was found to be independent of $p(SN)$, m was found to be a joint function of $p(SN)$ and signal intensity. Results are discussed against the background of the theory of signal detectability.—*Journal abstract.*

Speech Discrimination

5396. Hagness, Don E. (U. Illinois) **A preliminary investigation of the Modified Rhyme Test as a test of speech discrimination.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 945-946.

5397. Holloway, C. M. (Medical Research Council, Cambridge, England) **Consonant recognition with two levels of decision complexity.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 467-474.—Selected the particular items appearing in a message set to control precisely the number of dimensions relevant to the discrimination task, and estimated performance in terms of the discrimination of each relevant dimension. No evidence is found for a perceptual tuning effect even though it is argued that the conditions of the present experiment represent those most favorable for its elicitation. (18 ref.)—*Journal abstract.*

5398. Lushchikhina, I. M. (Leningrad State U., USSR) **Effektivnost' selektivnogo audirovaniya v rachevoi kommunikatsii.** [The efficiency of selective listening in verbal communications.] *Voprosy Psikhologii*, 1970(Jul), Vol. 16(4), 56-64.—Ss either repeated selectively verbal messages transmitted through headphones or executed commands so given. Messages varied in length and content, SPL, and length of intervals between messages. Results revealed 2 stages in selective listening: a lower stage in which simple physical discrimination of an incoming message occurred, and a higher stage in which identification of words and meanings occurred. If the regularities present in the lower stage were perceived, the 2nd stage took less time. Thus, it was more effective to present messages at a definite level of intensity. Still greater effect was achieved by enhancing the acoustical contrast between needed and unneeded messages. The grammatical structure of messages also had a definite effect on the receiver's performance. Informational analysis confirmed the hypothesis that stages in the discrimination of verbal communications differ in complexity. (English summary)—*L. Zusne.*

Audiometry

5399. Lidén, G. & Kankkunen, A. (U. Göteborg, Sahlgren's Hosp., Sweden) **Visual reinforcement audiometry.** *Acta Oto-Laryngologica*, 1969(Feb), Vol. 67(2-3), 281-292.—Describes visual reinforcement audiometry—a new technique for testing hearing in very young children and a modification and simplification of conditioned orientation reflex audiometry by T. Suzuki and Y. Ogiba. Instead of using the sound localization or eye deviation reflex as a response criterion, a non-directional technique was used and 4 different types of responses were accepted to the tone stimulation: reflexive behavior, investigatory, orientation, and spontaneous responses. Hearing levels of 120 normal hearing children of different age groups obtained with both methods are presented. (French & German summaries) (15 ref.)—*Journal abstract.*

5400. Scharf, B. & Fishken, D. (Northeastern U.) **Binaural summation of loudness: Reconsidered.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 374-379.—Measured loudness functions for a 1000-Hz tone and a white noise, presented monaurally and binaurally, by the methods of magnitude estimation and magnitude production. Results suggest that the ratio of binaural to monaural loudness for tone and noise is between 1.6 and 1.85 over an intensity range from 40- to 110-db SPL. Within this range, the ratio for white noise increases with SPL, but does not exceed 2. The loudness functions for monaural and binaural tones are power functions with the same exponent, whereas those for noise are not power functions but are bowed, on log-log coordinates, relative to the tone functions, being steeper below about 50-db SPL and flatter above. The loudness of binaural noise increases more rapidly with SPL than the loudness of monaural noise. (15 ref.)—*Journal abstract.*

CHEMICAL SENSES

5401. Pryor, Gordon T., Steinmetz, Gerald, & Stone, Herbert. (Stanford Research Inst., Life Sciences Div., Menlo Park, Calif.) **Changes in absolute detection threshold and in subjective intensity of supra-threshold stimuli during olfactory adaptation and recovery.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 331-335.—Studied olfactory adaptation and recovery to methyl isobutyl ketone at a concentration 10 times the absolute detection threshold in 2 human Ss. A combined psychophysical procedure was used that allowed comparisons of changes in threshold (I_1) with changes in the subjective intensity of supra-threshold stimuli. Information was also obtained on the effect of the adapting stimulus on the psychophysical power function for this odorant. A threshold detection procedure was used to estimate changes in I_1 ; an unstructured magnitude-estimation procedure was used to monitor changes in the subjective intensity of supra-threshold stimuli and the psychophysical power function. Results suggest an increase in the exponent of the power function with increasing adaptation.—*Journal abstract.*

5402. Steinmetz, Gerald; Pryor, Gordon T., & Stone, Herbert. (Stanford Research Inst., Life Sciences Div., Menlo Park, Calif.) **Olfactory adaptation and recovery in man as measured by two psychophysical techniques.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 327-330.—Investigated olfactory adaptation and

recovery in 4 male and 2 female adults using 2 psychophysical procedures: modified category scaling and threshold detection. Both procedures yielded similar qualitative information regarding loss and recovery of olfactory sensitivity as a function of time and concentration of adapting stimuli. However, quantitative differences were observed that could be partially attributed to artifacts inherent in each procedure. Often more than 50% adaptation (and recovery) occurred within the 1st 2 min. with either test procedure. In all experiments the rate of adaptation and recovery was greater at the higher of 2 adapting concentrations ($10 \times$ and $20 \times$ the detection threshold I_1). Recovery occurred more rapidly than adaptation. The usefulness of both techniques is discussed in terms of the overall problem of characterizing the olfactory adaptation and recovery process in man.—*Journal abstract.*

SOMESTHESIA

5403. Culver, Charles M. (Dartmouth Medical School) **Errors in tactile localization.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 420-427.—In a test of tactile localization, 75 17-18 yr. old undergraduate nursing students were lightly stimulated at points on their palm, and then indicated on outline drawings where they felt they had been stimulated. Both the amount and direction of localization error were measured. There was a slight tendency for all Ss to displace their judgments toward their thumbs. Left-handed Ss displaced their judgments in a wristward direction significantly more than did right-handed Ss. The overall amount of localization error was not related to hand or eye dominance but was significantly related to a measure of visual suppression.—*Journal abstract.*

5404. Diespecker, D. D. (U. Newcastle, New South Wales, Australia) **Short duration signals and learning a simple vibrotactile code.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 319-324.—20 male and 20 female undergraduates in 4 groups learned a 9-element vibrotactile code in which there were 3 intensities and 3 durations of signals. The durations of signals were varied over groups to determine whether at least 1 group of Ss would be unable to learn the code due to the brevity of the signals. There were no significant differences between the groups over 10 trials although durations ranged from 1, 3, and 5 sec. for Group 1 to .01, .18, and .36 sec. for Group 4. Data suggest that it may be possible to shorten signal durations in a practical vibrotactile communication system provided interstimulus intervals are carefully selected.—*Journal abstract.*

5405. Vierck, Charles J. & Jones, Marshall B. (U. Florida, Medical School, Div. of Neurosurgery) **Size discrimination on the skin.** *Science*, 1969(Jan), Vol. 163(3866), 488-489.—Tested the hypothesis that size discrimination would demonstrate a sensitivity that is not generally recognized for the skin senses in an experiment with 4 Ss. Reasons are given for rejecting the 2-point threshold as the standard measure of spatio-tactile resolution. As alternative techniques, thresholds were obtained for disc-size and disc-annulus discriminations. Disc-annulus thresholds are comparable to 2-point values, but disc-size thresholds are smaller by a factor of 10. Thus, at least part of the cutaneous system is better organized for localization and sizing of a stimulus than for detection of discontinuities in it.—*Journal abstract.*

ENVIRONMENTAL EFFECTS

5406. **Cahoon, Richard L.** (U.S. Army, Research Inst. of Environmental Medicine, Natick, Mass.) **Vigilance performance under hypoxia: II. Effect of work-rest schedule.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 619-626.—18 adult males performed a visual vigilance task for 2 hr. while breathing either 21% O₂ (sea level) or 10.9% O₂ (17,000 ft.). The 2-hr trial period contained either no rest periods, 1 10-min rest period, or 3 10-min rest periods. Vigilance performance deteriorated under 10.9% O₂, and the introduction of rest periods did not reduce this decrement. Of 2 individual difference measures taken, IQ and sensation-seeking score, only IQ related to vigilance performance and only at sea level (21% O₂).—*Journal abstract.*

SLEEP & FATIGUE & DREAMS

5407. **Aarons, Louis.** (Union U., Albany Medical Coll.) **Evoked sleep-talking.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 27-40.—Evidence for modifications of verbal behavior without awareness when awake, increased spontaneous sleep-speech by post-hypnotic suggestion, and discriminative motor responses during sleep suggested the possibility of induced/conditioned sleep-talking. 3 students with no history of sleep disturbance or talking were trained for a total of 8 nights with avoidance-escape conditioning to sleep talk. The administration of light and tone stimuli followed schedules based on sleep stage and time (continuous, variable and fixed interval), with Ss at first naive and later informed. Reinforcements of vocalization through reductions or elimination of stimuli were adjusted to maximize responding without awakening S. Responses varied from groans, sighs, and unintelligible mumbling to coherent speech with and without affective tone, related and unrelated to the experiment, and rich or stereotyped. Latency and frequency of sleep responses over successive nights may depend on the interaction of stimuli intensity levels with type of sleeper (light/deep). Avoidance vocalizations, behavioral and transient EEG awakening significantly decreased from Stage 1-4. Conditioning techniques may be feasible in the development of sleep-talking skills. (21 ref.)—*Journal abstract.*

5408. **Florica, Vincent, et al.** (FAA, Civil Aeromedical Inst., Physiology Lab., Oklahoma City, Okla.) **Physiological responses of men during sleep deprivation.** *FAA Office of Aviation Medicine Report*, 1970(May), No. 70-8, 16 p.—Studied 6 control and 6 sleep-deprived (84 hr.) Ss in pairs. Following the 1st sleep loss night, psychomotor performance ("Kugelmaschine") of sleep-deprived Ss was significantly below that of controls. However, urinary excretion patterns were similar for both groups and body temperature regulation was not affected.—*W. E. Collins.*

5409. **Phoebus, Eric; Taub, John M., Globus, Gordon G., & Drury, Robert.** (U. California, Irvine) **Sleep stage characteristics of extended sleep in normal Ss.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 526.—Studied the physiological patterns of sleep in 12 Ss following 2 normal nights of sleep (average 7.1 hr.) and 2 nights of extended sleep (average 9.1 hr.). On nights of extended sleep compared to nights of regular sleep, the Ss had significantly more sleep in Stage 2 ($p < .001$) and Stage REM ($p < .01$). The 2 sleep conditions did not differ significantly in Stage 1 or Stage 3-4. Results, and

other data on groups of Ss who habitually sleep for long or short durations, indicate that the amount of Stage 3-4 tends to be constant as total sleep time varies, and that with an increase in sleep length the increase in Stage 2 and Stage REM is independent of prior sleep habits of normal or long sleep.—*Author abstract.*

5410. **Webb, Wilse B. & Friel, Janette.** (U. Florida) **Characteristics of "natural" long and short sleepers: A preliminary report.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 63-66.—Compared the psychological, physiological, and intellectual characteristics of long and short sleepers among 1st-yr college students who indicated their typical sleep length on an entering questionnaire. 3 populations were obtained from follow-up interviews: 12 short sleepers, 10 continuing long sleepers, and 9 long-changed sleepers (originally long sleepers now sleeping less than 7½ hr/night). Data collected included a psychological test battery, college entrance scholastic scores, and physical examination statistics. Analysis comparing the 3 sleep-length groups on each measure yielded no statistical differences. It is concluded that in an achieving young adult population, self-selected extremes in sleep length do not appear to result in obvious adverse consequences.—*Journal abstract.*

HYPNOSIS & SUGGESTIBILITY

5411. **Broman, Harvey J.** (Emory U.) **The effects of stress and anxiety on suggestibility.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 910.

5412. **King, David J.** (State University Coll. New York, Oswego) **Note on suggestibility and clustering.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 316.—Administered the Harvard Group Scale of Hypnotic Susceptibility to 50 Ss. 1 mo. later Ss were used in a clustering study. "Correlations, computed between the suggestion measure and clustering, number-of-words, and categorical intrusions" were, respectively: .05, .14, and -.12. It is concluded that "suggestibility does not appear to relate to the various retention measures used in studies of recall of lists whose items belong to several categories."—*M. West.*

5413. **London, Perry & McDevitt, Ronald A.** (U. Southern California) **Effects of hypnotic susceptibility and training on responses to stress.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 336-348.—Studied performance and physiological responses to stress among 64 male undergraduates, of whom 32 were high in hypnotic susceptibility and 32 low, in 3 individual sessions, 1 unstressed and 2 under stress of cold and electric shock. Each session included 2 performance tasks, monitored on 8 physiological measures. Cold stress was produced by cooling an environmental control chamber to 35° F; shocks were randomly administered an average of 20 sec. apart. After the 1st 2 sessions (1 stressed, 1 unstressed) ½ of the Ss in each susceptibility group received 6 hr. of autohypnotic training in resisting stress and performing optimally. Hypnotic susceptibility critically influenced most of the dependent measures. High and low hypnotic susceptibles differ significantly on a number of performance and physiological parameters, and susceptibility frequently interacted with stress and training. Training was variably effective as a stress resistance technique. (38 ref.)—*Journal abstract.*

5414. **Spanos, Nicholas P.** (Boston U.) **A reply to**

Tellegen's "Comments on 'Barber's reconceptualization of hypnosis'." *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 268-269.—Responds to T. X. Barber's (see PA, Vol. 45:Issue 4) argument that T. X. Barber's attribution of circularity to the concept hypnosis is incorrect and that the hypnotic state constitutes a useful hypothetical construct for investigating the phenomena traditionally subsumed under the rubric hypnosis. However, an analysis of Tellegen's arguments concerning circularity indicates that they are based on erroneous assertions concerning hypnotic state theory and, therefore, do not constitute a challenge to Barber's contention. Although Tellegen may be correct in suggesting that hypnosis can be employed as a useful hypothetical construct, this remains to be demonstrated.—*Journal abstract*.

5415. Spanos, Nicholas P. (Boston U.) **Barber's reconceptualization of hypnosis: An evaluation of criticisms.** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 241-258.—Presents all criticisms leveled at T. X. Barber's theoretical and experimental endeavors and evaluates each criticism. It is concluded that Barber's reformulation of hypnosis capably withstands criticisms, and that special-state theorists have not as yet satisfactorily answered his challenge to their basic assumptions. (2 p. ref.)—*Journal abstract*.

5416. Tellegen, Auke. (U. Minnesota) **Some comments on Barber's "Reconceptualization" of hypnosis.** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 259-267.—Critically discusses T. X. Barber's assertions concerning the hypnotic-state construct and hypnotic research. The charge that hypnotic-state theories are circular and tautological is found unwarranted. Also, the fallibility of hypnotic indicators and induction techniques is considered no more reason for rejecting the hypnotic-state concept than for abandoning other well-established constructs. The empirically-based formulation is primarily methodological and appears not to be motivated. The value of Barber's contributions to a more rigorous and critical empiricism in the area of hypnosis is acknowledged.—*Journal abstract*.

MOTIVATION & EMOTION

5417. Gentry, William D. (Duke U., Medical Center) **Sex differences in the effects of frustration and attack on emotion and vascular processes.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 383-390.—Explored the effects of frustration (test-failure) and attack (insult) on mood, aggression, and vascular arousal in 30 male and 30 female undergraduates. Systolic and diastolic blood pressure were recorded prior to and immediately following provocation and Ss rated their feelings on a postexperimental mood questionnaire. Results indicate that both types of provocation led to increased vascular activity. Males evidenced a greater rise in systolic pressure than females; whereas, no sex differences were noted for diastolic changes. No differences were found between frustration and attack regarding their effect on vascular arousal. On the mood ratings, females tended to rate themselves as being weaker than males regardless of the treatment. Experimental females also reported more felt depression after being frustrated or attacked than did control females, a pattern of emotional response not shown by

male Ss. No differential effects were observed for aggression.—*Journal abstract*.

5418. Goldstein, Jeffrey H. (Temple U.) **Humor appreciation and time to respond.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 445-446.—Presented cartoons varying in content (nonsense, aggressive, sexual) and complexity (low, moderate, high) to 24 male undergraduates. Dependent variables included humor rating and time to respond to the cartoons. Within-cell correlation between these 2 variables was $-.288$. Response time was more affected by complexity of nontendentious than of tendentious humor.—*Journal abstract*.

5419. Greaves, George & Daves, Walter F. (Georgia State U.) **Effects of shock on performance in visual backward masking.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 534.—Attempted to determine if increased motivation would enhance information extraction in the metacontrast situation. 10 Ss were tested in a forced-choice discrimination task in which the targets (A, O, or blank) were masked by a ring. $\frac{1}{2}$ of the Ss were shocked for incorrect performance, and $\frac{1}{2}$ were not shocked. Masking was effective in both groups, and the shocked group performed more poorly under both masked and unmasked ($p < .001$) conditions.—*Author abstract*.

5421. Plot, James M. (Temple Buell Coll.) **Effect of threat of shock on pupillary response in a problem-solving situation.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 587-593.—Presented 2 groups of 7 18-19 yr. old undergraduates each with 2 series of 3 multiplication problems which served as the problem-solving task. On the 1st series of problems Ss were run under identical conditions to establish response base lines between groups. On the 2nd series of problems the experimental group was threatened with shock for an incorrect answer. Comparisons were made on response latency, correct responses, absolute pupil size, and pupillary dilation during problem solving. The only significant difference between groups was the degree of pupillary dilation while solving the 2nd series of problems. Results are discussed within the context of the coping process under the threat of stress and are related to previous research on the pupillary response as a measure of mental activity.—*Journal abstract*.

5422. Valueva, M. N. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Porogi obnaruzheniya zvukovykh signalov, sochetayemykh s bolevym razdrazheniem nablyudatelya ili ego partnera.** [Detection thresholds of acoustic signals combined with painful stimulation of the observer or his partner.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 714-715.—30 18-30 yr. old Ss (24 males, 6 females) participated in a study of the "features of neurophysiological mechanisms of complex forms of social motivation." A series of experiments was conducted where an acoustic signal preceded painful electrostimulation of the experimental O or, supposedly, of his experimental partner; such stimulation eventuating if the acoustic signal was not detected by the O. For the former, "fear for oneself" is involved; for the latter, "fear for the other person." Results show that, when personal escape from pain is the motive of activity

(signal detection), emotional tension is somewhat higher than when success in performance of the task (signal detection) precludes pain for the other person. Conversely, for the latter case, the level of attention is higher.—*I. D. London.*

5423. Wijting, Jan P., Wollack, Stephen, & Smith, Patricia C. (Bowling Green U.) **A factor analytic study of the subjective components of activation.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 635-640.—315 undergraduates cited personal examples of experiences involving high, moderate, and low levels of activation and described each of these experiences in terms of 132 adjectives and adjectival phrases. Data were subjected to varimax factor analyses: 12 interpretable high-, 9 moderate-, and 5 low-activation factors were extracted. The relevance of these results to activation theory and to G. Wolf's analysis is discussed.—*Journal abstract.*

5424. Wilson, Alan & Wilson, Arthur S. (Veterans Administration Center, Wood, Wis.) **Psychophysiological and learning correlates of anxiety and induced muscle relaxation.** *Psychophysiology*, 1970 (May), Vol. 6(6), 740-748.—Tested the hypothesis that muscle relaxation would reciprocally inhibit anxiety during a paired-associate learning task. Male general medical patients were divided into high, medium, and low anxiety levels and muscle tension, muscle relaxation, and normal tension groups. Paired-associate learning efficiency, as well as heart rate, skin conductance, integrated EMG, respiration rate, and finger temperature during learning were measured. Partial substantiation for the hypothesis was obtained for high anxiety Ss, but data for other groups are inconsistent with the hypothesis. An alternative explanation is suggested. Heart rate was the physiological variable which best discriminated the groups. (31 ref.)—*Journal abstract.*

ATTENTION & EXPECTANCY & SET

5425. Compton, J. William. (National Center for Mental Health Services, Training, & Research, Washington, D.C.) **Experimenter bias: Reaction time and types of expectancy information.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 159-168.—Each of 9 undergraduate male Es received general (personality and IQ), specific (expected performance), or no information about 136 female undergraduates. All information was fabricated. Ss' RT and photo-ratings were used to assess E-expectancy effects. Contrary to the findings of other investigators, Ss' photo-ratings were not significantly influenced by the specific expectancy of E, but their RTs were. Ss' photo-ratings and RTs were not significantly influenced by Es who received general information about their Ss.—*Journal abstract.*

5426. Davenport, W. G. (U. Newcastle, New South Wales, Australia) **Vigilance for simultaneous auditory and vibrotactile signals.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 159-165.—In a vigilance situation 9 male and 7 female undergraduates performed 3 separate 70-min watches, an auditory one (A), a vibrotactile one (C), and a simultaneous auditory-vibrotactile one (AC), to find if an improved detection rate might not be obtained by increasing the number of display channels to a single O. Results show that the AC channel had a significantly higher detection rate than either the A or C channels alone, the A channel being superior to the C channel. There was also a significant decrement over time for the A and C channels alone, but not for the AC channel. For both the A and C channels

alone there was a significant increase in Ss' thresholds over time. There was an insignificant increase for the AC channel. Paralleling these changes were large increases over time in Ss' criterion (β) for the A and C channels, and a small increase for the AC channel. The auditory and vibratory senses thus appear to be interdependent.—*Journal abstract.*

5427. Eriksen, Charles W. & Rohrbaugh, John W. (U. Illinois) **Some factors determining efficiency of selective attention.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 330-342.—Determined the efficiency of selective attention as a function of the number of elements in the display and the physical spacing between adjacent elements in 2 experiments. 6 paid undergraduates served as Ss in Exp. I and 4 in Exp. II. Results are interpreted in terms of an attentional focusing process.—*Journal abstract.*

5431. Sodhi, Surender S. (Memorial U., Newfoundland, St. John's, Canada) **Uznadze's set and second language learning.** *International Journal of Psychology*, 1969, Vol. 4(4), 317-319.—160 educational psychology students who had no French language background prior to high school, but who studied it during senior high school, were divided into good and poor 2nd-language learners on the basis of relationship of scores on the School and College Ability Test and the French form of the Cooperative Foreign Language Test. Trials needed for good and poor 2nd-language learners to acquire set fixation do not differ significantly. In extinction of set, the differences between means yield significance well beyond the .01 level. The latter result implies that poor 2nd-language learners exhibit the properties of a static set. Poor 2nd-language learners appear to shift from set to set with difficulty and are thereby hindered in learning a 2nd language. Results from other studies corroborate those found in the present investigation.—*S. E. Gavin.*

5432. Zelniker, Tamar. (Tel-Aviv U., Israel) **Perceptual attenuation of an irrelevant auditory verbal input as measured by an involuntary verbal response in a selective-attention task.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 52-56.—Delayed auditory feedback (DAF) normally causes

involuntary stuttering. If attenuation of irrelevant input occurs with selective attention, then a situation requiring Ss to attend to 1 auditory input, and ignore a 2nd consisting of DAF, will produce less stuttering than a situation including the same 2 inputs but in which selective attention is not required. 12 female undergraduates and 12 2nd grade boys repeated aloud digits delivered to their left ear and ignored the DAF of their own voice delivered to their right ear. Ss in both age groups stuttered less in a selective-attention than in a nonselective-attention condition. Results support the hypothesis that irrelevant input is attenuated where the stimuli presented to Ss exceed their processing ability.—*Journal abstract.*

MOTOR PERFORMANCE

5433. Critchley, E. M. (Preston Royal Infirmary, England) **Reversals in language: The importance of kinaesthetic feedback mechanisms.** *Journal of Learning Disabilities*, 1968(Dec), Vol. 1(12), 722-725.—Based on results from a prospective study of 53 high school students in 1st- and 2nd-yr typing classes and a study of errors made by typists taking part in world typing championships, the orthodox hypotheses relating reversals in language to developmental defects of visuospatial or temporal orientation are criticized. Results show that: (a) errors involving reversals and transpositions persist in typing beyond the learning period, (b) the tendency to reversals is not a universal attribute of the learning process of all language skills, and (c) transpositions are closely related to the accuracy of kinesthetic discrimination. It is concluded that the relationship of reversals and transpositions to schemata involving visuospatial "dysmaturity" has been overemphasized.—*M. Maney.*

5434. Federico, Pat A. (U.S. Air Force, Lowry AFB, Human Resources Lab., Colo.) **Some effects of inflating information feedback on the acquisition of a discrete lever-positioning response.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 447-459.—160 military trainees who were randomly placed into 4 equal groups were taught to displace a lever to an initial target by an error training procedure. Unknown to these Ss, the target position shifted; Ss were then trained to move the lever to this new target. During this phase of countertraining (CT), information feedback (IF) was inflated by different factors for each of the 3 experimental groups. The control group in this stage received the same unamplified IF which all groups were given during initial training. Ss receiving exaggerated IF neither engaged in more hunting behavior for the CT target, nor oscillated around it over and above those Ss not given misproportioned IF. Individual differences in responding were greater for the control group than any of the experimental groups. The 2nd 1/2 of countertraining for all groups was marked by a progressive deterioration in S-alignment. The most pronounced effects of IF distortion did not occur during the 1st CT trial as expected. All Ss approached at the same rate a common asymptote as a limit. There was an absence of any powerful tendency to persevere in moving to the initial target during countertraining. The cognitive relationship established by some of the groups between the IF- and R-scale did not differ, suggesting that some of the transformations adopted were psychologically meaningless.—*Journal abstract.*

5435. Holt, Laurence E., Travis, Thomas M., & Okita, Ted. (Dalhousie U., Halifax, Nova Scotia, Canada)

Comparative study of three stretching techniques. *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 611-616.—Compared 3 techniques for increasing range of motion—fast stretch (ballistic), slow stretch, and isometric contraction of the agonist (IA), followed by a concentric contraction of the antagonist (CA), a modified version of proprioceptive neuromuscular facilitation—using 24 normal male Ss. Controlling for serial order effects, 6 groups of 4 Ss each were administered the treatments, and the differences between pre- and postexercise measures were observed. Multiple regression analysis indicates the superiority of the IA-CA approach.—*Journal abstract.*

5436. Iskander, Amin & Rutenfranz, Joseph. (Justus Liebig U., Max Planck Inst., Giessen, W. Germany) **Zum Problem Lohnender Pausen beim Erlernen einer Spurverfolgungs-Tracking-Aufgabe.** [Motivation pauses in tracking tasks.] *Studia Psychologica*, 1970, Vol. 12(2), 134-146.—Experiments on the effect of pauses on training in tracking on rotary equipment have shown training with pauses to be superior to that without pauses. This has also been found in experiments with O. Graf's driving simulator according to the principle of tracking. Other studies indicate that performance improves with the length of the pauses between individual training periods. The pause-induced increments in performance grow exponentially with the length of the pause; however, the effect of the pause declines in proportion to the length. Achievements in training sensorimotor skills are determined by the initial improvement in training. An average initial achievement does not permit a prediction of the expected performance, although this is possible in extreme groups whose initial achievement is either above, or below average. (Czech & Russian summaries) (31 ref.)—*English summary.*

5437. Marteniuk, Ronald G. & Wenger, Howard A. (U. British Columbia, Vancouver, Canada) **Facilitation of pursuit rotor learning by induced stress.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 471-477.—12 female and 18 male right-handed undergraduates practiced the pursuit rotor task over 2 days. 20 distributed trials were given on Day 1, and 10 further distributed trials 24 hr. later. Ss were randomly assigned to 3 groups: a related arousal, an unrelated arousal, and a control group. Arousal was increased by application of electric shock during Trials 6-15 on Day 1. The related arousal group were told they would be shocked if their performance did not reach an established criterion while the unrelated arousal group received random and unavoidable shock. Results show that performance in the 2 stress conditions was not different from that of a control group. However, when tested 24 hr. later, both stress groups demonstrated significant ($p < .05$) improvements in learning over the control group but no difference between themselves.—*Journal abstract.*

5438. Noble, Clyde E. (U. Georgia) **Acquisition of pursuit tracking skill under extended training as a joint function of sex and initial ability.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 360-373.—Trained 256 male and 244 female undergraduates of Caucasian ancestry on the United States Air Force Rotary Pursuit apparatus for 100 20-sec trials spaced by 10-sec rests. Results show that: (a) mathematical forms of the percentage time-on-target curves were independent of aptitude; (b) curves at 5 ability levels were exponential and highly predictable (average error <

0.3%); (c) significant trend differences revealed early divergence and later convergence; (d) initial ability, acquisition rate, and final level were positively correlated; (e) no significant age differences were found within the range of 17-41 yr.; (f) men were superior to women in tracking skill (more accurate, less variable), maintaining an average lead of about 7.8% time on target; (g) interactions with practice were found between aptitude and sex; (h) intratrial σ^2 values rose rapidly to a peak, then fell gradually with training; (i) intertrial γ values decreased (based on Block 1) from Blocks 2-20 and increased (based on Block 20) from Blocks 1-19; and (j) differentiation between Ss of low and high aptitude was maintained at advanced levels of proficiency ($\gamma > .50$) despite the decreasing intertrial γ pattern. (33 ref.)—*Journal abstract*.

5439. Smith, Leon E. (U. Iowa) **Speed of muscular contraction.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 171-176.—Individual differences between concentric forearm strength of 27 male undergraduates and concentric movement time (MT), eccentric MT, and strength contraction MT were found to be low. The speed to contract skeletal muscle is influenced by muscle length and the degree and type of contraction. Concentric forearm speed was more rapid than eccentric speed of movement. (15 ref.)—*Journal abstract*.

5440. Thomas, Ewart A. & Jones, Richard G. (U. Michigan) **A model for subjective grouping in type-writing.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 353-367.—Describes an experiment in typing in which the visual spacing in the text and the amount of linguistic structure in the material are varied. Results show that average typing speed is decreased both by removing visual spaces from the text and by decreasing the amount of structure in the material. Data are interpreted as evidence that there is response grouping in a typist's output, and a model is stated in which this grouping is attributed to the operation of a response-unit scanner. More detailed analysis by means of this model suggests a picture of serial and parallel information processing to be an adequate representation of the conversion of text into type.—*Journal abstract*.

5441. Weingarten, Gilad & Alexander, John F. **Effects of physical exertion on mental performance of college males of different physical fitness level.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 371-378.—Administered 2 mental tests to 13 physically fit and 9 less fit male undergraduates. Test 1 consisted of the 30 odd-numbered matrices from the Standard Progressive Matrices and Test 2 of the 30 even-numbered ones. Throughout Test 1 Ss performed a physiologically moderate work level on a treadmill and throughout Test 2 a physiologically unduly heavy work level. The cardiovascular responses indicate a significantly higher exertion level in the less fit group during Test 2. Between group differences on test scores and time taken for test completion were insignificant on Test 1 but significant on Test 2, the fit Ss scoring higher and taking longer time. Within-group comparisons indicate that the fit Ss scored the same on both mental tests but took longer time for Test 2, whereas the less fit scored significantly lower on Test 2, taking shorter time for its completion. (25 ref.)—*Journal abstract*.

REACTION TIME

5442. Biederman, Irving & Kaplan, Robert. (State U.

New York, Buffalo) **Stimulus discriminability and S-R compatibility: Evidence for independent effects in choice reaction time.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 434-439.—In contrast to flexible capacity theories of information-processing behavior, discrete stage models generally assume that the functioning of 1 stage (e.g., stimulus discrimination) proceeds independently of the demands on some other stage (e.g., response selection). These alternatives were tested by factorially varying stimulus similarity and stimulus-response compatibility in a speeded brightness discrimination task with 16 adult Ss. The independent stage hypothesis was supported by the finding that, in general, the experimental variables did not have interactive effects on the means and higher order cumulants of the RT distributions. Some evidence, however, was found for weak interactive effects in the 1st of 2 sessions.—*Journal abstract*.

5443. Dimond, Stuart. (University Coll., Cardiff, Wales) **Reaction times and response competition between the right and left hands.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 513-520.—Interspersed in a series of signals for either right or the left hand response were a number of double signals which called simultaneously for response from both hands. Both the right and the left hands had an equal chance of taking precedence over the other, and an equal chance that their response would be delayed. The hand controlled by the dominant hemisphere responded 1st no more often than did the nondominant one. A degree of synchrony developed between the responses of the hands as the Ss experienced a greater number of signals for paired response. In Exp. II the hands were required to compete with one another after practice had been given in responding with only 1 hand. The effects of practice were not equal and opposite across the body. Practiced left hand responses were found not to be disturbed by the addition of a simultaneous signal for another response, whereas right hand responses were. This relationship exists in both right- and left-handed Ss, and results indicate differences in cerebral control between the hemispheres related not to handedness but to side of the body as such.—*Journal abstract*.

5444. Thornton, Jerry W. & Jacobs, Paul D. (U. Oklahoma) **Analysis of task difficulty under varying conditions of induced stress.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 343-348.—Examined 2 tasks (simple and choice RT) while varying 3 types of stressors (shock, threat of shock, and noise) and the stressor task relationship (i.e., task-related stress, task-unrelated stress, and no-stress). Ss were 36 undergraduates. 4 hypotheses were tested and 3 were supported in the simple RT task. There were no significant differences among stressors for either task, although greater differences were reported in the simple than in the choice RT task. A significant difference between the task-relatedness of stress levels in the simple task was interpreted as possibly due to a coping or protective adaptive mechanism in which increases in performance serve to reduce stress. Practical applications are examined.—*Journal abstract*.

LEARNING

5445. Berman, Marilyn; Fraser, Malcolm P., & Theios,

John. (U. Wisconsin) Learning a general maximum likelihood decision strategy. *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 393-397.—Displayed sequences of 25 uncertain binary events to 3 male and 6 female undergraduate and graduate students. The 1st i events were generated with probabilities p_1 and $1-p_1$. The remaining 25-i events were generated with probabilities p_2 and $1-p_2$. Ss estimated the point in the stimulus sequence where the probabilities changed. Ss were given 200 problems (sequences)/day for 17 days in 1 of 3 feedback conditions: true transition point, maximum likelihood estimate of transition, or both types of information. The p_1 , p_2 , and i for each problem were selected at random from uniform distributions. There were systematic feedback effects such that Ss' performance improved considerably under all the feedback conditions, but the performance of the dual and maximum likelihood feedback groups was better than that of the true feedback group. The behavior of the dual feedback group approximated that of the optimal maximum likelihood decision strategy. In all conditions, the proportion of exact detections of both the true transition and the maximum likelihood estimate increased with both the absolute difference between the 2 probability values and the absolute difference between the expected variances of the 2 components of the stimulus sequence.—*Journal abstract*.

5449. **Krasnoff, Alan & Boswell, John J. (U. Missouri, St. Louis) Two modes of generalization: A comparison.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 367-371.—64 undergraduates performed 2 independent generalization tasks to determine whether Ss who produced error responses on 1 task would produce error responses on the other task. Results show a significant intertask correlation but are insufficient to support individual case prediction.—*Journal abstract*.

5450. **Lumsden, J. (U. Western Australia, Nedlands) A critical comment on the Davenport and Halford RRT experiments.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 193-194.—Argues that W. G. Davenport and G. S. Halford's (see PA, Vol. 42:1677) and G. S. Halford and W. G. Davenport's (see PA, Vol.

45:Issue 4) claim that their results from a paired-associates task with a stimulus complex and 2 successive test trials to be inconsistent with the incremental learning theory is incorrect. It is suggested that the version of the incremental theory which they consider is not that of any advocate of incremental learning and seems to have been invented by Estes for polemical purposes. It is concluded that "if anything, the results put all-or-none [AON] theory under strain." A reply by W. G. Davenport and G. S. Halford follows in which it is agreed that they "have not demonstrated that an incremental view of learning is not empirically feasible." However, it is argued that "the several tests for AON learning used did not give results which are prima facie consistent with AON learning, but can be reconciled with incremental learning only if additional assumptions are made."—M. Maney.

5451. **Petrich, Judith A. (U. Pittsburgh) R-S unlearning as a function of degree of S-R unlearning.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 125-127.—Tested the hypothesis that unlearning is bidirectional and asymmetrical in an experiment with 96 undergraduates, in 6 conditions. In the experimental conditions, the A-B, A-C paradigm was employed, with A-C learning consisting of 16 trials on a single list in Condition E-1 and of 4 trials on each of 4 lists in Condition E-4. A retroactive-inhibition control condition was also included in the study. $\frac{1}{2}$ of the Ss in each condition were tested for A-B recall in Stage 3, and the other $\frac{1}{2}$ were tested for B-A recall by an unpaced modified free recall test. Results indicate that Conditions E-1 and E-4 both produced significant unlearning of A-B and that Condition E-4 produced a significantly greater decrement in A-B recall than Condition E-1. However, neither condition produced significant unlearning of B-A. Data suggest that unlearning is a unidirectional process.—*Journal abstract*.

Conditioning

5452. **Harvey, Brian & Wickens, Delos D. (Ohio State U.) Effect of instructions on responsiveness to the CS and to the UCS in GSR conditioning.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 98(1), 137-140.—Investigates a possible basis for the effect of differing instructions upon conditioned GSR magnitude, an effect which has been reported both by F. A. Hill (see PA, Vol. 41:5453) and by M. E. Dawson and P. Reardon (see PA, Vol. 44:3115). The experiment essentially repeats the procedures of these studies except that trials to the UCS alone were interpolated during conditioning and during extinction. 4 groups of 25 female undergraduates each were run, 2 with preconditioning instructions and 2 with anticonditioning instructions. The interstimulus interval was 500 msec. for 1 pair and 2000 msec. for the other pair. Results 1st corroborate the 2 earlier experiments, with the preconditioning groups showing greater response magnitude to the CS alone than did the anticonditioning groups. However, the same effect was found for the UCS-alone trials. This latter result suggests that the superior conditioning of the Pro group may be due to the nonassociative variable of UCR magnitude rather than an associative hookup factor.—*Journal abstract*.

5453. **Levis, Donald J. (U. Iowa) Effects of serial CS presentation on a finger-withdrawal avoidance response to shock.** *Journal of Experimental Psychology*,

1971(Jan), Vol. 87(1), 71-77.—Exp. I with 110 male undergraduates, compared the performance of 2 serial (S, followed by S₂) and 2 nonserial CS conditions on a finger-withdrawal avoidance response. The CS-UCS interval was 800 msec. Light served as the CS and shock served as the UCS. Nonserial CS conditions produced faster response latencies and more responding than serial CS conditions. Exp. II provided data suggesting that the differences noted in Exp. I were a function of the length of the CS-UCS interval employed. Shorter intervals (300 and 600 msec.) eliminated the latency difference between conditions, while a longer interval (1200 msec.) increased it. Possible interpretations of the data are discussed.—*Journal abstract.*

5454. Morrow, M. C., Seiffert, P. D., & Kramer, Lorr L. (Georgia State U.) **GSR conditioning and pseudoconditioning with prolonged practice.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 39-44.—Gave 2 groups of 14 undergraduate Ss each 16 conditioning or pseudoconditioning trials/day for 5 days. The compound (light-tone) CS was paired with a 3.5-ma electric shock (interstimulus interval = .5 sec.) in the conditioning group but the stimuli were not paired in the pseudoconditioning group. On Day 6 both groups received 2 counterbalanced CS-element test trials and then 18 CS-compound extinction trials. During acquisition, the conditioning group produced significantly larger GSRs over-all than the pseudoconditioning group, and the former's responses generally increased over test trials on each day while the latter's responses declined. There was an over-all decrease in GSR magnitude overnight in the conditioning group and an over-all rise in the pseudoconditioning group. The GSR was significantly smaller in the conditioning group on the 1st element test trial than it was on the 1st compound trial on Day 5, but it was not significantly different from the final compound trial on Day 5, or from the mean of the 1st 2 compound trials on Day 6. There was a sustained, statistically significant difference in mean magnitude between the 2 groups across the extinction trials with very little evidence of any extinction effects.—*Journal abstract.*

(George Washington U.) **Conditioning the pupillary reflex with control for the orienting response.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 643-646.—Attempted to achieve conditioning of the pupillary reflex under conditions designed to limit the effects of the orienting response. Data were obtained for 14 undergraduates who observed a series of lights of 4 colors, each presented 30 times for

7.5 sec. in random order. A mild electric shock was paired with 1 of the colors during the middle 3rd of the experiment. Comparisons of pupil diameters during various stages of the study show a significant level of conditioning.—*Journal abstract.*

Verbal Learning

5458. Cramer, Phebe. (U. California, Berkeley) **Magnitude and selectivity as independent factors in semantic generalization.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 509-524.—4 experiments investigated the effect of modifying the arousal of implicit associative responses (IARs) during training on producing subsequent changes in the magnitude and selectivity of IAR-mediated generalization. Ss were 26, 28, 29, 27, and 39 undergraduates. Results indicate that training procedures which require the S to focus on the critical stimuli (CSs) increase correct CS recognition, but decrease the overall magnitude of mediated generalization. Selectivity of the generalization effect was shown to be a function of time allowed for IAR occurrence during training. In all conditions, priming was effective in modifying specific IAR arousal. Results were replicated in a 5th experiment. (17 ref.)—*Journal abstract.*

5459. Kausler, Donald H., Erber, Joan T., & Olson, Gayle A. (St. Louis U.) **Taxonomic instances as right or wrong items and selection strategies in verbal-discrimination learning.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 428-435.—Instances of a single taxonomic category served as either the right (R) or wrong (W) items of a verbal-discrimination list. 60 undergraduates served as Ss. Relative to a control condition having unrelated items on the list, learning was markedly accelerated when the instances were R items, but it was only slightly accelerated when the instances were W items. Additional evidence provided by the free recall of R and W items support the conclusion that a general selection strategy mediated the verbal-discrimination learning only when the positive instances defining class membership occurred as R items.—*Journal abstract.*

5460. King, David J. (State University Coll. New York, Oswego) **Influence of interitem interval in the learning of connected discourse.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 132-134.—Evaluated the total-time hypothesis where the learning material consisted of connected discourse. A total of 560 undergraduates were randomly distributed into a 7 × 2 × 2 × 4 design. The dimensions of the design represented 7 lengths of learning material, sex, 2 lists, and 4 interitem intervals. Results do not support the total-time hypothesis.—*Journal abstract.*

5461. Lippman, Louis G. (Western Washington State Coll.) **Serial isolation effect as related to list-end demarcation.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 135-137.—Ends of a 12-CVC serial list were either demarcated (ITI) or disguised (no ITI plus extralist items preceding the 1st item on the 1st trial only), and the 7th item was either isolated or nonisolated. Ss were 80 undergraduates. Differential performance at the locus of the isolated item supported an interpretation that in a list having a disguised starting point, the isolated item functions as a starting point for the series.—*Journal abstract.*

5462. Miller, Adam & McCrimmon, Russell. (St.

Cloud State Coll.) **Stimulus and response variations in learning artificial linguistic systems.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 215-222.—Studied in 2 experiments with undergraduates the learning and reproduction of simple, artificial linguistic systems. In Exp. I, the nature of the stimuli and responses did not affect learning efficiency for 45 Ss, but the arrangement of associations between stimulus characteristics and response parts did affect learning efficiency of a main system and the reproduction of a subsystem after learning. In Exp. II the overlap in stimulus characteristics for adjacent stimuli facilitated learning for 40 Ss. Stimulus-response explanations of results were adequate to account for the relationships reported and relied upon the concept of learning sets for language structure.—*Journal abstract.*

5463. Mueller, John H. & Pickering, James P. (U. Missouri) **Correction procedures in three-alternative verbal-discrimination lists with intertrial associations.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 401-411.—Varied intertrial associative relationships in 3-alternative verbal-discrimination lists, using either specific correction (the word itself) or outcome correction (right, wrong) with a 2×4 factorial. 5 male and 5 female undergraduates served as Ss. All of the associative lists were learned faster with outcome-correction feedback than was the control list, in which there were no interpair associates (NA list); but with specific-correction feedback, only the list in which both associates were right (AR list) was learned faster. The facilitation with outcome correction is attributed to a change in the chance level of guessing for the lists in which both associates were wrong (AW list) or in which the associates were both right and wrong in different pairs (AB list), and to a summation of rehearsal and implicit response in the AR list. The failure to find interference with specific correction for the AW and AB lists resulted from the ceiling effect that occurred because of the slow presentation rates.—*Journal abstract.*

5464. Nelson, Douglas L., Wheeler, Joseph, & Bercov, Steven. (U. South Florida) **Variations in item availability and distinctiveness and the role of temporal constancy cues in serial anticipation.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 463-464.—Manipulated high and low meaningfulness and formal similarity within a serial anticipation task with 128 undergraduates under conditions in which temporal constancy cues were, or were not, eliminated. Findings suggest that as item availability and distinctiveness decreased, there was a proportionally greater reliance upon the retrieval cues associated with constant temporal position. When meaningfulness was low and similarity high, 75% of Ss showed little or no progress in learning the list, even after 100 trials, if the temporal constancy cues were eliminated.—*Journal abstract.*

5465. Oakes, William F. (City Coll., Graduate Center, City U. New York) **On awareness in verbal operant conditioning and discrepant results.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 274.—Contends that findings by S. L. Mandel and L. D. Goodstein (see PA, Vol. 44:4487) do not "contrast sharply" with previous findings that color naming between trials has no significant bearing on performance.—*M. West.*

5467. Šípoš, Ivan. (Slovak Academy of Sciences, Bratislava, Czechoslovakia) **Verbálne podnety ako experimentálne premenné veličiny.** [Verbal stimuli as experimental variables.] *Studia Psychologica*, 1970, Vol. 12(3), 188-213.—Summarizes a series of experiments with verbal stimuli. In Exp. I Ss rated expressions of, e.g., frequency, and quality, on a numerical scale. According to the character of response distribution, semantically definite and indefinite words were ascertained which involved various forms of uncertainty. Exp. II describes a similar analysis of some expressions from Eysenck's Maudsley Medical Questionnaire. Exp. III deals with interval scales of monodimensional semantic continua set up with the aid of the method of successive intervals. Exp. IV investigated the RT to color naming, coded in view of S's (verbal) response by means of words of high and low verbal frequency. In general, high-frequency words enabled a prompter response than low-frequency words. Exp. IV followed recognition of 40 in a group of 160 words, matched for word frequency, grammatical categories, and combination of memory in- and output: vision-vision, vision-hearing, hearing-vision, and hearing-hearing. Performance was not significantly affected by the character of in- and output. An analysis of dispersion, however, indicates a significant difference in regard to word frequency, and this in favor of low-frequency words. Likewise, nouns were remembered best. In recognition, the quality of performance declined as a function of time. Results confirm that the verbal signal in any experimental work in psychology is a variable which requires analysis. (Russian summary) (39 ref.)—*English summary.*

5468. Smith, Sandra & Jensen, Larry. (U. Calgary, Alberta, Canada) **Test of the frequency theory of verbal discrimination learning.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 46-51.—Prior to verbal discrimination (VD) learning, 72 undergraduates pronounced the items in the list. $\frac{1}{3}$ practiced only the correct items, $\frac{1}{3}$ the incorrect, and $\frac{1}{3}$ both correct and incorrect items. $\frac{1}{2}$ of the Ss were told which items would be correct, and $\frac{1}{2}$ were uninformed. The frequency theory of VD learning predicts that Ss practicing the correct item would perform best on the subsequent VD learning. Ss practicing both items should initially make the most errors, but should then improve faster and finally excel Ss practicing only incorrect items. Information about which item would be correct should have no effect. Results support the predictions. Information did not facilitate performance except on the 1st trial.—*Journal abstract.*

5469. Wollen, Keith A., Fox, Robert A., & Lowry, Douglas H. (Washington State U.) **Variations in asymmetry as a function of degree of forward learning.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 416-419.—Hypothesized that associative symmetry would obtain when forward learning was either low or high, whereas asymmetry would occur when forward learning was intermediate. Forward and backward recall for 80 undergraduates were compared on a trial-by-trial basis throughout the entire course of paired-associate learning. The design included factorial combinations of noun imagery (high vs. low) and testing direction (forward vs. backward). The procedure involved study trials in the forward direction alternating with tests which were always in the backward direction (for the backward condition) or always in the forward direction (for the forward condition). Training was taken

to the criterion of 1 perfect trial. For both low and high imagery, the difference between forward and backward curves increased from near 0 when forward learning was low, to a maximum when forward learning was 77% complete, and then back to 0 as forward learning neared 100%. Data provide an interpretation of why some Es found associative symmetry, whereas others did not.—*Journal abstract.*

Verbal Paired Associate Learning

5470. Birnbaum, Isabel M. (U. California, Irvine) **Recall of a word list after interpolated reading.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 412-419.—Investigated the effects of natural language activity on the retention of a word list with 68 undergraduates. After learning a paired-associate list of high-frequency words, Ss in a control group engaged in a pattern-selection task while Ss in 3 experimental groups read descriptive materials. $\frac{1}{2}$ of the words from the list were embedded in the reading material. Accuracy and latency of recall of the word list was measured 21 min. after the end of original learning. There was no difference between groups in the number of words correctly recalled; in all 3 experimental groups, however, there was a significant increase in the latency of recall of responses only for pairs which had been embedded in the interpolated reading material. It is concluded that natural language activity can have specific interfering effects on the recall of a word list.—*Journal abstract.*

5471. Bower, Gordon H. (Stanford U.) **Imagery as a relational organizer in associative learning.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 529-533.—Mental imagery improves paired-associate (PA) learning relative to overt rehearsal. The effect might be due to increased reliability of stimulus encoding or to increased relational association produced by imagery. These hypotheses expect different outcomes when imagery and rote-rehearsal Ss are compared on memory tests of stimulus recognition and on recall of the response term conditional upon stimulus recognition. 30 high school graduates learned PAs using 1 of 3 methods—rote repetition, interactive imagery, or separation imagery. Associative recall was highest for interactive-imagery Ss and lower and equal for rote- and separation-imagery Ss. No differences in stimulus recognition appeared. Evidence supports the relational-organizing interpretation of the PA effect of imagery in opposition to the stimulus-distinctiveness or reliable-encoding explanations.—*Journal abstract.*

5472. Duffy, Thomas M. (U. Illinois) **Mnemonics and intralist interference in paired-associate learning.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 927.

5473. Houston, John P. (U. California, Los Angeles) **Effects of audiences upon learning and retention.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 449-453.—72 male undergraduates learned either an A-B or successive A-B, A-C paired-associate lists. The A-B list was always learned alone, while the A-C list was learned either alone or in the presence of a passive audience of 2. In support of R. B. Zajonc's drive interpretation of the effects of audiences, and in contrast to the prediction based upon a distraction interpretation, the presence of an audience during 2nd-list learning resulted in a reduction in retroactive inhibition. Exp. II with 80 male undergraduates suggested that the effects obtained in Exp. I could not be accounted for in terms of

the functional cue properties of the audience.—*Journal abstract.*

5474. Levin, Irwin P., Williams, Jeral R., Dulberg, Corinne S., & Norman, Kent L. (U. Iowa) **Performance in a verbal transfer task as a function of preshift and postshift response dominance levels and method of presentation.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 469-471.—Investigated some effects of response dominance level (defined by free association norms) on paired-associate learning and transfer in 2 experiments with 64 undergraduates each. The experiments differed in terms of the manner in which the stimuli and response alternatives were presented, including both recall and recognition procedures, and in the use of a within-Ss vs. a between-Ss manipulation of pre- and postshift response dominance levels. Ss consistently made fewer errors when the response to be learned (either pre- or postshift) was high in dominance level than when it was low, indicating the generality of previous findings. Differences between the experiments in regard to the effects of preshift response dominance level on postshift performance and in the incidence of overt intrusions of the preshift response on postshift trials are discussed.—*Journal abstract.*

5475. Martin, Edwin & Mackay, Stephen A. (U. Michigan) **A test of the list-differentiation hypothesis.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 311-321.—Tested the idea that original and interpolated paired-associate learning in a negative transfer paradigm produce list-differentiated response sets by cluster analyzing unstimulated, freely recalled responses. 48 female undergraduates served as Ss. List-determined recall organization failed to occur both in immediate and in delayed recall under the stimulus-response (S-R) interference paradigm (S₁-R₁, S₂-R₂) but did occur under the control paradigm (S₁-R₁, S₂-R₂).—*Journal abstract.*

5476. Osborne, Francis H. (Syracuse U.) **The effect of intralist response similarity and response meaningfulness on transfer under the A-B, A-Br paradigm.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 419-420.

5477. Runquist, Willard N. & Blackmore, David. (U. Alberta, Edmonton, Canada) **Individual differences in interference from stimulus similarity.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 141-143.—6 high school Ss learned 55 6-item paired-associate lists in which the stimuli shared 0, 1, or 2 letters in the same position for all items of a list. There were 7 different similarity relations with S learning 6, 0 lists on Day 1 and 1 list exemplifying each relation on each of 7 days thereafter. Consistent with previous studies, most Ss showed decrements in performance as number of identical letters increased, but no consistent effect of position. The magnitude of the effect decreased over days, but was still present at the termination of the experiment.—*Journal abstract.*

Reinforcement

5478. Berman, Mark L. (Pennsylvania State U.) **Effects of response cost and reinforcement magnitude on performance on programmed materials.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 17-18.—Manipulated response cost and reinforcement systematically over a range of values in order to assess effects on performance on programmed materials. 32 Ss earned or lost points with monetary value for successful or unsuccessful performance in reading and learning

textual material. Performance was found not to be related in a direct manner to reinforcement magnitude. It is noted that Ss prefer to do accurate, rather than simply rapid, work.—*Journal abstract.*

5479. Blank, Harriett D. & Monge, Rolf H. (Syracuse U.) **Effects of awareness of alternative incentive magnitude and shifts in magnitude on card sorting.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 119-125.—Examined the absolute and relative interpretations of incentive magnitude. 80 Ss aged 20-67 yr. sorted cards for 20 trials. During Trials 1-13, Ss responded under either high or low reward (25¢ vs. \$3) and were either aware or unaware of the alternative incentive size. Rewards were earned for a women's club. Neither interpretation was supported, as no differences were found. 1/2 of each group was shifted to the alternative size and all Ss sorted for 7 more trials. No effects of shift were found. Failure to find differences in either phase is discussed in terms of the incentive used and its delivery to the organization. (16 ref.)—*Journal abstract.*

5480. Hekmat, Hamid & Lee, Young B. (Wisconsin State U.) **Conditioning of affective self-references as a function of semantic meaning of verbal reinforcers.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 427-433.—Conditioned affective self-references (ASRs) verbally using 3 different reinforcers: "wonderful," "mmm-hmm," and "good." Ss were 40 undergraduates divided randomly among 4 groups: "wonderful" contingent, "good" contingent, "mmm-hmm" contingent, and "mmm-hmm" noncontingent to ASRs. The group reinforced with "wonderful" produced the highest and the 1 with "mmm-hmm" the lowest frequency of self-references. The verbal reinforcer rated positively highest on Osgood's semantic differential scales produced the strongest conditioning effect. Results suggest that classical conditioning of meaning may underlie the establishment of reward value of verbal reinforcers. Osgood's semantic differential scales are of considerable value in identifying the magnitude of verbal reinforcers in behavior modification research and practice. (20 ref.)—*Journal abstract.*

MEMORY

5481. Bjork, Robert A. & Allen, Ted W. (U. Michigan) **The spacing effect: Consolidation or differential encoding.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 567-572.—Theoretical explanations of the spacing effect fall into 2 classes: those that attribute the advantage of 2 spaced presentations over 2 massed presentations to better consolidation of the 1st presentation, and those that attribute the advantage to better encoding of the 2nd presentation. An experimental test of the 2 classes of theory are reported, with 30 undergraduates serving as Ss. Rather than manipulate spacing, the information processing difficulty of the activity interpolated between 2 presentations of an item was varied. Consolidation-type theories imply decreasing consolidation with increasing difficulty of the interpolated activity. Recall performance following 2 presentations separated by a difficult task was found to be slightly but consistently better than performance following 2 presentations separated by an easy task. Results favor encoding-type theories.—*Journal abstract.*

5482. Blake, Denise & Mitchell, M. J. (U. Canterbury, Christchurch, New Zealand) **Effect of replacing correct items during paired-associate recall.** *Psy-*

chological Reports, 1970(Oct), Vol. 27(2), 427-430.—In 2 experiments with 40 undergraduates, it was found that replacing items correctly recalled during paired-associate learning gave no advantage over receiving completely new items on each trial. Superficially, this result appeared to support all-or-none theory, but item analyses show item difficulty to be a confounding factor. Failure of the drop-out paradigms to provide critical tests of all-or-none predictions is discussed.—*Journal abstract.*

5483. Bruce, Darryl & Papay, James P. (Florida State U.) **Primacy effect in single-trial free recall.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 473-486.—Hypothesized that the primacy effect may be due to initial list members being relatively free of proactive inhibition (PI), spending longer time in a limited-capacity rehearsal buffer, or being associated with stronger retrieval cues. In 3 experiments using a single-trial free-recall procedure, undergraduates (N=84, 160, and 213, respectively) were sometimes presented a forget cue during a list. The cue meant that they were not responsible for recalling any of the words which preceded it, only those which followed it. Since the primacy effect over the functional beginning of such lists was not diminished, the PI hypothesis was rejected. Tests of memory for list members which Ss were under the impression they could forget showed consistently depressed retention of items immediately preceding a forget cue. This result was more in harmony with a rehearsal-buffer notion than a stronger-retrieval-cues position. (23 ref.)—*Journal abstract.*

5484. Craik, Fergus I., Gardiner, John M., & Watkins, Michael J. (U. London, Birkbeck Coll., England) **Further evidence for a negative recency effect in free recall.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 554-560.—Examined results of F. I. Craik (see PA, Vol. 44:13805) experiment which indicated that the final words in a free-recall list were retrieved least well in a 2nd recall session. This negative recency effect was found to hold for reminiscence items and, to some extent, for prior list intrusions in recall. 2 further experiments showed that words retrieved in free recall were subsequently recognized less well if they had been presented late in their original input list. Undergraduates served as Ss. There was some evidence that a pattern of primacy and negative recency also held for the recognition of words not retrieved in free recall. It is concluded that terminal words in a free-recall list, although best recalled immediately, are thereafter least available in memory.—*Journal abstract.*

5485. Doll, Theodore J. (State U. New York, Stony Brook) **Motivation, reaction time, and the contents of active verbal memory.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 29-36.—Demonstrated the effect of motivation on information exchange between active and inactive memory in an experiment with 16 undergraduates. 2 sets of verbal items—1 recently viewed and the other memorized earlier—were presented for recognition. In 1 condition, reward was contingent on RT to recent probes only; in another condition, reward was contingent on RT to memorized probes only. In both conditions, RT was fastest to the items that were eligible for reward. Other findings suggest that this result is due to Ss' strategy of transferring the eligible set to active memory and consequent displacement or decay of ineligible items. 1st, error rate for recent probes was

greater when they were ineligible than when they were eligible. 2nd, the difference in RT for eligible and ineligible items increased with the amount of time the eligible set could be stored in active memory. 3rd, the effect of increased time in active memory depended on the stringency of the RT criterion for reward. And finally, the serial position functions for eligible items were generally indicative of rehearsal, while those for ineligible items were typical of unrehearsed items.—*Journal abstract.*

5486. Drew, Clifford J. & Altman, Reuben. (U. Texas) **Effects of input organization and material difficulty on free recall.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 335-337.—Compared the free recall performance of 30 undergraduates as a function of 2 degrees of external input organization and 2 levels of material associative strength. Ss recalled significantly more responses from organized than unorganized lists. S's performance was significantly influenced by difficulty of material. Material difficulty did not interact with degree of organization.—*Journal abstract.*

5487. Elliott, Lois L. (Central Inst. for the Deaf, St. Louis, Mo.) **Pitch memory for short tones.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 379-384.—A 300-msec tone was judged as higher or lower in pitch than another 300-msec tone that occurred 8 sec. earlier by 10 young adults with normal hearing. The intervening time either was unfilled or contained a 400-msec interpolated tone. This interpolated tone occurred either just after the 1st tone or just before the final one, and was of a frequency either inside or outside the critical band of the target frequency. Performance for the silent-interval condition was about as good as has been reported for pitch discrimination with no delay when the target was 250 Hz. but was slightly poorer for the target at 1550 Hz. Presence of the interpolated tone decreased the slope of the psychometric function and produced constant errors for 9 Ss. These effects were more pronounced when the interpolated tone occurred 50 msec. after the target than when it preceded the comparison tone by 50 msec. Both brevity of the target tone and occurrence soon thereafter of an interpolated tone are required to produce constant errors of pitch memory. (17 ref.)—*Journal abstract.*

5488. Fillenbaum, Samuel. (U. North Carolina, Chapel Hill) **On coping with ordered and unordered conjunctive sentences.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 93-98.—Determined whether 143 undergraduates were sensitive to the difference between sentences involving an ordered "and" (*) and those involving an unordered "and" (+), a distinction contingent upon knowledge of some semantic properties of the conjoined verbs. Performance on 2 comprehension tasks revealed that Ss did distinguish between + and * sentences. Consistent with this, performance on a memorial task indicated that when verb order was permuted, Ss were significantly more likely to falsely recognize + sentences than * sentences, to be expected if verbs in sentences of the latter kind but not of the former are entered in memory in ordered fashion. The principal unexpected finding is that on the paraphrase task, even when 2 additional strengthened versions were also employed, verb order was often permuted for disordered * sentences, normalizing them and assimilating the order of events described to conventional order.—*Journal abstract.*

5489. Forrester, William E. (State U. New York, Oswego) **Retroactive inhibition and spontaneous recovery in the A-B, D-C paradigm.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 525-528.—While significant retroactive inhibition (RI) was found in both modified-modified free recall and paced recall for A-B, A-C, and A-B, D-C paradigms, no RI was produced by a nonlearning task requiring a high rate of overt verbal responding in 160 undergraduates. Relative recovery was found for the A-B, D-C condition and absolute recovery for A-B, A-C. Results are discussed in terms of an unlearning of contextual associations hypothesis and a response-set interference hypothesis.—*Journal abstract.*

5490. Foss, Donald J. & Cairns, Helen S. (U. Texas) **Some effects of memory limitation upon sentence comprehension and recall.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 541-547.—Investigated the relationship between available short-term storage, sentence comprehension, and recall in a study in which 36 undergraduates were presented with word lists of varying lengths (0, 2, or 4 words) and then a sentence. 2 types of sentences (high or low in complexity) were used. Ss 1st recalled the word list and then, if correct, the sentence. Sentence recall varied inversely with list length, and recall of complex sentences was degraded relatively more than recall of simple sentences as list length increased. In another condition, Ss simply had to interrupt sentence rehearsal by saying 2 words before sentence recall. Results parallel the results of the 2-word condition, showing that interruption was the important variable. Various explanations of this finding were discussed.—*Journal abstract.*

5492. Golovan', E. T. **Model' assotsiativnoi pamyati.** [Model of associative memory.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 31-35.—Proposes a model for memory of the "2nd [Pavlovian] signal system," on the basis of which it may be possible to explain several of its properties.—*I. D. London.*

5493. Greeno, James G. (U. Michigan) **Conservation of information-processing capacity in paired-associate memorizing.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 581-586.—Reviews data that impose constraints on hypotheses regarding the role of temporal variables in memorizing, including results that apparently disconfirm J. G. Greeno's time-sharing hypothesis. An alternative hypothesis is proposed, in which it is assumed that S occasionally attenuates his rate of processing information for memory, with the probability of attenuation being relatively high when the item being presented is still in short-term memory as a result of a recent presentation. (15 ref.)—*Journal abstract.*

5494. Gupton, Tec & Frincke, Gerald. (U. Manitoba, Winnipeg, Canada) **Imagery, mediational instructions, and noun position in free recall of noun-verb pairs.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 461-462.—Studied free recall of noun-verb pairs using a factorial design employing 2 levels of noun imagery (high and low), instructions to think of a picture that goes with the pair or no instructions, and noun-verb or verb-noun pair ordering with 32 undergraduates. In each condition, Ss were shown 12 noun and verb pairs at

a 2-sec rate for 5 trials. A recall following the last trial showed significant memory facilitation due to high-imagery noun members ($p < .001$), instructions to use imaginal mediators ($p < .001$), and noun-verb ordering ($p < .01$). The Imagery \times Instructions interaction was significant ($p < .01$). Instructions were facilitative for pairs with high-imagery nouns but not for those with low-imagery nouns. Results are interpreted as an extension of previous findings on effects of imagery on the free recall of single items and paired-associate learning. Effects of presentation rate on the efficiency of mediational instructions and Ss' ability to employ imaginal mediators are discussed.—*Journal abstract.*

5496. Harwood, Elsie & Naylor, G. F. (U. Queensland, Brisbane, Australia) **Recall and recognition in elderly and young subjects.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 251-257.—59 60-80 yr. old Ss and 58 15-48 yr. old Ss were repeatedly shown 20 drawings of common objects at the rate of 1/2 sec until a criterion of 80% recall was achieved. Ss then believed their task complete, but were retested after 4 wk. for both recall and recognition. Elderly Ss proved significantly inferior to control Ss in both recall and recognition, and found recall more difficult than young Ss. No correlation was found between delayed recall or delayed recognition and the time actually spent in original learning or the number of exposures of the stimulus material. Delayed memory (both in recall and recognition) correlated significantly with the original level of immediate recall achieved in satisfying the criterion.—*Journal abstract.*

5497. Hintzman, Douglas L. & Block, Richard A. (U. Oregon) **Memory judgments and the effects of spacing.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 561-566.—55 paid volunteers saw a long series of words which varied in frequency ($F = 1, 3, \text{ or } 5$), and in spacing, ($S = 0, 1, \text{ or } 5$). 1/2 the Ss then judged frequency of occurrence of the words, and these judgments were an increasing function of spacing, $S = 0 < S = 1 < S = 5$. The other 1/2 judged the number of times in succession each word had occurred, and these judgments, correctly, were higher for $S = 0$ than for $S = 1$ or 5. Results indicate that some information about massed items is stored, and that on a retention test Ss can discriminate this information about spaced items. 2 explanations are suggested.—*Journal abstract.*

5498. Ioselevich, L. M. (Moscow State U., USSR) **Ob invariantakh ob'ema pamyati.** [On the invariants of memory-volume.] *Psikhologicheskoe issledovaniya*, 1969, No. 1, 143-148.—10 Ss participated in a comparative study of the invariants of short- and long-term memory in the memorization of the same material. Results show that the volume of short-term memory tends to invariance when measured in terms of number of symbols retained; that of long-term memory also tends to invariance when measured in terms of number of units of information retained.—I. D. London.

5501. Laughery, Kenneth R. & Pinkus, Allen L. (State U. New York, Buffalo) **A simulation model of short-term memory: Parameter sensitivity studies and implications for two current issues.** *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 554-571.—Formulates a simulation model of human short-term memory (STM) which postulates a number of basic information processes which are executed in a serial fashion and each has an associated time parameter. The model also postulates that information is lost from memory as a result of decay. The nature of this decay is exponential and its rate is a model parameter. Several studies were simulated in which the processing-time and decay-rate parameters were manipulated to determine the model's sensitivity to their parameters. Also, the model's performance was examined as a function of whether or not visual information is stored in STM and whether order information is retained perfectly or lost as a result of decay. Results of these simulated studies are compared to experimental data to determine at which parameter values and under which conditions of visual and order information storage the model performs most appropriately. 5509. Melton, Arthur W. (U. Michigan) *The situation with respect to the spacing of repetitions and memory.* *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 596-606.—The revival of interest in the effectiveness of spaced practice, as compared with massed practice, in learning is attributed to the abandonment of the constraints of serial and paired-associate list learning and the discovery of stable benefits from spaced practice in continuous paired-associate learning, short-term memory for individual items, and single-trial free-recall learning. Comments are made about the preceding symposium papers by B. J. Underwood, N. C. Waugh, and J. G. Greeno, and some data on the differential effects of spacing of repetitions in free-recall learning are introduced in an effort to assess the current state of fact and theory. (23 ref.)—*Journal abstract.*

5510. Mueller, John H. & Jablonski, Eugene M. (U. Missouri) *Instructions, noun imagery, and priority in free recall.* *Psychological Reports*, 1970(Oct), Vol. 27(2), 559-566.—Exp. I varied instructional sets in free recall, with 60 undergraduates instructed to combine words into sentences, mental pictures, both, or left to their own strategy. The pictures group was superior on both high- and low-imagery items. There was no evidence for summation of availability for Ss with both, or for superiority of the sentences group on low-imagery items. Low-imagery words tended to be recalled early on acquisition trials but to be late in output on a delayed test. Exp. II with 60 Ss used only own strategy and pictures instructions for lists varying orthogonally on imagery and frequency, with $\frac{1}{2}$ of the Ss in each group informed of the general list composition. The latter seemed to have no effect, and the pictures set was effective only for high-imagery items. The priority effects were most pronounced for the low-imagery-high-frequency subset.—*Journal abstract.*

5511. Natkin, Gerald & Stahler, Elizabeth. (Bucknell

U.) *The effects on adjunct questions on short and long-term recall of prose materials.* *American Educational Research Journal*, 1969(May), Vol. 6(3), 425-432.—Investigated the effects of adjunct questions and preexposure to adjunct questions on immediate and delayed recall of prose material. It was predicted that with no preexposure, adjunct questions would lead to recall gains over time, while with exposure, performance would drop over time. 28 undergraduates were given either no or 15-min preexposure, and then a passage containing either 0 or 25 adjunct questions. All Ss were tested on the 2nd passage immediately upon completion and 1 wk. later. Results confirm the predicted interaction effect, and are interpreted as demonstrating that adjunct questions can have an arousal-producing effect, which diminishes with repeated exposures.—*Journal abstract.*

5512. Nevel'skii, P. B. & Mel'nik, I. M. *Vliyaniye irrelevantnoi informatsii na zapominaniye u cheloveka.* [Influence of irrelevant information on human memorization.] *Problemy Bioniki*, 1970, No. 3, 108-111.—Irrelevant information, bearing no relation to the goal content of human activity, exerts a negative effect on the memorization of useful information. The coding of information, where only useful information is presented to the human operator, increases the carrying capacity of his short-term memory and, consequently, of the entire man-machine system.—*I. D. London.*

5513. Perfetti, Charles A. & Goodman, Doba. (U. Pittsburgh, Learning Research & Development Center) *Semantic constraint on the decoding of ambiguous words.* *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 420-427.—Studied the effects of semantic context on decoded word meaning by means of recognition memory. In Exp. I, 101 female undergraduates were tested for single-word recognition under 1 of 3 conditions, 2 of which constrained the interpretation of semantically ambiguous words in 1 of 2 ways. In a 3rd condition, Ss heard the ambiguous words as part of a word list. The main result was that false recognitions were induced to associates of the ambiguous word that reflected the meaning cued by its sentence. False recognitions to noncued associates than to control words were not significantly more frequent. In additional experiments with 92 undergraduates, the effect of single-word context on the recognition of ambiguous words were studied by varying which of 2 cue words preceded an ambiguous word. Whereas Exp. I indicates that decoding is determined by sentence context, the remaining experiments suggest that single words have little or no effect.—*Journal abstract.*

5514. Polzella, Donald J. & Rohrman, Nicholas L. (U. Michigan) *Psychological aspects of transitive verbs.* *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 537-540.—Exp. I, with 30 undergraduates, replicated a previous finding by N. L. Rohrman (see PA, Vol. 43:3456) and N. L. Rohrman and D. J. Polzella (see PA, Vol. 43:1991) that transitive verbs are more difficult to recall than intransitive. Exp. II with 30 undergraduates examined the associations to, and response latencies of, transitive, and intransitive verbs. Latencies of responses did not differ, but the form class of responses was significantly different. Transitive verbs elicited more noun responses. It is suggested that the lexical entry provided for transitive verbs by N. Chomsky is psychologically real and will account for the observed differences.—*Journal abstract.*

5515. Rohrman, Nicholas L. (Florida State U.) **More on the recall of nominalizations.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 534-536.—2 experiments with 30 undergraduates each. demonstrated that transitive verbs and inanimate nouns in isolation were more difficult to recall than intransitive verbs and animate nouns. Thus, explanations of recall differences based on node counting indices are questionable. It is suggested that lexical representations will account for the recall differences observed in single items. However, the relation between syntactic complexity and lexical representation is still unresolved.—*Journal abstract.*

5516. Rosenberg, Sheldon & Jarvella, Robert J. (U. Illinois, Chicago) **Semantic integration and sentence perception.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 548-553.—Presented a mixed list of semantically well-integrated (SWI) and semantically poorly integrated (SPI) sentences for shadowing to 20 undergraduates under quiet and 20 Ss under noise (5-db signal-to-noise ratio). The SWI and SPI sentences were balanced for length, number, and stress of syllables, number and type of phones, noun animateness, and word frequency. An incidental-recall task followed 1 trial of shadowing. As anticipated, shadowing under quiet was virtually perfect for both SWI and SPI sentences, noise reduced shadowing overall and SWI sentences were shadowed better than SPI sentences under noise. Incidental learning of SWI material was enhanced by noise, and noise produced a difference in incidental learning in favor of SWI material. (15 ref.)—*Journal abstract.*

5517. Ross, John. (U. Western Australia, Nedlands) **Extended practice with a single-character classification task.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 276-278.—Gave extended practice to 4 undergraduates on a single-character classification task with 4 nested checklists of Sizes 1, 2, 4, and 8 defining positive sets. RT reduces with practice, but is linear with the logarithm of checklist size at all stages of training, and transfers to characters of large size and different case.—*Journal abstract.*

5518. Rubenstein, Herbert; Garfield, Lonnie, & Millikan, Jane A. (Lehigh U.) **Homographic entries in the internal lexicon.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 487-494.—89 undergraduates distinguished between English and nonsense words, which were displayed singly. The display persisted until S pressed the yes-key if he thought the stimulus was English or the no-key if he thought it was nonsense. The response times were faster for English than nonsense, faster for words of higher frequency than lower frequency, and faster for homographs than nonhomographs. It is hypothesized that word recognition in general requires consulting the internal lexicon. A model of the underlying processes is sketched which proposes that words of higher frequency are recognized sooner because their lexical entries are marked earlier for comparison against the stimulus information. It is also proposed that homographs are recognized sooner than nonhomographs since homographs have more lexical entries available for comparison against the stimulus information.—*Journal abstract.*

5519. Slak, Stefan. (U. Toledo) **Phonemic recoding of digital information.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 398-406.—Studied the effect of phonemic recoding on human memory with the aid of a phonemic code permitting recoding of random

decimal numbers into phonemic sequences, so that 1 phoneme contained the same information as a decimal digit. 2 Ss underwent intensive code training. In Exp. I-IV, 2 Ss were tested repeatedly on memory span, usual and self-paced serial learning, and recognition; in Exp. V and VI, 1 S was tested repeatedly on free learning and self-paced free recall tasks. Testing was with and without phonemic recoding. In Exp. VII, a recoding group of 10 undergraduates was compared with a control group (N = 10) on a serial-learning task. Phonemic recoding resulted in a dramatic improvement in performance in all experiments. In Exp. VIII with 60 undergraduates, memory span for phonemically encoded digits was higher than for uncoded digits. The recoding effect was interpreted in terms of substitution of a less redundant for a more redundant form of information. The constant chunk recall hypothesis was not supported.—*Journal abstract.*

5520. Smirnov, B. A. **O kiberneticheskikh model-yakh pamyati.** [On cybernetic models of memory.] *Problemy Bioniki*, 1970, No. 3, 112-115.—Examines 1 of the possible approaches to "macromodeling of the processes of memory." A formula is developed for computing the "probability of information-service" in short- and long-term memory as well as the probability of loss of information. Parameters, characterizing the activity of memory, are introduced. The proposed model can be utilized in the construction of a general model of human activity, connected with the acceptance, preservation, and reproduction of information.—*I. D. London.*

5521. Smith, Marilyn C. & Ramunas, Susan. (U. Toronto, Ontario, Canada) **Elimination of visual field effects by use of a single report technique: Evidence for order-of-report artifact.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 23-28.—When Ss are asked to recall verbal materials tachistoscopically presented simultaneously in both visual fields, recall is typically better for items in the left visual field. Some Es have interpreted this finding as indicating a perceptual mechanism that necessitates scanning the memory trace in a left-to-right order, with fading of the elements in the right field while those in the left are being scanned. An alternative explanation is that since Ss tend to report the items in a left-to-right order, there is fading of the memory trace for the right-hand elements during the relatively slow task of reporting the earlier items. To differentiate between the 2 theories, 25 right-handed 15-22 yr. old students reported only 1 item, as indicated by tactile vibration of 1 of their fingers immediately after presentation of the visual materials. Using this technique, no left-right field differences were found. Exp. II, with 6 right-handed undergraduates, examined the effect of varying the interval between presentation of items and occurrence of the signal indicating the letter to be recalled. Even with intervals of 2000 msec., no left-right differences were found. (17 ref.)—*Journal abstract.*

5522. Sokolov, E. N. (Moscow State U., USSR) **Issledovanie pamyati na urovne makroreaktsii.** [Study of memory at the macroreational level.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 441-452.—An analysis of a number of experiments leads to the discernment of 3 basic types of trace effects: (a) "Retention of heightened excitability for 15-30 sec. after termination of the action of a preceding stimulus." On repetition of the signals with smaller intervals, the trace effects summate, leading to shortening of latent periods, increase in reliability of signal detection, and decrease in

the variability of the parameters of orienting and motor CRs. (b) "Retention for a long time of a trace in the form of a nervous model of the experienced stimulus, securing the selective suppression of orienting reactions and the selective intensification of CRs to the repeated stimulus." The temporal sequence of signals is 1 of the parameters, fixed in the "nervous model [counterpart] of the stimulus." (c) "Stamping in of a 'given standard' after single presentation [thereof], which is kept in the memory in spite of possible interference on the part of the test stimuli, utilized in the experiment." The trace of the "given standard," which determines reliably the reactions to a signal, does not coincide with the "process of the nervous model [counterpart] of the stimulus"—a model which is elaborated with respect to the entire system of utilized stimuli. In its turn, extinction of the orienting reactions during formation of the "nervous model of the stimulus" occurs against a background of increased excitability, arising with repetition of the stimulus. If trace effects in the form of heightened excitability quickly disappear with time and disclose no effect of accumulation as the experiments proceed, then the trace effect in the form of extinction, although easily abolished by incidental stimuli and weakened with interruptions in the experiments, discloses, nevertheless, accumulation from 1 experimental day to another.—*I. D. London.*

5523. Swanson, James M. & Wickens, Delos D. (U. Texas) **Preprocessing on the basis of frequency of occurrence.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 378-383.—Used the release from proactive inhibition (PI) methodology to test R. C. Oldfield's (see PA, Vol. 40:3726) suggestion that human memory is organized in part on the basis of frequency of occurrence. 160 undergraduates served as Ss. 120 words, of either high or low frequency were chosen from the Thorndike-Lorge word book. Ss received triads composed of verbs or nouns on all trials. An observed release from PI identified frequency of occurrence as an encoding category and supported the underlying assumptions of Oldfield's model.—*Journal abstract.*

5524. Teghtsoonian, Martha & Teghtsoonian, Robert. (Smith Coll., Clark Science Center) **Transitory effect of number of alternatives on performance in a recognition task.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 467-468.—The number of choices required to locate a previously seen item among a group of alternatives is inversely related to the number of alternatives (n) provided. 2 groups of 28 Ss were given 3 trials for recognition learning of 16 3-digit numbers, making their selections from 4 and 16 alternatives/item, respectively, with the correct item displayed after each choice. Each group was split into 2 subgroups so that for the succeeding 3 trials, 1/2 of each group continued with the same number of alternatives while the other 1/2 shifted to the other value of n. Results show that n always has a pronounced effect on any given trial, but that the effect does not extend to subsequent trials when n has been changed. The number of alternatives is a parameter of performance but not of learning in this recognition task.—*Journal abstract.*

5526. Tulving, Endel & Psotka, Joseph. (Yale U.) **Retrospective inhibition in free recall: Inaccessibility of information available in the memory store.** *Journal*

of Experimental Psychology, 1971(Jan), Vol. 87(1), 1-8.—Produced retrospective inhibition under free recall conditions in an experiment in which 128 high school and university students learned and subsequently recalled from 1-6 categorically structured lists. The observed retrospective inhibition was attributable mainly to the lowered probability of recall of word categories as higher order memory units. Recall of words within recalled categories was not greatly affected. Presentation of category names as retrieval cues largely removed retrospective effects and restored word recall to nearly its original level. It is concluded that retrospective inhibition in free recall of organized lists (a) represents a state of memory in which higher order units of information are available but not accessible in the memory store, (b) reflects altered stimulating conditions brought about by interpolated learning, and (c) can be described as an instance of cue-dependent forgetting. (15 ref.)—*Journal abstract.*

5527. Tulving, Endel & Thomson, Donald M. (Yale U.) **Retrieval processes in recognition memory: Effects of associative context.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 116-124.—Recognition of a single word is impaired when another, associatively related, word accompanies it at the time of the test. Recognition of a word presented at input as a member of an associatively related pair is impaired when the other member of the pair is removed or changed at test. These context effects suggest that retrieval or utilization of stored mnemonic information in a recognition-memory task depends on both availability and accessibility of this information. It is argued that nominally identical input and test items may sometimes be encoded differently because of their different cognitive environments, with the consequence that the "old" test item as a retrieval cue fails to provide access to the stored information about the earlier occurrence of its copy. Results of an experiment with 60 undergraduates, and their interpretation disagree with the widely held view that "there is no retrieval problem in recognition memory." (16 ref.)—*Journal abstract.*

5528. Underwood, Benton J. (Northwestern U.) **A breakdown of the total-time law in free-recall learning.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 573-580.—Reports 5 experiments in which single-trial free recall followed various frequencies of repetition under massed (MP) and distributed (DP) schedules. In all experiments the DP schedule resulted in better recall than the MP schedule, and the difference between MP and DP increased as the frequency of repetition increased. This was true for sentences, nonsense syllables, and words. Various activities inserted between successive words in the lists did not change the basic findings. (15 ref.)—*Journal abstract.*

5529. Uteush, E. V. **Analiz psikhofiziologicheskikh osobennostei cheloveka-operatora na osnove modelirovaniya vzaimozavisimosti pamyati i deyatelnosti: I.** [Analysis of the psychophysiological features of the human operator on the basis of modeling the interconnections between memory and activity: I.] *Problemy Bioniki*, 1970, No. 3, 129-134.—Analyzes the processes involved in the preservation of information in memory as processes embedded in a dynamic system, so that memory can be studied by the methods employed to investigate dynamic objects. The traditional methods of psychology for evaluating habit and memory are seen as special cases of a more general method of studying memory as a dynamic object. An interpretation of the

findings of A. N. Leont'ev's research is made the basis of this view. "The process of developing the structure and volume of buffer-memory as a function of age" is modeled as a "multi-capacity object with a time span of 4.2 yr."—*I. D. London.*

5530. Uteush, E. V. *Analiz psikhofiziolozicheskikh osobennostei cheloveka-operatora na osnove modelirovaniya vzaimozavsimosti pamyati i deyatelnosti: II.* [Analysis of the psychophysiological features of the human operator on the basis of modeling the interconnections between memory and activity: II.] *Problemy Bioniki*, 1970, No. 3, 135-141.—Reflex systems with memory are described as objects with concealed cycles. Statistical criteria are proposed for the trainability of the human operator. Experimental confirmation of the usefulness of these criteria is adduced.—*I. D. London.*

5531. Warrington, Elizabeth K. & Silberstein, M. (National Hosp., London, England) **A questionnaire technique for investigating very long term memory.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 508-512.—Describes a questionnaire technique, based on public events, for quantifying memory over long periods of time. Independent groups of Ss were tested at intervals of 6 mo. on a recall and multiple choice version of the questionnaire. A consistent relationship between memory and both age of Ss and passage of time was found. An error analysis is presented.—*Journal abstract.*

5532. Zacker, Joseph W. (City Coll., City U. New York) **Effect of reverie on recall of word associates.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 423-426.—Postulated that amnesia for childhood events may be due to differences between the child's and the adult's states of consciousness rather than repression alone. 12 male undergraduates underwent each of 2 experimental conditions, 1 designed to foster alertness, the other a reverie state. Prior to each experimental condition Ss studied stimulus words, each paired with 1 of 2 associates. 1/2 of the words had 1 associate more typically a child's response and 1 more typically a young adult's response. After each experimental condition S named the 1st associate he recalled for each stimulus word. As predicted, more child-associates were recalled after the reverie condition than after the alert condition.—*Journal abstract.*

Short Term & Immediate Memory

5533. Buschke, Herman & Kintsch, Walter. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Rehearsal strategies and the serial-position curve in immediate free recall of ordered items.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 347-352.—Studied immediate free recall of random strings of 10 numbers with 12 paid undergraduates under 4 experimental conditions: as each number was presented, Ss either had to recall the previous number (recall n-1), recall the number just presented (recall n), read the number (read aloud), or were silent (free recall). Overall recall was the same in all conditions. Recall and order of recall by serial-position changed systematically, with an increasing recency and decreasing primacy effect from free recall through read aloud and recall n to recall n-1. These changes in recall order and serial-position curves suggest that differential rehearsal of items is decreased by requiring retrieval during presentation.—*Journal abstract.*

5534. Campos, Leonel & Siojo, Luis. (U. Manila, Philippines) **The recall of single paired associates with an A-B, A-Br sequential paradigm.** *Philippine Journal of Psychology*, 1969(Jun), Vol. 2(1), 39-42.—Adopted a sequential A-B, A-Br paradigm in a short-term memory task to test the possibility that novel combinations of the same stimulus and response items would result in proactive interference (PI) in the recall of paired associates. Ss were 108 male undergraduates. No definite evidence of increasing PI was found, thus supporting the notion of a "limited capacity" hypothesis as an explanation for short-term memory behavior.—*Journal abstract.*

5535. Cohen, Ronald L. & Granström, Kjell. (U. Uppsala, Sweden) **Reproduction and recognition in short-term visual memory.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 450-457.—Tested reproduction and recognition in short-term visual memory. In Exp. I, it was confirmed that the ability to reproduce visual figures in short-term memory correlated with the ability to describe them. No such correlation was obtained when recall was by recognition. In Exp. II and III the mechanisms involved in the 2 types of recall were investigated by varying the character of the task interpolated in the retention interval. Results support the view that reproduction has a verbal component which is lacking in recognition.—*Journal abstract.*

5536. Detterman, Douglas K. & Ellis, Norman R. (U. Alabama) **A factor analytic demonstration of two memory processes.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 484-493.—Obtained a principal component solution and varimax rotation for 8 studies using a serial position (SP) probe technique for studying short-term memory. The factor pattern which emerged showed the 1st and middle SPs to load on the primacy factor, while the middle and last positions loaded on the recency factor. Results are consistent with the view that short-term memory is composed of 2 processes, primary and secondary memory. 1 study supports the notion that immature humans show a rehearsal deficit. (17 ref.)—*Journal abstract.*

5537. Dornič, S., Chalupa, B., & Sehnalová, J. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Recall of symbols used in a searching task.** *Studia Psychologica*, 1970, Vol. 12(2), 120-124.—Ascertained the relationship between the quantitative characteristic of performance in searching letters and dials on search panels and their subsequent recall. Each panel was comprised of 49 elements. 1 group of Ss searched 20, another 10 elements. The 2nd stage of the experiment ascertained the total number of recalls and that of errors. 20 19-20 yr. old girl students took part in each variant of the experiment. Search of dials proved to be substantially more difficult than that of letters. However, the number of correct recalls of dials was higher than that of letters (significantly so when 20 elements were searched). Causes of the differences in performance during perceptual analysis are discussed. It is understood that different stages of information processing are involved, in which a number of variables are utilized. The task of perceptual analysis is made significantly more difficult by a double information encoding in dials; dial recall is easier than that of letters because it can draw support from more associations. (Czech & Russian summaries)—*Journal abstract.*

5540. Herman, Louis M. & Bailey, David R. (U. Hawaii) **Comparative effects of retroactive and proactive interference in motor short-term memory.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 407-415.—Tested 48 male undergraduates for their short-term memory (STM) (24 sec.) for discrete force responses as a function of selected activities occurring either prior to (PI) or following (RI) the criterion force response. On a given trial, the activity was either (a) production of a 6-sec force response of greater magnitude than the criterion, (b) a 6-sec force response of lesser magnitude than the criterion, (c) counting backwards for 6 sec., or (d) passively sitting (control). All variables were within-Ss effects except for the inter-response interval (IRI), either 4 or 14 sec., separating an activity and the criterion response. Significant differences in recall of the criterion as a function of the 4 different activities was observed for RI but not for PI. The effects of the activities were considerably greater at the 14-sec than at the 4-sec IRI for the RI condition. There was no effect of the IRI variable for the PI condition. Comparisons were made with prior significant within-trial PI effects in motor STM, with prior significant RI effects in motor STM, and with a variety of findings from studies of verbal memory. (19 ref.)—*Journal abstract.*

5542. Mohan, Jitendra. (Panjab U., Chandigarh, India) **Reminiscence, personality and disinhibition.** *Studia Psychologica*, 1970, Vol. 12(2), 147-150.—Analyzed the personality determination of the effect of disinhibiting stimulus on reminiscence in pursuit rotor performance. 40 female postgraduates, divided into 4 groups on the basis of their scores on the MPI, acted as Ss. In a 300-sec work period, a disinhibiting light flash was introduced for 2 sec. after 290 sec. of practice. Results indicate the negative influence of disinhibitory stimulus on the reminiscence of extroverted Ss. The dimension of neuroticism failed to give any definite indication. (Czech & Russian summaries) (20 ref.)—*Journal abstract.*

5543. Morganstein, Stanley. (2942 W. 5th St., Brooklyn, N.Y.) **Effect of encoding on short-term memory.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 387-392.—Investigated the effect of encoding on short-term memory, in which S serial-recalled binary sequences of stimuli whose length varied (2, 4, and 8). 36 undergraduates were presented with sequences of red and green lights under 3 retention intervals (2, 4, and 16 sec.) for 1 experimental session. Accuracy and latency were found to approximate, respectively: bow shaped and inverse bow-shaped functions of number of changes of state within sequences. Results are interpreted to reflect the use of a provisional verbal code whose measure is its length.—*Journal abstract.*

5544. Puff, C. Richard. (Franklin & Marshall Coll.) **Role of clustering in free recall.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 384-386.—Compared single-trial free recall for 76 undergraduates given a categorized word list (C list) and 40 Ss given a noncategorized list (NC list). There was no difference in the amount recalled from the C list by Ss who exhibited significant clustering and those Ss whose clustering did not exceed chance, but both C-list groups recalled more words than the group given the NC list. The occurrence of clustering at the time of output does not, therefore, seem to be an important determinant of the amount that can be remembered.—*Journal abstract.*

5546. Shulman, Harvey G. (Ohio State U., Human Performance Center) **Encoding and retention of semantic and phonemic information in short term memory.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 499-508.—Used a probe recognition task to evaluate the relative effectiveness of semantic and phonemic encoding in short-term memory (STM). On each trial a list of 10 words was presented at a rate of either 350, 700, or 1400 msec/word. Recognition was tested with a probe which could be a homonym, a synonym, or identical to 1 of the words in the list. The retention functions for all 3 probe types were similar in shape, supporting the hypothesis that semantic encoding is possible in STM. An interaction between type of encoding and rate occurred, indicating that encoding is a time-dependent serial process.—*Journal abstract.*

5547. Shulman, Harvey G. (U. Michigan) **Presentation rate, retention interval, and encoding in short-term recognition memory for homonyms, synonyms, and identical words.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 939.

5548. Underwood, Benton J. & Freund, Joel S. (Northwestern U.) **Word frequency and short-term recognition memory.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 343-351.—In Exp. I, high-frequency words resulted in poorer recognition performance than did low-frequency words only when the new words on the test were also high-frequency words. 30 undergraduates were assigned to each of 4 conditions. With low-frequency words recognition was nearly errorless. These findings are interpreted by assuming that a frequency attribute dominates recognition performance, and that frequency information for high-frequency lists is influenced by implicit associational responses. Since performance on the recognition test deteriorated during testing, Exp. II used retention intervals of up to 6 min. and show that this effect for low-frequency words was not due to the testing itself but to forgetting over time; for high-frequency words, the results were less clear-cut. It is suggested that forgetting may be retarded by increased temporal discrimination between old and new words.—*Journal abstract.*

5549. Waugh, Nancy C. (Harvard Medical School, Boston, Mass.) **On the effective duration of a repeated word.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Oct), Vol. 9(5), 587-595.—Reports 3 experiments on immediate free recall. Lists of words were read rapidly or slowly or at a variable rate; some items occurred only once while others were presented 2 or more times within a list, either in immediate succession

or at widely separated locations. Results indicate that an item's frequency of recall depends not only on how often it is presented, and for how long, but also on the average duration of the items that surround it. When the rates at which items occur exceed the rate at which they can be processed for storage, S evidently attends fully to each in turn; while in the opposite case he evidently tries to distribute his attention as evenly as possible among all of them.—*Journal abstract.*

THINKING

5550. Cohen, Gillian. (Inst. of Experimental Psychology, Oxford, England) **Search times for combinations of visual, phonemic, and semantic targets in reading prose.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-B), 370-372.—12 graduate and undergraduate Ss read passages of prose, canceling targets that were visual (letters), acoustic (phonemes), or semantic (words of a specified category). Each of the targets occurred singly and in all possible double and triple combinations. Comparison of the search times revealed that semantic processing adds little or no extra time when combined with acoustic or with visual and acoustic searches, i.e., it occurs in parallel. Other combinations of processing yield search times that are slightly faster than a serial model would predict and are best interpreted as reflecting an overlapping sequence of operations.—*Journal abstract.*

5551. Luchins, Abraham & Luchins, Edith H. (State U. New York, Albany) **Wertheimer's seminars revisited: Problem solving and thinking: I.** Albany, N.Y.: State U. New York, Faculty-Student Assn., 1970.—After a preface containing descriptions by students of Wertheimer the teacher, seminars are centered around verbatim remarks by Wertheimer. The topics discussed are: how to initiate the study of thinking; the concept and teaching of area; good and bad solutions; genuine, productive solutions; the role of chance in problem solving of trial and error and of insight; the role of structure and of experience; logic and the genuine solution; some problems involving physics, extensions of Wertheimer's approach to teachings area; teaching algebra, completing the square; and some aspects of the creativity problem in thinking. Each chapter reports several unpublished investigations done with Wertheimer as well as experimental outgrowth; questions are raised for future research. The discussion and experiments are related to enduring problems of thinking, learning, and teaching as well as the contemporary theory and practice, e.g., learning by discovery, Piaget's theory. A commentary after each chapter attempts to elucidate philosophical and historical questions. (250 ref.)—*Author abstract.*

5552. Luchins, Abraham & Luchins, Edith H. (State U. New York, Albany) **Wertheimer's seminars revisited: Problem solving and thinking: III.** Albany, N.Y.: State U. New York, Faculty-Student Assn., 1970.—This volume focuses on theoretical and practical problems in the understanding and control of habituation and reorganization of behavior. It presents Wertheimer's views about theoretical and pedagogical issues concerning mechanization, transfer of training, creativity, rigidity of behavior, discrimination and verbal learning, psycholinguistics, computer simulation of human thinking, concept formation, resistance to new ideas in science, ways to train doctoral students for research and how to write research reports. Topics covered include:

the Einstellung effect, a case history of the study; demonstrations and discussions of Einstellung effects; Einstellung effect and repetition; attitudes and assumptions that lead to Einstellung; explaining the experiment results; towards an understanding of Einstellung; theoretical issues and Einstellung effect; proposals for research; recent experiments on the Einstellung effect; on reorganization and problem solving; and experimental outgrowths on reorganization. Scores of experiments which were completed or started with Wertheimer as well as current research that are outgrowths of the discussion are published for the first time.—*Author abstract.*

5553. Roberge, James J. (Temple U.) **Further examination of mediated associations in deductive reasoning.** *Journal of Experimental Psychology*, 1971 (Jan), Vol. 87(1), 127-129.—Studied the effect of syllogistic figure upon reasoning errors and certainty of judgment in 26 male and 26 female undergraduates. Results indicate significant differences in both number of errors ($p < .01$) and certainty of judgment ($p < .05$) according to syllogistic figure. No significant sex differences were found. In general, the results are consistent with theory and research in both verbal learning and deductive reasoning.—*Journal abstract.*

5555. Poznyanskaya, É. D. & Tikhomirov, O. K. (Moscow State U., USSR) **O funktsiyakh dvizhenii glaz.** [On the functions of ocular movements.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 25-30.—Presents a cinematographic study of eye movements accompanying the solution of problems in chess. The movements are shown to be associated with those elements constituting a single system whose solution possibilities are to be tested. The data of eye behavior make possible an objective analysis of mental activity in problem solving.—*J. D. London.*

5556. Rollings, Harry; Bethel, Barbara, & Deffenbacher, Kenneth. (U. Nebraska, Omaha) **Relevant cue placement effects in concept identification tasks.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 9-12.—2 experiments, with 100 and 80 undergraduates, employed an enforced verbal encoding procedure to determine whether there were relevant cue placement effects on performance in 2 simple concept identification (CI) tasks. In Exp. I—a single-cue CI task—the serial position of the relevant cue in the encoding order and the encoding method, grammatical or nongrammatical, were varied. A pronounced serial position effect and a method of encoding effect were obtained. Exp. II, a redundant relevant cue (RRC) CI task, varied the degree of RRC separation in the encoding order and method of encoding. There was faster learning if the 2 RRCs were separated by 2 irrelevant cues than if they were separated by none; the method of encoding did not contribute significantly to performance. There was a somewhat greater tendency for both RRCs to be learned if they were next to each other in the encoding order.—*Journal abstract.*

5557. Seymour, Philip H. (U. Dundee, Scotland) **Order of fixation effects in classification of word-shape pairs.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 440-449.—12 undergraduates classified the word-shape configurations circle/circle, square/square, circle/square, and square/circle by reporting "yes" for a relationship of congruence, and "no" for a relationship of incongruence. The latency of initiation of these reports was recorded, measured from the simultaneous onset of the displays. The order in which the word and shape were inspected had consistent effects on the latency, times being shorter where the word was seen before the shape. The relevance of this finding to an account of the conversion operations involved in a word-shape comparison is discussed. (22 ref.)—*Journal abstract*.

5558. Tikhomirov, O. K. & Vinogradov, Yu. E. (Moscow State U., USSR) **Emotsii v funktsii évrístik.** [Emotions in the heuristic function.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 3-24.—2 chess players of the 1st rank were used to study relationships obtaining between thinking and the emotional processes encountered in successive phases of "creative thinking [complex problem solving]": "the birth of the idea behind the solution, the discovery of the basic principle, etc." The GSR was chosen as chief indicator of the "states of emotional activation" during the attempt to arrive at "creative solutions" of complex chess problems. Recordings were also made of accompanying speech reactions. Results are presented under the following headings in sequence: (a) the general dynamics of skin resistance in the process of solving mental problems, (b) emotional activation and the formulation of the initial solution of a problem, (c) change in activity after a state of emotional activation has set in, and (d) the necessity of states of emotional activation. The study demonstrates the existence of a "sufficiently distinct connection between states of emotional activation and the discovery of the basic principle for the solution of a problem." It is shown that, in the solution of complex mental problems, the emotions serve a "heuristic function."—I. D. London.

Concepts

5559. Block, Karen S. (Ohio State U.) **Hypothesis sampling and dimension selection models of concept identification for problems with ternary dimensions.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 925.

5560. Giambra, Leonard M. (Miami U.) **Selection strategies for eight concept rules with nonexemplar start cards.** *Journal of Experimental Psychology*, 1971 (Jan), Vol. 87(1), 78-92.—Determined the extent of usage of the ideal strategies of focusing (and scanning) for 8 concept rules by the "matching" method of J. S. Bruner, J. J. Goodnow, and G. A. Austin and focusing index method of P. R. Laughlin (see PA, Vol. 42:16633). Ss were 6 undergraduates. Ideal focusing strategies for the concept rules with nonexemplar start cards were explicated. The order of usage of the focusing strategy was predicted, but not found, to be the inverse of the order predicted with the exemplar start cards. In addition, a 3-way interaction with number of irrelevant dimensions (IR) was expected and obtained, and was due to unpredicted changes in the relative order of usage of focusing with the 8 concept rules as the number IR

increased from 1 to 2 under exemplar and nonexemplar start cards. (19 ref.)—*Journal abstract*.

5561. Giambra, Leonard M. (Miami U.) **Selection strategies for eight concept rules with exemplar and nonexemplar start cards: A within-subjects replication.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 143-145.—Performed a partial replication of L. M. Giambra (see PA, Vol. 45:Issue 4) which investigated selection strategies with 8 concept rules (conjunction, disjunctive absence, inclusive disjunction, conjunctive absence, conditional, exclusion, biconditional, and exclusive disjunction) with exemplar and nonexemplar start cards. Ss were 10 undergraduates. With exemplar start cards, high correspondence with the results of Giambra was observed with regard to the relative degree of focusing strategy usage among the 8 concept rules. With nonexemplar start cards a poor correspondence with Giambra occurred and was attributed to a differential extended practice effect among the eight concept rules.—*Journal abstract*.

5562. Holas, Emil. (U. Palacky, Olomouc, Czechoslovakia) **Logique et psychologie de l'apprentissage des concepts.** [Logic and psychology of concept learning.] *International Journal of Psychology*, 1969, Vol. 4(3), 161-181.—Psychological and logical distinction and definition of concepts mark a central problem in investigating concept learning. Logical analysis of concept learning phenomena involves application of elementary theorems of logic and set theory. Concept learning depends on a precise algorithm. While logical features affect concept learning, other influences, such as memory, perceptual-motor activity, and the number of redundant examples involved are also implicated. Global characteristics of individual performance reveal the need for both stochastic models of learning and for logical and mathematical interpretation, since different operations appear fundamental to explain the complex process. (English abstract) (24 ref.)—S. E. Gavin.

5563. Joyner, Robert C. (York U., Toronto, Ontario, Canada) **Computer simulation of individual concept learning in the three-person common target game.** *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 478-514.—Constructed, following 5 laboratory studies, a computer model that simulated the behavior of the individual player in the 3-person common target game. The concept selection model, COMTARG, contained 3-model-relevant individual difference parameters and general deterministic mechanisms. Computer Ss were constructed according to a specified method of sampling the values of the 3 parameters. Program runs for the computer Ss were made previous to observing humans playing the game under 2 previously unobserved treatment conditions in a 6th experiment. A number of tests demonstrate that COMTARG compares favorably with the human grouped data and reveal some of COMTARG's limitations. (19 ref.)—*Journal abstract*.

5564. Seggie, J. L. (U. Newcastle, New South Wales, Australia) **Levels of learning involved in conjunctive and disjunctive concepts.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 325-333.—67 undergraduates in 4 groups learned conjunctive and disjunctive concepts under 2 conditions. The 1st condition required classification of the stimuli into positive and negative categories; the 2nd required that they be classified into neutral categories. The conjunctive concept was significantly easier to learn only when the Ss were required to classify the stimuli in positive/negative

terms. Under neutral conditions no difference existed between the 2 types of concept. It was found that all Ss could correctly state the truth value of the inverse of the learned concepts. However, none of the Ss who learned the conjunctive concepts in the positive/negative condition made use of the information available from the inverse, whereas Ss in all other conditions did.—*Journal abstract.*

DECISION & CHOICE BEHAVIOR

5565. Appelbaum, Mark I. (U. Illinois) **A methodological study of preference.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 893.

5566. Gutiérrez Cabria, Segundo. **Juegos no cooperativos de n personas y decisiones, en conflicto de interés.** [Noncooperative games of n persons and decisions, in conflict of interest.] *Trabajos de Estadística y de Investigación Operativa*, 1969, Vol. 20(1), 53-83.—Examines the motives for human decision through an analysis of information schemes on the entire decision problem. Noting that the aim of all decisions and games is to reach a point of equilibrium, the directions of J. F. Nash and Harsanyi are discussed. The Zeuthen principle is considered, along with the relation between the Nash principle and the Luce and Raiffa concept of psychological dominance. Numerical values to which a new decision rule is applied are shown to be subjective probabilities, but only with certain prefixed conditions. (20 ref.)—*P. Hertzberg.*

5567. Mann, Leon & Taylor, Valerie A. (Harvard U.) **The effects of commitment and choice difficulty on predecision processes.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 221-230.—Tested a derivation from conflict theory that bolstering of choice alternatives (spreading apart of their value) will occur in the period preceding a decision when the choice is difficult but not committing. Ss (N = 100 female undergraduates) were sorted into easy and difficult choice conditions on the basis of their initial ratings of 2 art prints which later were offered as choice alternatives. Commitment was manipulated by telling Ss that their decision could or could not be reversed after they had announced their choice. An additional condition was run in which commitment was strengthened by warning Ss that they would have to write an essay to justify their choice. Ss confronted with a difficult choice bolstered more, took more time to announce their decision, and felt less certain than those with an easy choice. Ss in the commitment condition took longer to announce their decision and felt less certain than those in the no commitment condition. Bolstering occurred under conditions of commitment and no commitment, but not when Ss were told they would have to defend their choice.—*Journal summary.*

5568. Payne, John W. & Braunstein, Myron L. (U. California, Irvine) **Preferences among gambles with equal underlying distributions.** *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 13-18.—Explored the relative merit of risk dimension (probabilities of winning and losing, and amounts to be won or lost) and moment (expected value, variance, and skewness) explanations of decision making under risk, using pairs of specially constructed duplex gambles. Ss were 40 undergraduates. The explicit (displayed) probability values were different for each gamble in a pair, but the underlying distributions were identical. Preferences

among these gambles were related to relationships among the displayed probabilities. This supports the concept of gambles as multidimensional stimuli to which Ss respond on the basis of displayed values on a set of risk dimensions. A preliminary model of the decision process is presented in flow-chart form.—*Journal abstract.*

5569. Pollatsek, Alexander & Tversky, Amos. (U. Massachusetts) **A theory of risk.** *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 540-553.—Develops a psychological theory of perceived risk. The theory is formulated in terms of an ordering of options, conceived of as probability distributions with respect to risk. It is shown that, under the assumptions of the theory, the risk of an option is expressible as a linear combination of its mean and variance. The relationships to other theories of risk and preference are explored. (34 ref.)—*Journal abstract.*

5570. Rios, Sixto. **Modelos matemáticos de resolución de conflictos.** [Mathematical models of conflict resolution.] *Trabajos de Estadística y de Investigación Operativa*, 1969, Vol. 20(1), 3-15.—Discusses decision processes in conflict situations in which 2 or more parties are in a decision making position and the final result depends on the actions or attitudes they choose. Based on the theories of Borel and Von Neumann, it is proposed that mathematical abstractions may be made from game situations involving rules of play, an operator governing each player's role, and axioms of rational behavior for each player. Rational behavior and optimal strategy are considered in relation to possibilities of consequences. Cooperative and uncooperative game theories are defined. Examples of hypothetical instances where game theories could be applied to governmental and business decisions are included.—*P. Hertzberg.*

5572. Streufert, Siegfried. (Purdue U.) **Complexity and complex decision making: Convergences between differentiation and integration approaches to the prediction of task performance.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 494-509.—Conducted a series of 3 experiments designed to measure effects of environmental complexity (information load, failure, and success) and complexity of personality structure on differentiation and integration in decision making. 11 dyad teams participated in the tactical and negotiations game under each condition. It was found that increases in load, success, or failure produced initially increasing and then decreasing integration levels. Differentiation levels increased and then remained constant. Differentiation exceeded integration. 66 structurally complex Ss exceeded 66 structurally simple Ss in integration scores, but not in differentiation scores. It is concluded that complexity theories dealing with differentiation and those dealing with integration may not be viewed as equivalent or widely related. Common theoretical predictions for differentiation and integration are placed in doubt. (36 ref.)—*Journal abstract.*

5573. Tan, Allen L. & Ilan, Leila C. (U. Philippines, Manila) **Empirical tests of correspondent-inference theory: I. Non-commonality of effects and correspondence.** *Philippine Journal of Psychology*, 1969(Jun),

Vol. 2(1), 8-10.—Tested E. Jones and K. Davis' hypothesized relationship between the number of non-common effects in pairs of choice areas and correspondence. In 2 identical 3×3 Latin squares, 3 levels of noncommonality of effects were manipulated in 3 pairs of choice situations. 90 undergraduates were Ss. The resulting analysis of variance confirmed the hypothesis that correspondence relates inversely to noncommonality of effects. A significant interaction effect also suggests that this relationship depends, to some extent, upon the type of choice situation involved.—*Journal abstract.*

5577. **Gaaze-Rapoport, M. G. & Pospelov, D. A.** **Nekotorye analogii mezhdru strukturami povedeniya biologicheskikh i tekhnicheskikh sistem.** [Some analogies between the behavioral structures of biological and technical systems.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 24-30.—Analyzes the assumptions underlying the construction of technical systems, possessing elements of behavior appropriate to some biological objects.—*I. D. London.*

5578. **Glick, Stanley D. & Jarvik, Murray E.** (Albert Einstein Coll. of Medicine, Yeshiva U.) **Differential effects of amphetamine and scopolamine on matching performance of monkeys with lateral frontal lesions.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 307-313.—Administered d-amphetamine and scopolamine to 4 monkeys with dorsolateral frontal lesions and 4 unoperated monkeys performing a delayed matching task. Although initially impaired following surgery, the performance of the frontal Ss on the delayed matching test had recovered to preoperative levels by the time of drug administration. Both drugs impaired the delayed and nondelayed matching performance of the unoperated controls. However, only scopolamine impaired the matching performance of the frontal Ss. The higher doses of both drugs initially decreased the tendencies of both the frontal and unoperated Ss to respond to the test stimuli. It is proposed that frontal Ss, unlike normals, learn to depend upon a nonadrenergic system to solve the

matching task and therefore are resistant to certain actions of amphetamine. (25 ref.)—*Journal abstract.*

5579. **Ivannikov, V. A.** (Moscow State U., USSR) **Orientirovochnaya reaktsiya kak reaktsiya prednastroiki pri neopredelennosti situatsii.** [The orienting reaction as preredying reaction when the situation is uncertain.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 149-158.—20 18-26 yr. old Ss participated in a study of speed of extinction of the different components of the orienting reaction as a function of degree of situational uncertainty and character of the organism's actions. EEGs recorded the electrical activity of the occipital, parietal-occipital, and motor areas of the cortex of both hemispheres; EMGs that of the ulnar extensors of both hands or the deep flexors of the fingers. GSRs were recorded from the foot. In 2 series of experiments, 2 photic signals ($p_1 = 1$, $p_2 = 0$; $p_1 = .5$, $p_2 = .5$) were presented 8-15 sec. apart, each eliciting a motor reaction in the appropriate hand. The data lead to the view that the orienting reaction is not merely a simple reflex, but a complex adaptive reaction under special conditions where uncertainty of prognosis exists.—*I. D. London.*

5580. **Kovach, Joseph K.** (Menninger Foundation, Topeka, Kan.) **Development and mechanisms of behavior in the chick embryo during the last five days of incubation.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 392-406.—Studied prehatching motility and prenatal postural reflexes, their involvement in prehatching turning and hatching behavior, and their possible developmental continuity with postnatal righting behavior by visual observation of 400 Rhode Island Red chicks and chick embryos and by electronic recording of their movements from fenestrated and intact incubating eggs. Data on the pattern, mechanisms, and development of prenatal motility suggest developmental continuities between the coordinated rotatory movements of the embryo that begin to appear on Day 17 of incubation and culminate in hatching and postnatal righting behavior. The prehatching turning phenomenon, in which the embryo takes up a spatial orientation that enables pipping in the upper surface of the egg, and the turning behavior during hatching were not found to be related. Contrary to earlier postulates, the former appears to be a passive reaction to gravity without the involvement of active behavioral factors.—*Journal abstract.*

Coll.) **Effect of an "overload" concentric training of the quadriceps on strength and limb circumference in females.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 563-568.—For 37 college-aged females measurements, including body weight, standing height, thigh circumference, and isometric quadriceps strength, were determined before and after an 8-wk progressive resistive exercise program. Thigh circumference changes of the average-weight Ss were compared with those of overweight Ss. The average-weight Ss showed small increases in thigh circumference whereas the overweight Ss showed small decreases.—*Journal abstract*.

5584. Murawski, Benjamin J. & Jones, Kenneth J. (Harvard Medical School, Boston, Mass.) **Correlation of somatic, biochemical, perceptual, and Rorschach data on 40 healthy male subjects.** *Psychophysiology*, 1970(May), Vol. 6(6), 761-772.—Used canonical correlation to investigate the interrelationships between somatic, biochemical, and psychological variables in 40 healthy male undergraduates. 4 roots (or factors) were extracted which demonstrated overlap in 4 sets of variables: (a) somatic (height, weight, body volume, body surface area); (b) biochemical (adrenal steroids, pepsinogen, creatinine, urine volume); (c) perceptual (Embedded Faces, Stroop Test, Time Estimation, Flicker Fusion); and (d) Rorschach indices. The first root linked style of spatial orientation with height. The 2nd factor extracted major loadings for all sets of variables and was dominated by big body size, high and variable biochemical values, and low perceptual control. The final factors were less well defined. Genetic or constitutional forces could be inferred and the interaction of personality, biochemical, and somatic variables was demonstrated. (36 ref.)—*Journal abstract*.

5585. Saltzberg, Bernard. (Tulane U., Medical School) **Circadian rhythms: A model for the interpretation of multimodal circadian spectra.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 121-123.—Postulates a nonlinear circadian model as the underlying process in the generation of biological data containing several significant non-24-hr rhythms. The model attributes observed multimodal dispersion to the nonlinear influence of processes which modulate the circadian rhythm, but which are very slow compared to 24-hr processes, and provides quantitative estimates of the period of this slow modulation, as well as the period of the basic circadian rhythm. Under this model, circadian data previously presumed to be anomalous gives a consistent derived basic rhythm of about 24 hr.—*Journal abstract*.

5586. Thayer, Robert E. (California State Coll., Long Beach) **Activation states as assessed by verbal report and four psychophysiological variables.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 86-94.—Examines the validity of controlled verbal reports of various activation states. A difference score design was used in which 4 psychophysiological measures and verbal ratings of various activation states were obtained in a base line and an activation period from 41 female undergraduates. Verbal reports were then correlated with individual physiological measures and composites or indices of physiological measures. Specifically, 2 kinds of physiological index were employed, 1 in which the S's physiological change score was represented by the single system showing the greatest change, and a 2nd index weighted equally by all 4 physiological measures. The physiological index using the single system showing the greatest activation yielded slightly greater correlations

with verbal report than the other index. Skin conductance and heart rate, the best combination of the 4 physiological systems measured, correlated as high as .62 with verbal report. Results demonstrate the usefulness and validity of controlled self-report and the relative superiority of skin conductance and heart rate among other physiological systems in correlations with verbal report.—*Journal abstract*.

5589. ———, Vladimir Konstantinovich Krasuskii. *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 551.—Recounts the life and work of V. K. Krasuskii (1904-1968) known for his research in the "physiology of types of higher nervous activity."—*I. D. London*.

5590. Badalov, L. I. (1st Medical Inst., Leningrad, USSR) **K mekhanizmu vosstanovleniya zapasov adrenergicheskogo mediatora v aksonal'nykh okonchaniyakh.** [On the mechanism underlying the restoration of adrenergic mediator stores in axonal termini.] *Fiziologicheskii Zhurnal SSSR*, 1966(Jan), Vol. 52(1), 29-33.—16 dogs were Ss in a study to determine the possibility of restoring sympathetic influence on the smooth muscle (m. retractor penis) through (a) reduction of the adrenergic mediator in the axonal termini after reserpine-induced depletion of stores thereof and adrenocortical ablation, and (b) utilization by the axonal termini of noradrenaline injected into the blood stream. Excitatory transmission from the adrenergic nerve to the smooth muscle can be excluded through prior extirpation of the adrenal cortex and reserpine injection. Exclusion of synaptic transmission of excitation probably occurs as a result of depletion of the mediator. The restoration of synaptic transmission of excitation occurred 4 hr. after reserpine administration. Prolonged stimulation of the sympathetic motor nerve after reserpine administration hindered the restoration of sympathetic transmission of excitation, leading to the view that such restoration depends in some measure on the reduction of the mediator along the axons of the peripheral segment of the sectioned nerve. Noradrenaline administration in small doses exerted no influence on the restoration of excitatory transmission (at least in the 1st 15 min. following injection). The administration of noradrenaline in large doses restored the neuromuscular transmission of excitation immediately after its injection. With large concentrations of noradrenaline in the blood, the axonal termini appeared capable of its rapid assimilation and utilization in the capacity of mediator.—*I. D. London*.

5591. Boush, R. L., Ovsyannikov, A. V., & Farfel', V. S. (State Inst. of Physical Culture, Moscow, USSR) **Rol' sustavnoi afferentsii v razlichnykh rezhimakh myshechnogo sokrashcheniya.** [The role of articulatory afferentiation under different schedules of muscular contraction.] *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 712-713.—Attempted to determine whether

the function of the articulatory receptors is that of only signalization concerning position and movement in the joint or whether their afferentiation is utilized also for regulation of muscular tension. Ss were 13 athletes, previously trained to (a) estimate passive positioning involving the elbow and its active positioning to a given angle, and (b) reproduce a definite magnitude of muscular tension (10-15% of maximum possible) under isometric and auxotonic conditions. Novocainization was used to exclude sensitivity of the elbow joint. The data support the possibility of participation of articulatory afferentiation in the regulation of muscular tension.—I. D. London.

5592. Bresler, David E. & Bitterman, M. E. (U. California, Los Angeles) **Learning in fish with transplanted brain tissue.** *Science*, 1969(Feb), Vol. 163(3867), 590-592.—Implanted material taken from fish embryos (the African mouth-breeder) during gastrulation at prospective tectal sites in host embryos of the same age and species. When mature, the hosts were trained in a series of habit reversals. 2 of 6 Ss showed progressive improvement in reversal (a phenomenon not typically found in fish, but characteristic of higher animals), 2 showed unusually few errors, and 2 behaved normally. Differences in performance were correlated with differences in brain structure.—*Journal abstract.*

5593. Efimova, G. V. (Inst. of General & Educational Psychology, Moscow, USSR) **O rol' yavlenii summatsii vzbuzhdeniya v mekhanizmakh umstvennogo sopostavleniya.** [On the role of excitation summation phenomena in mental comparison mechanisms.] *Voprosy Psikhologii*, 1970(Jul), Vol. 16(4), 65-76.—11 university students were given several variants of a task in which they had to determine which 1 of 4 switches would turn on 1 of 4 lamps. Various combinations of signal lights and verbal instructions were used to structure each task. The purpose was to establish the role of neural summation in mental comparison. It is concluded that an increase in neural excitation corresponding to the lamp common to 2 lamp circuits occurred as a result of neural summation from excitation in the 1st and 2nd signal systems. Training trials indicated that when uniform reactions were required of both signal systems, performance was better than when divergent reactions were required. This is interpreted as a positive effect of the summation phenomenon on mental comparisons. The nature of errors made when the reactions were divergent indicates that summation in the 1st signal system is artifactual and affects Ss' performance adversely. (English summary) (31 ref.).—L. Zusne.

5594. Evans, C. R. & Mulholland, T. B. (National Physical Lab., Div. of Computer Science, Teddington, England) **Attention as a concept in neurophysiology.** *Science*, 1969(Jan), Vol. 163(3866), 495-496.—Reviews findings of a conference on neurophysiological aspects of the psychological concept of attention. Issues examined include: (a) relation of visual control systems to EEG occipital alpha rhythm, (b) evoked responses, (c) the role of the reticular activating system in the acquisition of CRs, and (d) habituation of response from single cells in brain and behavioral reactions.—P. McMillan.

5595. Gatev, V. A. & Ivanov, I. A. (Research Inst. of Pediatrics, Sofia, Bulgaria) **Vliyanie nagruzki na fiziologicheski poznyi tremor.** [Influence of loading on physiological positional tremor.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1450-1456—8 18-35 yr. old Ss participated in a tensometric study of the

influence of loading on positional tremor of the hand with respect to the forearm without and with loading (up to 1500 gm. plus weight of hand) when assuming and maintaining definite positions on command, in order to determine the origin of the tremor. With minimal loading or with top loading, the tremor decreased and in several cases disappeared. With unilateral activation of muscle antagonists, the amplitude and amplitudinal variability of the tremor were less than was the case with bilateral activation, while form and rhythm were closer to the norm. It is suggested that physiological positional tremor has an alpha-motoneuronal origin. (English summary) —I. D. London.

5596. Goldstein, Steven G. (U. Oregon, Medical School) **Strategies of research in human neuropsychology.** *Journal of Learning Disabilities*, 1969(Aug), Vol. 2(8), 403-406.—Argues that studies in human neuropsychology often fall prey to criterion problems because of a dependence on construct validity, and that such criteria are inappropriate and that only empirical criteria have some claim to validity in this area of research. The question of appropriate experimental designs is discussed and it is recommended that non-parametric statistics be employed in such designs.—*Journal abstract.*

5597. Gordon, Malcolm W. (Norwich Hosp., Abraham Ribicoff Research Center, Conn.) **Neuronal plasticity and memory.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 578-594.—Discusses neuronal plasticity as a widespread and general property of the neuron, going beyond the limitations that Pavlov thought were present. It is suggested that changes in response are intimately associated with use, and that genetic determination may play a smaller role than previously believed. All of the somatic therapies useful in psychiatry modify synaptic membrane activity. Means by which pathways can be selectively activated or deactivated, through learning or chemical interventions, may be discovered in future research. A chemical-functional model which may become possible as a basis for modification of behavior is outlined. (65 ref.) —*Journal summary.*

5598. Jacobson, Marcus. (Johns Hopkins U.) **Development of specific neuronal connections.** *Science*, 1969(Feb), Vol. 163(3867), 543-547.—Presents evidence for a theory dealing with an ontogenetic view of neuronal connectivity. In this view modifiability of neuronal connections in the adult is regarded as a continuation of developmental processes that are much more pronounced in the embryo. (27 ref.)

5599. Kaas, Jon; Hall, W. C., & Diamond, I. T. (U. Wisconsin, Lab. of Neurophysiology) **Cortical Visual Areas I and II in the hedgehog: Relation between evoked potential maps and architectonic subdivisions.** *Journal of Neurophysiology*, 1970(Sep), Vol. 33(5), 559-615.—Microelectrodes or surface macroelectrodes were used to record from the cerebral neocortex in 18 hedgehogs (*Eriacus europaeus*). Visual Area I occupies the caudal pole of the cerebral hemisphere and V II forms a narrow band on the lateral border of V I. Visual Areas I and II correspond to 2 architectonic areas, striate cortex and an adjacent belt, respectively. The cortex immediately lateral to V II responds to auditory stimuli, while the area immediately rostral to V I and V II is activated by mechanical stimulation of the body surface.—G. Westheimer.

5600. Kalinina, M. K. & Alyukhin, Yu. S. (Pavlov Inst.

of Physiology, Leningrad, USSR) **Potreblenie mozgom kisloroda v zavisimosti ot ego napryazheniya.** [Cerebral consumption of oxygen as a function of its tension.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1481-1486.—Ss were unnarcotized white rats in a study comparing (a) the absolute magnitude of oxygen tension (pO_2) in cerebral venous blood and in the cerebral tissue itself with (b) the absolute magnitude of cerebral O_2 consumption, given normal and decreased (10, 7.5, 6% O_2) content of O_2 in the air being breathed. Under normal conditions, mean O_2 consumption of the whole brain was 58 microliters/gm/min and that of the gray matter 79 microl/gm/min. The pO_2 of cerebral venous blood was 39-mm Hg; the lowest pO_2 in brain tissue, 23-mm Hg. The lowering of cerebral venous pO_2 down to 24-26 mm. Hg was accompanied by a twofold increase in cerebral blood flow, but cerebral O_2 consumption was maintained at the normal level. The critical value of cerebral tissue pO_2 , at which diminution in cerebral O_2 consumption began was established as at 8-10 mm. Hg. (English summary) (22 ref.).—*I. D. London.*

5601. Karpukhina, A. M. & Ponomareva, I. D. **O dvukh vidakh funktsional'nykh pokazatelei pri issledovanii dykhatel'nykh neuronov.** [On two forms of functional indices in the study of respiratory neurons.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 147-158.—Analyzes the electrophysiological indices of respiratory neurons. These indices can be divided into 2 groups—the invariant and the variable. Among the latter are: duration of neuronal discharge, number of impulses in a discharge, frequency-configuration of the discharge, and some others. The estimate of interneuronal interactions, as determined by the "logico-probability method," belongs to the invariant group. Conclusions are drawn concerning the functional significance of the different parameters analyzed.—*I. D. London.*

5602. Khayutin, V. M. & Chernilovskaya, P. E. (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Khemochuvstvitel'nost' volokon dorsal'nogo koresha k ionam kaliya i glipoteza o perifericheskom mekhanizme boli.** [Chemoreactivity of dorsal root fibers to K-ions and the hypothesis of a peripheral mechanism of pain.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 3-6.—Used cats with sectioned dorsal spinal root L_1 to show that K ions are capable of exciting dorsal root fibers, producing "nociceptive reflexes." The threshold concentration for this effect is 20 mm/1, which is lower than that for the epicardial and small intestinal reflexogenic zones. Data suggest that the emergence of nociceptive reactions was due to excitation of the fine unmyelinated fibers, and not to special pain receptors.—*I. D. London.*

5603. Kolpakov, V. G. (Inst. of Cytology, Novosibirsk, USSR) **Issledovanie aktivnosti karboangidrazy krovi i mozga ustoichivyykh k zvuku i predraspolozhennykh k audlogennoi epilepsii belykh kry.** [Study of the activity of hematic and cerebral carboanhydrase in white rats resistant to sound and in those predisposed to audiogenic epilepsy.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 353-356.—The activity of hematic carboanhydrase in epileptic Ss was higher than in normal Ss, due apparently to a higher erythrocytic concentration in the blood. In epileptic Ss the activity of cerebral carboanhydrase was reduced. As the hemoglobin content in brain preparations was also reduced, it was assumed that this was due to a disturbance in cerebral blood supply; while reduction in the activity of cerebral

carboanhydrase reflected a smaller admixture of blood in the brain preparations of epileptic Ss.—*I. D. London.*

5604. Kováč, Damián & Horković, Gabriel. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **How to measure lateral preference: II.** *Studia Psychologica*, 1970, Vol. 12(3), 169-178.—Emphasizes methods in the area of complex responses, performance, and personality. Besides practical activities raised to the level of tests (use of scissors, writing one's name, etc.) special attention is devoted to laboratory measurements (simultaneous promptness, latoscope, tachistoscopic decoding of words, etc.). Measurements from the area of personality involve bioelectric skin reactivity patterns, neuroticism, anxiety, etc. Methods recommended in the study are reviewed concerning their use in research. Various hypotheses and concrete aims are outlined. (Czech & Russian summaries) (16 ref.).—*Journal abstract.*

(50 ref.).—*I. D. London.*

5606. Larionova, L. A. **Issledovanie protsessov rasprostraneniya aktivnosti v neironnoi seti s peremennymi vzbuzhdayushchimi i tormozyashchimi svyazyami.** [Study of the processes involved in propagating activity in the neuronal network with alternating excitatory and inhibitory connections.] *Problemy Bioniki*, 1970, No. 3, 98-107.—Investigated an excitable medium in the form of a flat neuronal network. The function of the network is always directed to maintaining at an optimal level certain characteristics of the neuron—"internal potential"—for each neuron. The neurons in the network are tied together by means of excitatory and inhibitory connections. The magnitudes and number of connections may be changed during the operation of the network. In the course of changing the magnitudes and the number of connections, the network undergoes training. The model is presented in the form of a computer program.—*I. D. London.*

5607. Magazanik, L. G. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **O mekhanizme vliyaniya diethylaminoethyl'ovogo élfra difenilpropilakusnoi kisloty (SKF-525A) na nervno-myshechnye sinapsy.** [On the mechanism mediating the influence of diethylaminoethyl ether of diphenylpropylacetic acid (SKF-525A) on neuromuscular synapses.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 10-14.—Isolated frog neuromuscular preparations of n. ischiadicus-m. sartorius, immersed in a solution of the potentiator, SKF-525A, in concentrations of 1.10^{-5} - 1.10^{-4} , were used in a micro-electrophysiological study of the influence of SKF-525A on neuromuscular synapses. The fact that, underlying the neuromuscular block brought on by depolarizing types of myorelaxants, exists desensitization of the postsynaptic membrane to mediator action was considered. While SKF-525A did not influence the amplitude of end-plate potentials, it did shorten to $1/2$ maximal amplitude. After inhibition of cholinesterase by proserine in the synapses, SKF-525A (2.10^{-5} - 3.10^{-5} M)

reduced the amplitude of end-plate potentials. In much smaller concentrations, SKF-525A suppressed responses to microionophoretic application of acetylcholine to end plates. A marked increase in desensitization to the action of acetylcholine was noted. It is thought that SKF-525A increases the desensitization of the postsynaptic membrane, influencing later changes in ionic permeability rather than on the cholinergic receptors. Increase of desensitization may be at the basis of the mechanisms controlling the potentiating action of SKF-525A considering the effects of depolarizing muscle relaxants.—*I. D. London.*

Describes the "algorithm for an optimal formal neuron in accordance with a given threshold schedule."—*I. D. London.*

5610. **Murphy, E. H. & Venables, P. H. (Stanford U., Medical School) Effect of contralateral shock stimulation on laterality differences in the two shock threshold.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 475-477.—Contralaterally presented shock was found to bring about marked changes in 2 shock threshold determined for the right but not for the left finger. Shock consisted of square pulses, 1 msec. in duration. Results are discussed in terms of a suggestion that the level of excitability of the left hemisphere may be more easily disturbed than that of the right hemisphere.—*Journal abstract.*

5611. **Ovsyannikov, A. V. & Khomyakova, G. D. (All-Union Research Inst. of Physical Culture, Moscow, USSR) Dvigatel'naya prednastroika u cheloveka v usloviyakh vybora.** [Motor priming in man under conditions of choice.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 525-527.—Results based on data from 7 athletes show that, in Phases II and III of the latent period of the motor (leg) reaction to a visual signal, a certain functional priming of the segmental apparatus of the spinal cord occurred. Phase I was the interval of time from presentation of visual signal to 60 msec. before movement; Phase II, from 20-30 to 60 sec. before movement; and Phase III, the last 20-30 sec. before movement. Under certain priming conditions observed in Phase II, the priming bore a generalized character which evidently represents a "nonspecific" component of priming for future movement. There is basis for thinking that, for the organization of movement under conditions of choice, the higher nervous centers (sensorimotor cortex) utilize some suprasegmental intercalary system (e.g., the reticular formation and/or the calary system), involving a diffuse priming of spinal red nucleus), involving a diffuse priming of spinal pathways, in Phase III of the latent period—influences directly effecting voluntary movement. Securement of postural readjustment also enters into the function of the

intercalary neuronal system. Postural priming of the activity of the muscles of the lower extremities occurred in a standing man 30-50 msec. before voluntary movement. By the 2nd-3rd day, priming of the spinal segmental apparatus before movement in an aqueous medium was observed only in Phase III with its absence in Phase II.—*I. D. London.*

5612. **Potapov, V. I. Voprosy sinteza optimal'nykh funktsional'no gibkikh setei na formal'nykh neironakh.** [Problems in the synthesis of optimal, functionally flexible networks in formal neurons.] *Problemy Bioniki*, 1970, No. 3, 88-97.—Describes several properties of optimal, functionally flexible neuronal networks. The concept of the "basis of the set of all optimal, functionally flexible networks of delta variables" is introduced. Transformations are introduced to facilitate the process of synthesizing networks not included in the basis.—*I. D. London.*

5613. **Pozin, N. V. (Inst. of Automation & Telemechanics, Moscow, USSR) Gipoteza o mekhanizme polska i protoreniya putei v neironnoi seti.** [Hypothesis on the mechanism for search and for the formation of pathways in the neuronal net.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 343-352.—Presents a hypothetical mechanism based on known data on neurons and neuronal interaction. The mechanism for search utilizes 2 neuronal relays, the ratio of whose velocities determines the direction of search. Search is initiated after excitation of 1 stratum of input neurons. "Under search is understood the process of seeking out from among the output neurons 1 of which is connected with an effector, capable of compensating for or abolishing external influence." After attainment of the indicated goal, search is terminated. However, the act, itself, of compensating for external influence does not stop with this. For its continuation and performance, the formation of a stable connection between centers receiving input (afferent) signals and emitting output (efferent) signals is necessary. At the basis of such formation is an increase in the strength of connections between simultaneously excited neurons.—*I. D. London.*

5614. **Salas, Manuel; Schapiro, Shawn; & Guzman-Flores, Carlos. (Veterans Administration Hosp., Developmental Neuroendocrinology Lab., San Fernando, Calif.) Development of olfactory bulb discrimination between maternal and food odors.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1261-1264.—30 Wistar rats served as Ss. Electrical activity at 2 days of age was undetectable and both odors were without effect. From 6-30 days of age, there was a progressive discrimination between maternal odor and that of food as reflected by differential changes in all parameters of electrical activity studied. Results indicate that, during development, specific olfactory cues evoke characteristic olfactory bulb electrical changes which correlate with the expanding behavioral repertoire of the organism. Maternal odor recognition may be integrated earlier in the subcortical-rhinencephalic structures while recognition of food related odors occurs later and requires neocortical participation. These observations support a previous suggestion that during the early postnatal period odor from the maternal surround leads to a type of olfactory imprinting which later serves to identify and orient species members appropriately to each other. (16 ref.)—*Journal abstract.*

5615. **Tokarenko, I. I. (Medical Inst., Zaporozh'e, USSR) Soderzhanie nukleinykh kislot v nervnykh**

kletkakh kory golovnogo mozga pri sryve vysshei nervnoi deyatel'nosti. [Nucleic acid level in nerve cells of the cerebral cortex during breakdown of higher nervous activity.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 692-697.—Ss were 4 dogs, with electrodefensive-motor CRs to acoustic and photic stimuli, in a quantitative cytospectrophotometric study of nucleic acid level in the cells of different cortical zones (auditory, visual, motor, parietal) following breakdown of higher nervous activity due to the action of an intense sound of long duration (500 cps, 94 db.). Under the latter condition, a drop in total nucleic acid level was observed in the cortical points of the CRs and in the cortical representative of the defensive-motor CR. The decline was stable and was not made up for by synthesis of the nucleic acids. Selectivity with respect to different zones of the cerebral cortex was observed in the decrease of nucleic acids—the sharpest decrease being in the cortical cells of the auditory analyzer. Individual differences in degree of decline of cortical nucleic acid level were noted. Comparison of morphological data with the cytospectrophotometric indicates that the decline of nucleic acid level in the cortical cells under acoustic action occurred because of the functionally labile cytoplasmic RNA; simultaneously with this decrease, an increase was noted in the volume of the nerve cells along with hypertrophy of the nucleoli and an increase of RNA therein.—I. D. London.

5616. Tolkunov, B. F. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) *Izmeneniya vyzvannoi aktivnosti neuronov kory bol'shikh polusharii i retikulyarnoi formatsii krys pri funktsional'nom vyklyuchenii khvostatogo* [Changes in evoked neuronal activity of the rat cerebral cortex and reticular formation with functional exclusion of the caudate nucleus.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 488-494.—Immobilized unanesthetized white mice were used to study the influence of caudate nuclear exclusion on neuronal impulse activity in the parietotemporal areas of the cerebral cortex, and the reticular formation at the pontine level (making use of "spreading depression"). During exclusion of the caudate nucleus, marked tonic inhibitory influences continued without diminution. The effect of this exclusion was manifested in changes of another kind encountered in neuronal responses to stimulation of the sciatic nerve and in the transformation of the statistical structure of impulse activity. The most frequent form of neuronal reaction to exclusion of the caudate nucleus was a decrease in responses to stimulation along with simultaneous decrease in the frequency of spike discharges. In those cases where stimulation of the sciatic nerve changed the character of the temporal or serial relationship between neuronal discharges, exclusion of the caudate nucleus frequently decreased the magnitude of such changes. The data indicate the great diversity of the regulatory influences of the caudate nucleus and do not support the view that its structure is purely inhibitory in nature.—I. D. London.

5617. Trifonov, E. V. (Kirov Military-Medical Academy, Leningrad, USSR) *Statisticheskaya kontrol'ruemost' protsessa kak pokazatel' postoyanstva uslovii pri rabote s polozhitel'nymi uslovnymi refleksami*. [Statistical verifiability of a process as an index of the constancy of conditions in work with positive conditioned reflexes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 587-592.—Presents an

application of the methods of quality control to research on higher nervous activity, and maintenance of the constancy of experimental conditions in studies of positive CRs.—I. D. London.

Neuroanatomy

5618. Pribram, Karl H. *The neurophysiology of remembering*. *Scientific American*, 1969(Jan), Vol. 220(1), 73-86.—Reviews experiments with monkeys investigating brain areas involved in the recall of various learned tasks. It is suggested that input into the brain is transformed by coding and recoding operations, essential in both memory storage and remembering. "These transformations generate a microstructure of post-synaptic events, which can be regarded as wave fronts that set up interference patterns with other (preexisting or internally generated) wave fronts, producing in their totality something resembling a hologram." For more complex and novel events, the "function of the association areas of the [cerebral] cortex turns out to be that providing a major part of the organizing process necessary to remembering: the reconstruction of an image from distributed mnemonic events."—P. McMillan.

5620. Blum, S. L. & Thiessen, D. D. (Stanford U., Medical Center) *Effect of ventral gland excision on scent marking in the male Mongolian gerbil*. *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 461-464.—Midventral scent glands of 12 gerbils were excised; nonglandular skin strips of 12 were excised; 12 received midline incisions through their glands but remained intact; and 12 received no operation. Groups did not differ in frequency of marking (rubbing the ventral area on floor pegs) during 5-min tests. In a subsequent study, 14 gland- and skin-excised Ss did not differ in the temporal distribution of marking over 7-min test periods. Prior marking experience did not affect results. Apparently, marking behavior is not regulated by some aspect of the gland. Implications for the nature of the hormonal control of marking are discussed.—*Journal abstract*.

5621. Makarenko, N. V. (Bogomolets Inst. of Physiology, Kiev, USSR) *Uslovnoreflektornaya deyatel'nost' krys, tireoidektomirovannykh v razlichnye periody ontogeneza*. [Conditioned reflex activity of rats, thyroidectomized at different periods of ontogenesis.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 432-440.—61 Ss were subjected to positive and differentiated motor-alimentary CRs to acoustic stimuli. Extirpation of the thyroid gland in 1-mo-old male Ss slowed down the formation of CRs and lengthened the latent period of the reactions. CRs gradually extinguished toward the 50th day after thyroidectomy. Extirpation of the thyroid gland in sexually mature male Ss made it impossible to elaborate stable CRs, increased the latent period, led to the frequent failure of emergence of the positive CR, and decreased general motor activity. However, no marked disturbances of CR activity were observed in thyroidectomized female Ss. The application of hormonal substitutive therapy to thyroidectomized Ss led to complete restoration of CRs and all previously

impaired functions of the organism. When thyroidine was no longer injected, the normalizing effect disappeared.—*I. D. London.*

5622. **Spryskova, N. A.** (Research Inst. of Human Morphology, Moscow, USSR) **Vliyanie total'noi i subtotal'noi tireoidéktomii na rost perevivnoi mul'tiformoi glioblastomy mozhechka krys.** [Influence of total and partial thyroidectomy on the growth of transplantable multiform glioblastoma of the rat cerebellum.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 95-97.—Studied 64 white rats to determine the effect of hypo- and athyroid states on the growth of transplantable multiform spongioblastoma in the cerebellum. Total and partial thyroidectomy led to prolongation of the incubation period and delayed the Ss' death.—*I. D. London.*

5623. **Stern, Jeffrey J.** (U. Michigan, Dearborn) **The effects of thyroidectomy on the wheel running activity of female rats.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1277-1279.—Observed the wheel running activity of 12 virgin albino female rats prior to and following thyroidectomy. Thyroidectomy of 9 Ss significantly reduced overall activity and increased the interval between activity peaks; thyroid feeding corrected these effects. Thyroid feeding did not correct the effects in 6 ovariectomized Ss. The continued administration of estradiol benzoate and progesterone increased activity in ovariectomized-thyroidectomized Ss. Results suggest that the activity reduction consequent to thyroidectomy is not a direct result of thyroid removal but an indirect result mediated by altered ovarian functioning.—*Journal abstract.*

A.** (Research Inst. of Defectology, Moscow, USSR) **Vliyanie zritel'noi deafferentsii na pryamoï korkovyï otvet.** [Influence of visual deafferentiation on the direct cortical response.] *Zhurnal Vyssheï Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 635-643.—Studied the response of the visual and sensorimotor cortex to direct stimulation of its surface in 20 rabbits, 4-16 mo. after bilateral enucleation in 10 of them (6 subjected to enucleation 7-8 days after birth before opening of the eyes; 4 at the age of 5-7 mo.), in order to determine the mechanisms involved in the changes produced by visual deafferentiation in the summated EEG. It was hypothesized that the EEG waves and the primary negative wave of the direct cortical response are due to summation of the post-synaptic potentials, generated by axodendritic synapses in the apical dendrites of the pyramidal neurons. A significant decline of amplitude (by 56.5%) and reduction of duration (by 27%) of the primary negative phase of the direct cortical response were demonstrated in the visual cortex of the blinded Ss in comparison with intact Ss. A decrease in amplitude of the secondary positive wave appeared in blinded Ss, in comparison with intact Ss, only when stimulation of great intensity was applied, and did not exceed 17%. The amplitude of the negative wave of the direct cortical response in the sensorimotor cortex of the blinded Ss was lower by 20% on the average than that in intact Ss. The hypothesis is advanced that the reduction of the negative wave of the direct cortical response under influence of visual deafferentiation is due partly to atrophy of nerve elements in the cortical projection zone, and weakening of synaptic action in the intact synapses owing to the elimination of the flow of visual impulsations from the specific and nonspecific afferent systems.—*I. D. London.*

5627. **Belenkov, N. Yu. & Goreva, O. A.** (Kirov Medical Inst., Gorki, USSR) **Rol' zadnikh bugrov chetverokholmiya v osushchestvlenii orientirovannogo refleksa.** [Role of the posterior colliculi in effecting the orienting reflex.] *Zhurnal Vyssheï Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 453-461.—15 cats with bilateral lesions of the posterior colliculi and 11 controls were used to study the influence of such lesions on the manifestation and extinction of the orienting reflex to clicks both as a whole and with respect to its individual components. Lesion of the posterior colliculi produced a sharp weakening, up to the point of complete disappearance, of the motor component of the orienting reflex in the 1st postoperative mo. Other components under study (EEG, cardiac, respiratory, GSR) did not change. The manifestation of the components of the orienting reflex to a photic stimulus in the surgically treated Ss was the same as for normal Ss. Lesion of the posterior colliculi changed the course of extinction of the orienting reflex to acoustic stimuli. Extinction of the somatic (EMG) component occurred more rapidly than in normal Ss, while the autonomic and EEG components extinguished slowly. The differences, observed in the manifestation and extinction of the orienting reflex in lesion of the posterior colliculi, point to the complex morphofunctional organization of this reflex, and the differential participation of different structures of the brain in its manifestation and extinction. The disturbance that occurred in the elaboration of CRs and in the spatial analysis of sounds of the posterior colliculi lesioned Ss was connected with a decrease in the somatic component of the orienting reflex, necessary for the localization of acoustic stimuli.—*I. D. London.*

5629. **Clark, Carol V.** (Veterans Administration Hosp., Denver, Colo.) **Effect of hippocampal and neocortical ablation on scopolamine-induced activity in the rat.** *Psychopharmacologia*, 1970, Vol. 17(4), 289-301.—Scopolamine was administered to naive male Holtzman albino rats with hippocampal (N = 27) or

cortical ($N = 27$) lesions and to 2 control ($N = 27$ each) groups. At drug doses of .2 and 1 mg/kg rats with hippocampal or cortical lesions had significantly greater activity than the sham operates. A group of Ss with electrolytic hippocampal lesions tested at .2 mg/kg scopolamine had transitory activity increases. Thus, the hippocampus is not necessary for the motor activating effects of the drug, nor is its ablation unique in producing increases in drug-induced activity.—*P. Federman*.

5630. Cohen, Jerome S. (U. Windsor, Ontario, Canada) **Exploration in the hippocampal-ablated albino rat.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 261-268.—16 male albino Holtzman rats with bilateral neocortical and hippocampal damage (HIPP group) explored a side alley off a straight runway much less frequently than 12 neocortical-ablated (CORT group) or 12 unoperated control Ss (NORM group) under conditions of reinforced and nonreinforced straight running. Changes in side-alley location failed to distract HIPP Ss from running down the straight runway. The NORM Ss decreased exploration to the same side alley but increased exploration to a novel-located side alley. The lack of exploration increase to the novel side alley in CORT Ss suggests that neocortical and slight hippocampal damage was sufficient to cause distraction deficits. When exploratory activity in the side alley was controlled, normal Ss ran faster down the main runway than brain-damaged Ss. (19 ref.)—*Journal abstract*.

5631. Dalby, David A. (U. North Carolina) **Effect of septal lesions on the acquisition of two types of active-avoidance behavior in rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 278-283.—Trained 40 normal male albino rats and 40 rats with lesions of the septal region of the forebrain to a criterion of 9/10 avoidance responses in a 2-way conditioned avoidance response (CAR) habit and in a free-choice CAR task. Ss with septal lesions were retarded in learning the 2-way but not the free-choice problem, made more intertrial responses in both situations, and showed a greater tendency to avoid entering a location from which they had just escaped in the free-choice task. It is suggested that Ss with septal lesions are more fearful than normal controls. Differences in these results and those of previous experiments are discussed from the standpoint of this interpretation. (25 ref.)—*Journal abstract*.

(Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Novyi sposob stereotaksicheskoi orientatsii golovnogo mozga krolika.** [New method for stereotaxic orientation of the rabbit brain.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1501-1504.—Describes and analyzes a new method for stereotaxic orientation of the rabbit brain which is free of preliminary selection of the rabbit with respect to age, weight, and the distance between the 2 conventional points of reference—beta and lambda.—*I. D. London*.

5633. DiCara, Leo V., Braun, J. Jay, & Pappas, Bruce A. (Rockefeller U.) **Classical conditioning and instrumental learning of cardiac and gastrointestinal responses following removal of neocortex in the rat.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 208-216.—Used a total of 40 normal and 40 neocorticate male albino Sprague-Dawley rats, paralyzed by d-tubocurarine, in 2 ex-

periments. Different groups of Ss received instrumental training and classical conditioning of either heart rate or intestinal activity. A control group consisted of Ss receiving random presentations of the CS and UCS used in the classical conditioning experiment. Results indicate that the intact neocortex is necessary for the instrumental learning of cardiac and gastrointestinal responses, but that it is not necessary for the classical conditioning of these responses. No relationship could be discerned between the cortical lesions, which included over 90% of the neocortex, and the extent of cardiac or gastrointestinal change achieved by either classical or instrumental training paradigms. (19 ref.)—*Journal abstract*.

5634. Glass, David H., Ison, James R., & Thomas, Garth J. (Veterans Administration Hosp., West Haven, Conn.) **Dysfunction in facilitation produced by prior classical conditioning in rats with lesions in midline cortex.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 385-391.—In Phase 1, 17 naive male Holtzman albino rats with lesions in anterior midline cortex and 18 operated controls ran in a runway either to a high sucrose reward, received goal-box placements to a high sucrose reward, or placements to a low sucrose reward. In Phase 2, all Ss ran to the low reward. Brain-damaged Ss previously run to high reward did not differ from comparable intact Ss. However, brain-damaged Ss placed to high rewards did not show subsequent normal facilitation of running speed but behaved in Phase 2 as if they had received low-reward placements in Phase 1. This effect was ascribed to lesion-induced dysfunction in the process by which classically conditioned emotional reward reactions energize instrumental performance, a dysfunction which is remedied by instrumental training.—*Journal abstract*.

5635. Hitt, John C., Hendricks, Shelton E., Ginsberg, Steven I., & Lewis, Joel H. (Texas Christian U.) **Disruption of male, but not female, sexual behavior in rats by medial forebrain bundle lesions.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 377-384.—In Exp. I and II with 31 and 26 sexually vigorous Sprague-Dawley male rats, bilateral electrolytic lesions in the paraformal medial forebrain bundle (MFB) virtually abolished mating. A postoperative anorexia was also observed, but smaller lesions curtailed mating without producing feeding deficits. In neither case was there evidence of gonodotrophic dysfunction. In Exp. III with 66 Sprague-Dawley spayed female rats, bilateral MFB lesions had no effect upon female sexual behavior (lordotic and soliciting behaviors) in Ss receiving weekly injections of estradiol benzoate (EB) and progesterone, but disrupted male sexual behavior (incomplete and complete copulatory patterns) in Ss receiving daily injections of testosterone propionate (TP). When hormone injection and testing procedures were reversed for these 2 groups, Ss initially tested for TP-induced male behavior showed normal female behavior, while lesioned Ss 1st tested for female behavior showed virtually no TP-induced male behavior. (15 ref.)—*Journal abstract*.

5636. Hothersall, David; Johnson, David A., & Collen, Arne. (Ohio State U., Lab. of Comparative & Physiological Psychology) **Fixed-ratio responding following septal lesions in the rat.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 470-476.—Assessed the effects of septal lesions upon the fixed-ratio behavior of 12 and 18 male Long-Evans rats.

In Exp. I it was found that, compared to a group of normal rats, Ss with septal lesions worked efficiently on much higher ratio requirements, and showed significantly higher response rates on all of the ratios employed. In Exp. II, the fixed-ratio behavior of groups of Ss tested as normals and then given either a septal lesion, a control operation, or a control rest period were compared. In Ss given septal lesions a clear facilitation of fixed-ratio responding was found, and this effect was not found in either of the 2 control groups.—*Journal abstract.*

5637. Kling, Arthur; Lancaster, Jane, & Benitone, Jerry. (U. Illinois, Coll. of Medicine, Chicago) **Amygdalectomy in the free-ranging vervet (*Cercopithecus Aethiops*).** *Journal of Psychiatric Research*, 1970(Feb), Vol. 7(3), 191-199.—Lesions of the amygdaloid nuclei in the free-ranging vervet, performed in a field experiment, resulted in an avoidance of social interactions, lack of positive affective responses to solicitous behavior and physical contact by group members, and a tendency to withdraw and hide from human Os. None of the operated Ss resocialized; by contrast, unoperated controls upon release from temporary captivity showed fear and aggressive responses followed by flight, but eventually returned to their own or another group. Some forms of postoperative behavior previously noted in laboratory studies or during caging were not observed in the field.—*R. V. Hamilton.*

5638. Lorens, Stanley A., Sorensen, John P., & Harvey, John A. (U. Iowa) **Lesions in the nuclei accumbens septi of the rat: Behavioral and neurochemical effects.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 284-290.—Lesions in the nuclei accumbens septi (NAS) of 20 male albino rats produced: (a) transient increases in food intake without affecting water consumption, (b) increased activity levels, (c) increased sensitivity to electric shock, (d) increased postshock running, (e) more rapid acquisition of a conditioned avoidance response, and (f) a reduction in the telencephalic concentration of serotonin. The effects of NAS destruction could not be attributed to incidental damage of septal nuclei. Common effects (c-f above) of lesions in the NAS and septal area might be due to interruption of projections to and from the medial forebrain bundle. It is suggested that the NAS plays a role that is different from the remainder of the striatum and that it is functionally related to the limbic system. (20 ref.)—*Journal abstract.*

5639. Means, Larry W., & Douglas, Robert J. (East Carolina U.) **Effects of hippocampal lesions on cue utilization in spatial discrimination in rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 254-260.—Tested 9 hippocampally damaged, 10 cortically ablated, and 9 normal Long-Evans rats for cue preference and utilization before acquisition, at criterion performance, and during extinction of a spatial discrimination task in a cross maze. Lesions did not alter preacquisition cue preferences and Ss in all 3 groups utilized response cues to perform the discrimination. The hippocampally damaged Ss demonstrated perseveration to response cues during extinction.—*Journal abstract.*

5640. Meshcheryakov, V. A. (Inst. of Experimental Medicine, Leningrad, USSR) **Regulyatsiya obshchego funktsional'nogo sostoyaniya golovnogo mozga pri povrezhdenii nespetsificheskikh struktur.** [Regulation of the general functional state of the brain in lesion of the nonspecific structures.] *Zhurnal Vysshei Nervnoi*

Deyatelnosti, 1969, Vol. 19(3), 534-536.—3 dogs with electrodes implanted into the mesencephalic reticular formation and the medial group of thalamic nuclei, were Ss in a study, utilizing classical salivary conditioning, of the influence of lesion of the nonspecific structures of the di- and mesencephalon on the regulatory mechanisms of the general functional state of the brain. The data suggest that the implantation of the electrodes into the nonspecific formations of the brain produces a primary lesion of the structures which play an important role in the maintenance of the level of cortical activity characteristic for the waking state. This promotes the emergence and maintenance of the neurotic states observed in the S.—*I. D. London.*

5641. Quay, W. B. (U. California, Berkeley) **Pre-circadian entrainment and associated characteristics of activity patterns following pinealectomy and reversal of photoperiod.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1281-1290.—Studied spontaneous running activity in individual female S₁ rats under controlled conditions. Matched siblings, 7 pinealectomized (p), 5 sham-operated (s), and 5 unoperated (u) at 22½-24½ wk. of age, were studied in their responses to 4 successive reversals ($\Delta\Phi=12$) of the environmental photoperiod when they were 27½-37½ wk. old. Initial mean shift in activity starting time following $\Delta\Phi$ was 6-7 hr. ahead in the p Ss as compared with the controls, and mean reentrainment time, according to activity starting time, was 3.03 + 1 days in the p Ss as compared to the controls. The post $\Delta\Phi$ activity of the p Ss also differed in showing a sharp differentiation of circadian (prelights-off) and photoperiod-dependent (postlights-off) segments of activity phase, and in having an unusually close temporal relation and suggested dependency to the white-lights-off Zeitgeber during the 1st days following $\Delta\Phi$. Possible contributions of age, experience, and central mechanisms underlying the pineal effects are discussed. (15 ref.)—*Journal abstract.*

5643. Slotnick, Burton M., & Brown, David L. (National Inst. of Mental Health, Lab. of Neurophysiology, Bethesda, Md.) **Fear conditioning and passive avoidance in mice with septal lesions.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1255-1259.—In a 2-compartment choice test, 21 adult male CF-1 mice bearing septal lesions showed a well-discriminated fear response following punishment in the preferred compartment, but showed less freezing behavior than did controls. In Exp. II, these same experimental Ss showed significant deficits in passive avoidance and fear conditioning in a task which required response inhibition. Results offer support for the hypothesis that deficits in passive avoidance and fear conditioning following lesions of the septal area derive from the loss of inhibitory influences normally provided by this forebrain area. 5644. Stovichek, G. V., Nikulin, V. M., & Zelenkov, R. I. (Medical Inst., Yaroslavl, USSR) **Nekotorye morfologicheskie kriterii afferentnoi spinnomozgovoi innervatsii vnutrennikh organov.** [Some morphological criteria of afferent cerebrospinal innervation of the internal organs.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 113-116.—Details the quantitative characteristics of the afferent connections with

the spinal cord of a number of organs. In the transverse slices of nerves of human and animal internal organs (heart, lungs, small intestine, liver, kidney), a number of conductors of large and medium caliber were encountered which, according to experimental and morphological data, were outgrowths of neurons from the vertebral ganglia. The number of viscerosensory fibers in the extraorganic nerves was not large. The degree of development of afferent connections with the spinal cord is different for the various organs. Following the indicated sequence, the heart has the most and the kidneys the least number of sensory conductors. Many internal organs possess local neuroreflex mechanisms and have no need for afferent spinal innervation for the implementation of specific functions.—*I. D. London.*

5645. Treichler, F. Robert & Dengerink, Harold A. (Kent State U.) **Visual and spatial probability learning by the rat: Selective decortication influences.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1229-1233.—Undertook the assessment of probability learning and reversal on spatial and visual tasks after anterior or posterior neocortical lesions. 60 male Holtzman albino rats were tested on a 70:30 probability gain in a double-bar apparatus using discrete trial correctional procedures. It is concluded that: (a) the spatial task yielded higher asymptotic choice of a more frequently reinforced alternative than the visual task, (b) anterior and posterior lesions showed no differential effects, (c) acquisition on the spatial task was slightly more rapid for normal than for operated Ss, (d) visual reversal was extremely difficult under the present conditions, and (e) trial-by-trial analyses showed little differentiation among the treatment conditions.—*Journal abstract.*

5646. Wolf, George; Dicara, Leo V., & Braun, J. Jay. (Rockefeller U.) **Sodium appetite in rats after neocortical ablation.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1265-1269.—Experimentally naive adult Sprague-Dawley rats with ablations of either the entire neocortex (N = 16) or just the sensory cortex (N = 7) including the taste projection area responded to sodium depletion or mineralocorticoid treatment by increasing their intake of sodium chloride solution. The natrorectic response of the decorticate Ss to sodium depletion was somewhat attenuated or delayed in comparison to 14 intact controls but their response to mineralocorticoid treatment was normal.—*Journal abstract.*

Brain Hypothalamic & Hippocampal Lesions

5647. Grossman, Sebastian P. & Grossman, Lore. (U. Chicago) **Surgical interruption of the anterior or posterior connections of the hypothalamus: Effects on aggressive and avoidance behavior.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1313-1317.—Transverse surgical cuts through the anterior hypothalamus, just anterior to the level of the ventromedial nuclei, which interrupted most, if not all of the anterior projections to and from the hypothalamus, inhibited intraspecies aggressive behavior in 48 albino Sprague-Dawley female rats but produced little or no change in shuttle box avoidance behavior. Transverse surgical cuts through the posterior hypothalamus, just posterior to the level of the ventromedial nuclei, which interrupted all posterior connections of the hypothalamus except those coursing through the fornix or the ventrolateral hypothalamus, markedly depressed shuttle box avoidance behavior but affected aggressive reactions little or not at all. Both

types of cuts produced hyperphagia and hyperdipsia but these effects had subsided in most Ss before the tests of avoidance and aggressive behavior were begun. Tests of motor coordination and catatonia indicate that the observed behavioral deficits could not be due to a general motor impairment. Implications of these results are discussed with reference to previously reported effects of parasagittal cuts which transect the lateral connections of the hypothalamus. (19 ref.)—*Journal abstract.*

5648. Hirsh, Richard. (California Inst. of Technology, Pasadena) **Lack of variability or perseveration: Describing the effect of hippocampal ablation.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1249-1254.—Once established, the behavior of hippocampally ablated animals is extremely resistant to modification. This may be described as perseveration, a tendency to repeat what has just been done, or as a lack of variability, a tendency to do just 1 thing. 5 intact, 8 neocortically ablated, and 11 hippocampally ablated Sprague-Dawley rats were run in a 4-choice situation. Hippocampal ablates show distributions of choices that depart more from 1 in which all 4 choices are equiprobable than do those of controls. Thus they may be described as lacking in variability. The probabilities of occurrence for each of the choices are used to predict sequential aspects of the behavior under an assumption of trial to trial independence, random combination. Perseveration and alternation are defined in terms of the direction of the deviation of the observed behavior from this prediction. For most hippocampally ablated Ss the predictions are accurate. A few may perseverate and a few may alternate. Control animals alternate. Hippocampally ablates may be described as failing to alternate. An explanation in terms of memory processes is advanced. (21 ref.)—*Journal abstract.*

5649. Kirakosyan, E. V. (Medical Inst., Erevan, USSR) **Ob uchastii mamillyarnykh yader gipotalamusa v regulyatsii eritropoëza.** [On the participation of the hypothalamic mamillary nuclei in the regulation of erythropoiesis.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 22-23.—Employed 25 rabbits, with bilateral electrolytic coagulation of the posterior hypothalamus in the region of the mamillary nuclei, in a study of the resultant changes in the system of humoral regulators of erythropoiesis-erythropoietins and several indices of peripheral blood and bone marrow. Such lesions caused a prolonged wave-like anemia which was most marked in the 3rd and 16th postoperative wk. The 1st wave on anemia was accompanied by a rise of erythropoietic activity of the blood, reticulocytosis, leucocytosis, etc. At the peak of the 2nd wave of anemia, a reduction occurred in the quantity of erythroblastic elements in the bone marrow without changes in the level of reticulocytes, leucocytes, and erythropoietins in the blood.—*I. D. London.*

5650. Meyer, Cornelius C. & Salzen, Eric A. (Quinnipiac Coll.) **Hypothalamic lesions and sexual behavior in the domestic chick.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 365-376.—Induced 110 Rhode Island Red × White Rock chicks primed with androgen to show copulatory behavior to a prone hand. Ss which showed strong copulatory patterns were then given bilateral electrolytic lesions in either the hypothalamus or preoptic area. Ss which had bilateral symmetrical lesions in the dorsal anterior hypothalamus showed a loss of copulatory

behavior which did not recover over postoperative tests. Symmetrical lesions in the lateral preoptic area, paleostriatum, or ventral anterior hypothalamus, as well as asymmetrical lesions in any region, impaired copulatory responses but they had recovered by the end of the postoperative test period. Sham lesions gave no disruption of copulatory responding. None of the lesions impaired aggressive behavior. Ss with deficits in copulatory behavior gained weight during the postoperative period and were able to discriminate and react emotionally both before and after surgery.—*Journal abstract.*

5651. Papsdorf, James D. & Woodruff, Michael. (U. Michigan) Effects of bilateral hippocampectomy on the rabbit's acquisition of shuttle-box and passive-avoidance responses. *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 486-489.—Determined the acquisition rates of 2-way active-avoidance and passive-avoidance responses for hippocampectomized, cortical control, and normal New Zealand rabbits. In agreement with investigations employing the rat, hippocampectomized Ss acquired the 2-way active-avoidance response more rapidly than controls, while demonstrating extremely poor passive-avoidance behavior.—*Journal abstract.*

5652. Udalova, G. P. (Leningrad State U., USSR) Vliyaniye razrusheniya nekotorykh yader gipotalamusa na vlstserokhimicheskie uslovnye refleksy. [Influence of extirpation of certain hypothalamic nuclei on viscerosensory conditioned reflexes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 360-362.—Used 2 dogs to study the degree of participation of the hypothalamus in the "structure of the internal chemical analyzer." For study of the role of the hypothalamus in the analysis and synthesis of viscerosensory signals, the method of salivary CRs was utilized in combination with the complete and partial extirpation of certain hypothalamic nuclei. CRs were elaborated to irrigation of an isolated intestinal loop with a .25% solution of HCl, with water as the differentiator. A CR was also elaborated to a 440-cps tone, with a 600-cps tone as differentiator. In the latter CR, irrigation of the oral cavity with 10 ml. of a .4% solution of HCl served as unconditioned reinforcement. The essential role of the hypothalamus is shown in the activity of the viscerosensory analyzer. Extirpation in the region of the medial hypothalamus led to (a) a sharp decrease in the magnitude of the CR to irrigation of the intestinal loop with acid, (b) disinhibition of interoceptive differentiation, and (c) the absence of adequate reactions to changes in the acid base balance in the organism. Lesion of the preoptic region results only in a worsening of the differentiation of viscerosensory signals. Data suggest that the participation of different parts of the hypothalamus in the analysis of chemical signals from the small intestine and from changes in the internal environment of the organism is of uneven degree.—*I. D. London.*

BRAIN STIMULATION

5653. Deryabin, L. N. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) O stereotaksicheskoi orientatsii golovy krolika porody shinshilla v razlichnye periody postnatal'nogo ontogeneza. [On stereotaxic orientation of the head of chinchilla rabbits at different periods of postnatal ontogenesis.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 723-729.—Presents data on the incorrect

position of the zero horizontal plane in stereotaxic orientation of the head of nonstandard Russian chinchilla rabbits of all ages, when Sawyer, Everett, and Green's method is used. A new way of orienting the head of nonstandard rabbits is suggested.—*I. D. London.*

Chemical Stimulation

5654. Alekseeva, I. A. (Inst. of the Brain, Moscow, USSR) Izmenenie slozhnykh form uslovykh refleksov pod vliyaniem aplikatsii diétilamida lizerginovoï kisloty (DLK) i mescalina na korkovye kontsy slukhovogo i zgriel'nogo analizatora. [Change in complex forms of conditioned reflexes under the influence of the application of lysergic acid diethylamide (LSD) and mescaline onto the cortical termini of the auditory and visual analyzers.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 279-285.—Used 2 dogs and 4 cats to determine the features typifying the nervous processes in the visual and auditory analyzers when LSD (100 microgm.) and mescaline (2-4 mg.) are directly applied onto their cortical termini following the formation of complex forms of alimentary CR activity. CRs were elaborated to complex stimuli, components of which were directed to both the auditory and visual analyzers. Serving as conditioned signals were a simultaneous complex and 2 component chain stimuli. The direct application of LSD and mescaline onto the cortical termini of the auditory and visual analyzers changed the functional state of the CRs to stimuli, directed to these analyzers. Depending on the pattern of the complex stimuli (delayed, chain, simultaneous) and on the place of application, LSD and mescaline promoted the propagation of both excitatory and inhibitory processes, strengthening that process which is dominant in a given integrative activity. Data suggest that LSD exerts primary influence on nervous processes, directed to the visual analyzer; mescaline on those directed to the auditory analyzer.—*I. D. London.*

5655. Butuzov, V. G. (Inst. of Pharmacology & Chemotherapy, Moscow, USSR) O roli nishkodyashchego tormozheniya v osushchestvlenii deprirovushchego vliyaniya katekholaminov na simpaticheskii tonus i sosudodvigatel'nye refleksy. [On the role of descending inhibition in effecting the depressing influence of catecholamines on sympathetic tonus and vasomotor reflexes.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 65-69.—Injected immobilized narcotized vagotomized cats with (a) noradrenaline and adrenaline in doses of 200-300 microgm. into the lateral and 4th ventricles and the spinal epidural space; and (b) dopa (40 mg/kg injected iv) on tonic activity, reflex responses in sympathetic nerves, and vasomotor reflexes. Electroneurographic recordings were made of the tonic activity and reflexly evoked discharges in the cardiac and renal sympathetic nerves on stimulation of the afferent A and C fibers of the tibial and splanchnic nerves. The inhibiting effect of catecholamines and dopa increased considerably after decerebration and did not manifest itself in spinal Ss, whereas microinjections of noradrenaline (.1-5 microgm.) in the region of nucleus gigantocellularis and the inferior olivary complex sharply increased the inhibitory influence of these structures on tonic activity and reflex discharges in the sympathetic nerves. It is suggested that the catecholamines can activate the processes of reticulospinal inhibition, which influence the descending control of sympathetic and vasomotor tonus.—*I. D. London.*

5656. Castellucci, Vincent F. & Goldring, Sidney. (New York U., Medical School) **Contribution to steady potential shifts of slow depolarization in cells presumed to be glia.** *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 109-118.—Analyzed the relationship between cortical steady potential (SP) shifts and slow depolarization (SD) in presumed glial cells in 129 adult cats during direct cortical and thalamic stimulation. Results show that: (a) during direct cortical stimulation, SP shift and SD amplitudes diminish gradually from the surface downward, and a polarity reversal of SP shift is not seen even though the primary potentials that follow each stimulus do reverse; (b) with low frequency thalamic stimulation, SP shift and SD have similar distribution with both evident throughout the cortical thickness; (c) with high frequency stimulation, presumed glial cells continue to show SD in the cortical depth, but SP shifts can be bigger, smaller, or can reverse in polarity at lower levels; and (d) the effect of sodium pentobarbital on SP shift and SD is the same. Results indicate that presumed glial cells and neurons account for stimulus-bound, cortical SP shifts. It is suggested that with low frequency stimulation of cortex or thalamus, the SP shift reflects predominantly glial SD; at high frequency, SP shifts are a blend of glial and neuronal depolarization. 5658. Friedman, Mathew J. & Wikler, Abraham. (U. Kentucky, Medical Center) **The effect of introhypothalamic microinjection of hemicholinium (HC-3) on the hippocampal theta rhythm of cats.** *Psychopharmacologia*, 1970, Vol. 17(4), 345-353.—Acute (N = 3) and chronic (N = 3) intact adult cat preparations were made with recording electrodes in the dorsal hippocampus and cerebral cortex, stimulating electrodes in the mesencephalic reticular formation, and an injectrode (an injection cannula-electrode assembly) in the posterior hypothalamus through which both electrical and pharmacological stimulation could be applied. 12-200 mg. hemicholinium suppressed the hippocampal theta rhythm of the reticular formation or the posterior hypothalamus. The latency for this effect was from 90 min.-3 hr. Reticular-induced desynchronization of the cortical EEG disappeared 2-5 hr. after drug administration. Reversal of the drug effect on the hippocampal theta rhythm occurred shortly after administration of carbachol, bethanechol, and pilocarpine. No consistent behavioral effects accompanied these changes in EEG. (15 ref.)—*Journal abstract*.

5659. Gumnit, Robert J., Matsumoto, Hideo, & Vasconetto, Costante. (St. Paul-Ramsey Hosp., Minn.) **DC activity in the depth of an experimental epileptic focus.** *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 333-339.—Created experimental seizure foci in the cortex of 45 cats by the topical application of penicillin. Glass micropipettes were used to record the DC field in the depth of the cortex underneath the focus. Vertically oriented dipoles of differing structure were found. In the area of intense surface negative ictal shifts, the maximum negativity was found in Layer V of the cortex. No reversal of sign was

found within the depths of the cortex, indicating that nearly the entire neuron was depolarized with the source of current flow located in the axons and/or the finest arborizations of the dendrites. In the periphery of the focus, where positive shifts can be recorded from the surface, the shifts reverse sign in the upper 300-500 μ of the cortex, and the maximum negativity also was located in Layer V. (French summary) (17 ref.)—*Journal summary*.

5660. Herz, A., Zieglängsberger, W., & von Freytag-Loringhoven, H. (Max-Planck Inst. für Psychiatrie, Munich, W. Germany) **Development of fields of local potentials in the caudate nucleus following microelectrophoretic application of glutamic acid and GABA.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 247-258.—35 nonanesthetized rabbits, the extent of the induced potential field was determined by means of double multibarrelled electrodes with intertip distances of 75-240 μ . The typical response evoked by single stimuli to midline structures of the thalamus showed 3 parts. These were well pronounced only after increase of neuronal excitability following microelectrophoretic application of glutamic acid: (a) a positive-negative wave accompanied by neurone discharges, (b) a flatter negative-positive wave without discharge activity, and (c) rhythmic after-discharges (spindles) consisting of arcade-shaped (16 cps) waves. The effect of glutamate was most pronounced in low spontaneous activity. Gamma aminobutyric acid (GABA) was particularly effective in inhibiting the glutamate-induced potentials. Relative independence of the various parts of the evoked response could be demonstrated when the intensity of thalamic stimulation and dosage of glutamate were varied. Local application of glutamate induced focal potentials of more than 1-mV amplitude, generated in an area having a radius of 100-150 μ . The area of these fields corresponded closely with the spread of glutamate. On the basis of histological studies, the maximal number of neurones contributing to these focal potentials was determined. (German summary) (38 ref.)

5661. Jaffard, Robert & Cardo, Bernard. (Lab. de Psychophysiologie, Faculté des Sciences, Talence, France) **Influence of intracortical injections of ribonuclease on the acquisition and retention of operant behavior and visual discrimination.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1303-1308.—In Exp. I the bilateral intracortical injection of 100 μ g. of ribonuclease in 14 male Sprague-Dawley rats considerably disturbed acquisition in the Skinner box. A correct acquisition was not obtained until 180 hr. after the injection. The Ss' level of activity was not modified; their food consumption diminished slightly. The same injection performed on 7 rats having already acquired this behavior pattern had practically no effect. In Exp. II, the bilateral intracortical injection of 100 μ g. of ribonuclease in 12 Ss disturbed the acquisition of visual discrimination. The injection had a far greater effect when the trials were spaced than when they were grouped. The meaning of these results is discussed. (18 ref.)—*Journal abstract*.

5662. Krylov, O. A., Kalyuzhnaya, R. L., & Tongur, V. S. (Inst. of the Brain, Moscow, USSR) **Vozmozhnost' peredachi uslovnoi svyazi posredstvom biokhimicheskogo substrata.** [The possibility of transmission of a conditioned connection by means of a biochemical substratum.] *Zhurnal Vyshei Nervnoi Deyatel'nosti*, 1969,

Vol. 19(2), 286-292.—Used white mice, in which electro-defensive or alimentary CRs had been elaborated to place in a T maze, to test the assumption that transfer of learning (CRs) from 1 animal to another is possible through utilization of a cerebro-biochemical substratum enriched with RNA. Ss were decapitated after training in the CR, with subsequent preparation of a brain extract. This extract (.02 ml.) was administered subdurally in symmetrical regions of the brain (Brodman's Field 4) of untrained Ss. Data indicate a tendency toward transmission of "acquired experience" by means of a cerebro-biochemical substratum. This tendency persisted in most cases for 2-3 days after administration of the brain extract from trained donors. Opposite actions of concentrated and diluted extracts of the brain are noted with respect to choice of the T arms by recipient Ss.—*J. D. London.*

5663. Warburton, David M. & Russell, Roger W. (U. California, Irvine) **Some behavioral effects of cholinergic stimulation in the hippocampus.** *Life Sciences*, 1969(Jun), Vol. 8(12, Pt. 2), 617-627.—The hippocampus has been implicated in the hypothesis of central neurochemical processes mediating behavioral inhibition which are cholinergic. Male Sprague-Dawley 90-120 day old rats were implanted with hippocampal cannulae and tested on a stable go-no go single alternation in Skinner boxes using a panel light for trial onset and liquid reward. Single alternation training was begun and the treatments consisted of administration of atropine sulfate, carbamylcholine chloride, physostigmine sulfate, and a saline control. After injection Ss were placed in the Skinner boxes and responses recorded for 1 hr. Atropine sulfate increased alternation errors but had little effect on ITI responses. Carbamylcholine chloride had the opposite effects with the magnitude of change greater for ITI responding than for alternation errors. Physostigmine sulfate produced a small increase in ITI responding and alternation errors. The minimum effective behavioral dose of atropine sulfate was also determined. These results demonstrate the behavioral sensitivity of the ventral hippocampus to both carbamylcholine chloride and atropine sulfate. The hippocampus is discussed as part of a pathway possibly mediating nonreinforcement effects. (23 ref.)—*W. E. Wood.*

5664. Winson, Jonathan & Miller, Neal E. (Rockefeller U.) **Comparison of drinking elicited by eserine or DFP injected into preoptic area of rat brain.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 233-237.—Injection of eserine into the preoptic area of the rat brain will cause water-satiated Ss to drink when water is made available 60 min. after injection but not beyond that time, whereas injection of diisopropyl fluorophosphate (DFP) will cause drinking up to 210 min. after injection. Ss were Sprague-Dawley rats. The drinking is presumably caused by inhibition of cholinesterase at cholinergic synapses. The cessation of drinking in the case of eserine, a reversible inhibitor, probably results from a drop in concentration at the site with time; in the case of DFP, a reportedly irreversible inhibitor, the cessation may be due to the resynthesis of a known isozyme of cholinesterase with a $\frac{1}{2}$ -life of 3 hr. or to spontaneous reactivation of the enzyme.—*Journal abstract.*

Electrical Stimulation

5665. Aquino-Cías, J., et al. (Academy of Sciences,

Inst. of Neurophysiology & Psychology, Havana, Cuba) **Epilepsia y cardiótonicos.** [Epilepsy and cardiotonics.] *Revista Cubana de Medicina*, 1968(Apr), Vol. 7(2), 171-181.—Investigated the effect of iv and topical corticosteroids on the duration of after-discharges on stimulation of the frontal cortex. 24 curarized and vagetomized cats and 10 cats which were curarized only served as Ss. Results show that ouabain and strophanthin prolong the duration of seizures induced by electrical stimulation. Topical application of these drugs elicited spikes at the application site which spread to neighboring cortical and subcortical structures, which resulted in a generalized seizure. Results are discussed in terms of ionic changes affecting both intra- and extracellular space which were caused by the cardiotonics. The effects of irritation on the aortic, carotid, and vagus zones and the direct action on the cell membrane of the neuron are discussed. (19 ref.)—*English summary.*

5666. Bloch, Vincent; Deweer, Bernard, & Hennevin, Elisabeth. (Lab. de Psychophysiologie, Faculté des Sciences, Lille, France) **Suppression de l'amnésie rétrograde et consolidation d'un apprentissage à essai unique par stimulation réticulaire.** [Suppression of retrograde amnesia and consideration of an experiment by a unique attempt at reticular stimulation.] *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1235-1241.—In order to avoid possible cumulative effects of repeated treatments, a 1-trial learning task based on a discrimination reversal technique with water as reinforcement was used. 4 groups of Wistar rats with chronically implanted intracranial and cortical electrodes were studied in a 1-trial discriminative learning based on water reinforcement. Group I, 90 sec. after the trial, received fluothane anesthesia in order to interrupt the consolidation period. Group II received very low intensity stimulation of the mesencephalic reticular formation during the 90-sec. interval between the end of the trial and anesthesia. Group III received reticular stimulation not followed by anesthesia. Group IV had a pseudotreatment (control). All groups were tested for retention of learning. Results show no retention for Group I; normal retention for II, with a performance identical with that of control group; III shows better retention than control group. Results indicate that a mild reticular stimulation during consolidation period even when delivered once, enhances memory storage. Results are discussed in relation to theory of consolidation and mechanisms of arousal. (18 ref.)—*Journal abstract.*

5667. Bogoslovskii, M. M. (Inst. of Experimental Medicine, Leningrad, USSR) **Elektricheskie otvety izollirovannoi kory v khronicheskom eksperimente.** [Electrical responses of isolated cortex in chronic experiment.] *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 337-342.—Used 8 adult cats to study the electrical responses of the left hemispheric neocortex, surgically isolated from subcortical influences, when direct electrical stimulation was applied over a period of 6 postoperative mo. Electrodes were implanted in the supra- and ectosylvian gyri of both the isolated and intact hemisphere. The thresholds for the emergence of direct cortical responses in the isolated cortex, attained in the 2-3 wk. after the operation (.5-5 V.) declined afterwards to .1-.2 V. Both in the early and later periods after cortical isolation, the direct cortical responses of the middle suprasylvian gyrus of the isolated cortex were distinguished by their lower thresholds as compared with

other parts of the same gyrus and with other gyri. Direct cortical responses were easily propagated over the supra- and ectosylvian gyri of the isolated cortex to a considerable distance from the stimulation point.—*I. D. London.*

5668. Ciofalo, V. B. & Malick, J. B. (Schering Corp., Bloomfield, N.J.) **Evoked aggressive behavior in *Cebus apella*: A new world primate.** *Life Sciences*, 1969(Oct), Vol. 8(19, Pt. 1), 1117-1122.—Describes a successful attempt to evoke aggressive behavior in 5 *Cebus apella* monkeys utilizing brain stimulation under different environmental conditions. Direct leads between the brain and stimulator were used successfully in a free social environment.—*Journal summary.*

5669. Danilova, L. K. (Pavlov Inst. of Physiology, Leningrad, USSR) **Образование и структура пishchevykh uslovnykh reflektsov na fone stimulyatsii mindalevidnogo kompleksa.** [Formation and structure of alimentary conditioned reflexes against a background of stimulation of the amygdaloid complex.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 419-426.—Dogs, with electrodes chronically implanted into the amygdala, hippocampus, and several zones of the cerebral cortex, were used to study the influence of amygdaloid stimulation by current (0.5 V.) of various frequencies (1, 40, 100 impulses/sec) on the speed and dynamics of formation of positive alimentary CRs. It was established that speed of formation of alimentary CRs against a background of amygdaloid stimulation is not different from that of its formation under normal conditions and does not depend on either the frequency of the stimulating current or the degree of inhibition of secretion. The magnitude of CRs, elaborated with simultaneous stimulation of the amygdala, is considerably lower than the normal magnitude and is a function of the parameters of the stimulating current. Stimulation of the amygdala, especially high-frequency stimulation, brings about an impairment of the structure of the CR.—*I. D. London.*

5670. Davydova, E. K. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Izmenenie poroga dvigatel'noi reaktzii na pryamoie élektricheskoe razdrashenie kory v protsesse ugasheniya i vosstanovleniya pishchego uslovnogo reflektsoa.** [Change in the threshold of motor reaction to direct electrical stimulation of the cortex in the process of extinction and restoration of an alimentary conditioned reflex.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 531-533.—Dogs, in which alimentary CRs had been elaborated to direct electrical stimulation of the motor cortex, were used to study the change in excitability of the "cortical structure of the signal stimulus" in the process of extinction of the CR. The elaboration of the CR heightened the threshold of the motor reaction; extinction of the CR lowered it; restoration of the CR again heightened it. During stabilization of the CR, the threshold of motor reaction was heightened in comparison with the beginning period of its elaboration. Conversely, in the process of extinction, the threshold of motor reaction was lowered when the CR no longer appeared. The fact that, in the beginning period of extinction of the CR, the threshold of motor reaction was not changed, while in deep extinction it was lowered, is taken as evidence that, in the beginning, extinctive inhibition does not spread to the structural elements of the reflex "proper."—*I. D. London.*

5671. Devor, Marshall G., Wise, Roy A., Milgram, Norton W., & Hoebel, Bartley G. (Massachusetts Inst. of Technology) **Physiological control of hypothalamically elicited feeding and drinking.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 226-232.—Feeding and drinking elicited by electrical stimulation of the hypothalamus are under the control of factors which modulate normal hunger and thirst. In 7 adult male Wistar rats, and 6 Sherman albino female and 4 Long-Evans hooded female rats that both ate and drank in response to stimulation, food intake inhibited elicited eating but not drinking, whereas water inhibited elicited drinking but not eating. Deprivation had opposite effects. Thus, hypothalamically elicited behaviors are neither rigid nor undirected results of stimulation; food and water intake exert specific and homeostatically appropriate control over the neural systems involved in elicited feeding and drinking.—*Journal abstract.*

5672. Hurwitz, Harry M. & James, Robert E. (U. Tennessee) **Deferment of intracranial reinforcement: Incentive power of ICS.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1309-1312.—Tested 5 chronically implanted male hooded Long Evans rats with electrodes in the medial forebrain bundle for rates of self-stimulation under deferment of reinforcement and fixed interval procedures. Deferments between the lever press and the reinforcement of 0-15 sec. were investigated. Results demonstrate an extremely steep deferment gradient and a marked response rate differential between the fixed interval and deferment procedures. Results are interpreted in an incentive framework. (17 ref.)—*Journal abstract.*

5674. McKenzie, J. S. & Smith, Margaret H. (U. Melbourne, Victoria, Australia) **Hippocampal responses to neocortical stimulation in the chloralose-anesthetized cat.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 273-280.—In 44 male and female cats under chloralose or chloralose-urethane anesthesia, evoked field responses to single shock stimulation of the dorsolateral neocortex were recorded in the dorsal and posterior hippocampus with the use of tungsten microelectrodes. Large evoked potentials were observed in the adjacent white matter above the lateral ventricle, but responses located in the hippocampus were distinguished by laminar recording through the formation. Responses were of short initial latency, with negative-positive configuration at superficial levels. No responses were observed in the anteroventral hippocampus, but responses were present in the subjacent entorhinal area. Unitary responses were evoked regularly by septal or entorhinal stimulation but rarely by neocortical stimulation, during which they were positive-going, of low amplitude, and unstable. Cortically evoked unit discharges were located in alveus, stratum oriens and, in 1 instance, in stratum radiatum; they appeared to arise not from pyramidal cells, but from axons or small neurons. Results suggest a cortical projection to hippocampal interneurons, the significance of which requires investigation in unanesthetized animals. (French summary) (21 ref.)—*Journal summary.*

5675. Mendelson, Joseph. (Rutgers State U., Brain Research Lab.) **Food deprivation facilitates hypothalamic drinking.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1225-1227.—Implanted naive male hooded rats with chronic electrodes in the lateral hypothalamic drinking area and maintained them on ad lib water. 1-3 days of food deprivation slightly decreased the minimum amount of current necessary to induce the water-satiated Ss to drink. It is proposed that food deprivation exerts a facilitatory effect on the neural substrate governing water intake, but that this effect is usually obscured by the fact that food-deprived animals need less water to maintain their normal body-fluid balance.—*Journal abstract*.

5676. Mendelson, Joseph. (Rutgers State U., Brain Research Lab.) **Palatability, satiation and thresholds for stimulus-bound drinking.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1295-1297.—Implanted 5 Long-Evans hooded rats with chronic electrodes in the drinking area of the lateral hypothalamus. Their drinking thresholds for tap water and moderately strong saccharine and quinine solutions were measured. Ss were always satiated on the solution under test. Compared to water, their mean ad lib intake of the saccharine solution increased by 149% and that of quinine decreased by 52%. Their saccharine thresholds were lower than their water thresholds, and for 3 of the 4 Ss quinine thresholds were higher than those for water. Results are interpreted in terms of taste-dependent intensities of input to reward circuits in the lateral hypothalamus generated by feedback from drinking. It is tentatively concluded that for any given solution, the greater its palatability the less the level of satiation attained on it.—*Journal abstract*.

5677. Merrill, H. Kent & Anderson, D. Chris. (Veterans Administration Hosp., Psychology Research Lab., Phoenix, Ariz.) **Attenuation of a passive-avoidance response via reinforcing intracranial stimulation in rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 274-277.—Trained 24 naive male Long-Evans rats to press a lever for hypothalamic ICS and tested on a passive-avoidance task. $\frac{1}{2}$ of the Ss were exposed to traumatizing inescapable footshock (preshock) prior to passive-avoidance testing and $\frac{1}{2}$ received no preshock. $\frac{1}{2}$ of the Ss received a 3-ma and $\frac{1}{2}$ a 1.5-ma punishing shock during passive-avoidance testing. Analysis of variance and a Newman-Keuls test show that passive avoidance developed only in Ss exposed to preshock and the 3-ma test shock.—*Journal abstract*.

5678. Posluns, Donald & Vanderwolf, C. H. (U. Western Ontario, London, Canada) **Amnesic and disinhibitory effects of electroconvulsive shock in the rat.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 291-306.—Ss were 878 naive male hooded rats. The ECS 1 sec. after learning in a 1-trial escape task, or 30 sec. after active-avoidance acquisition, induced no retention deficits. 1 ECS had no anterograde effect upon escape but facilitated avoidance acquisition 24 hr. later. The ECS 30 sec. after passive-avoidance training in a situation similar to the escape task produced retention deficits and, in 2 other passive-avoidance tasks, ECS produced temporally graded retention deficits (up to 10 and 60 sec., respectively). 5 ECSs before training increased retention deficits produced by 1 posttraining ECS in a passive-avoidance task but not in the escape task. Perhaps ECS concomitantly

induces a slight memory impairment and a slight impairment of movement inhibition, and these effects combine synergistically to produce retention deficits in passive-avoidance tasks. (40 ref.)—*Journal abstract*.

5679. Sakhiulina, G. T. & Serdyuchenko, V. M. (Inst. of Higher Nervous Activity & Neuropsychology, Moscow, USSR) **Elektrofiziologicheskoe vyrazhenie uslovnnykh refleksov zapazdyvaniya, obrazovannykh na preryvisto-otstavlennoe razdrasheniye spetsificheskogo yadra talamusa u koshek.** [Electrophysiological manifestation of retarded, conditioned reflexes formed in response to intermittent-delayed stimulation of the specific thalamic nucleus in cats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 528-530.—For 5 Ss, stimulus duration was 1 sec.; followed by a 4-sec interval, a 1-sec stimulus, etc., followed by alimentary reinforcement. The data indicate that, however deep the inhibition of the retardation characteristic for the 1st segment of the multiple series of stimulation, it was not accompanied by any late components whatsoever of growth potential. The phases, marking the gradual transition from inhibition to excitation, were characterized electrophysiologically by late negative components, developing with various latent periods. The longest latent period for the appearance of the late negative wave corresponded to a predominance of the inhibitory process; with the predominance of excitation, its latent period shortened progressively.—*I. D. London*.

5680. Schuckman, H., Kluger, A., & Frumkes, T. E. (Queens Coll., City U. New York) **Stimulus generalization within the geniculo-striate system of the monkey.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 494-500.—Trained 4 monkeys to press a lever in response to electrical ICS. 1 monkey trained to stimulation of the lateral geniculate body (LGB) failed to show any stimulus generalization (SG) when either the contralateral LGB or the striate cortex was stimulated. Similarly, no SG was seen in another S when LGB stimulation followed training to stimulation of the striate cortex. The SG was observed when stimulation of the striate cortex followed reinforced stimulation of other regions of the striate cortex. Results indicate that the consequences of electrical stimulation are not equivalent at all levels of the geniculo-striate system. (17 ref.)—*Journal abstract*.

5681. Segal, B. M., Nerobkova, L. N., & Rybalkina, S. V. (Research Inst. of Psychiatry, Moscow, USSR) **"Vlechenie" k alkogolyu pri stimulyatsii yader gipotalamusa u kryss.** ["Urge" for alcohol in stimulation of the hypothalamic nuclei in rats.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 688-691.—22 rats, with electrodes implanted in the ventromedial, lateral, and dorsomedial nuclei of the hypothalamus, were used to study the influence on alcoholic consumption of negative and positive emotional reactions, arising on stimulation of the "system of punishment" and the "system of encouragement." The need for alcohol in rats was dependent on the functional state of the hypothalamic "system of punishment." Enhancement of the activity of this system through its electrostimulation, which was accompanied by an avoidance reaction, brought about increased alcoholic consumption under free-choice conditions. Stimulation of the "system of encouragement" and its autostimulation suppressed the alcoholic drive. These data help illu-

minate the pathophysiological mechanisms of several forms of the alcoholic drive.—*I. D. London.*

5682. Serdyuchenko, V. M. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Izmeneniya v kartine potentsialov narastaniya pri peredelke sovpadayushchikh uslovykh reflektov v sledovye.* [Changes in the picture of growth potentials in transformation of coincident conditioned reflexes into trace conditioned reflexes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 357-359.—Used 5 adult cats to study the character of the "additional negative waves" which occur immediately after the growth potentials (augmenting responses) during the transformation of extant food procuring CRs into trace CRs. Ss were 1st taught to procure meat from a food trough with that forepaw with an electrode implanted in the cortical motor representative. A "coincident CR" (reinforcement at the 2nd sec. of the CS) was elaborated, with the CS provided by 3 sec. of rhythmic electrical stimulation of the thalamic nucleus, ventralis lateralis nerve. Transformation of the coincident CR into a trace CR was managed by postponing alimentary reinforcement to 3 and 5 sec. after cessation of the action of the conditioned signal. Negative waves of short latency, characteristic of coincident CRs, were not detected in the trace CRs; instead, those of long latency (60-80 msec.) were evident. These "additional negative waves" with long latent periods were recorded locally. The existence of a local and stable manifestation of such waves, immediately following the basic component of the growth potentials in trace CRs, indicates that the "additional negative waves" with long latent periods correspond to a process of active inhibition.—*I. D. London.*

5683. Shaber, Gary S., Brent, Robert L., & Rumsey, James A. (Thomas Jefferson U., Stein Research Center) *Conditioned suppression taste thresholds in the rat.* *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 193-201.—Determined the absolute taste-threshold values for saccharin, quinine hydrochloride, hydrochloric acid, and sodium chloride in 32 male adult Wistar rats, 8 Ss for each taste material, using a conditioned suppression behavioral protocol. Lateral hypothalamic stimulation was used as the reinforcement. The reinforcement (ICS) was not a discernible taste substance and, therefore, there was no interference with the measurement of absolute taste threshold. The taste thresholds were readily obtained within 3-4 wk. following surgical implantation of the hypothalamic electrodes and 2-3 wk. after the beginning of training. After training, a threshold value for each taste material was readily obtained during a 20-min experimental trial. (17 ref.)—*Journal abstract.*

5684. Steiner, Solomon S., Beer, Bernard, & Shaffer, Michael M. (Schering Corp., Bloomfield, N.J.) *Escape from self-produced rates of brain stimulation.* *Science*, 1969(Jan), Vol. 163(3862), 90-91.—Allowed 5 male albino rats to self-stimulate while their responses were recorded. Subsequently, prerecorded patterns of their brain stimulation were played back to them. All Ss learned to escape brain stimulation delivered in exactly the same manner as they had previously elected to receive it.—*Journal abstract.*

5685. Vardaris, Richard M. & Gehres, Larry D. (Kent State U.) *Brain seizure patterns and ESB-induced amnesia for passive avoidance.* *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1271-1275.—Produced retrograde amnesia in 32 male albino Holtzman rats receiving electrical stimulation of posterior cortex immediately

following footshock in a 1-trial passive avoidance situation. No retrograde amnesia was observed when the cortical stimulus was delayed 1 hr. 4 Ss having anomalous avoidance scores also produced abnormal brain seizure records in response to brain stimulation. It is concluded that brain seizure pattern is related to retention of the passive avoidance tendency.—*Journal abstract.*

5686. Vorob'eva, T. M. (Research Inst. of Neurology & Psychiatry, Kharkov, USSR) *O roli vzaimootnosheni nekotorykh elementov limbiko-retikulyarnogo kompleksa v reaktsii samorazdrasheniya.* [On the role of the interrelation between some elements of the limbicorecticular complex in the autostimulatory reaction.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 680-687.—G. Olds and P. Milner's autostimulation method was used on 35 white rats in order to procure a quantitative estimate of emotional behavior and be able to characterize the degree of functional activity of the cerebral structures, related to the integration of behavioral acts and emotions. The method facilitates estimation of the number, size, and spatial organization in the brain of centers of motivation and emotions. Systems of reinforcement are located in the mesencephalic reticular formation (MRF), septum, anterior hypothalamus, and, more compactly, in the posterior hypothalamus. A relative hierarchy of active zones of Olds exist, located in different structures of the limbicorecticular complex. The MRF, the central gray matter, and the posterior hypothalamic region facilitate the general functional activity of the Olds diencephalic centers, connected with emotional behavior. The hippocampus is capable of modulating the functional activity of the emotionally positive zones of the posterior hypothalamus, lowering the activity of its ventrolateral region and slightly facilitating that of its ventromedial region. The hippocamposeptal complex provides for primarily the inhibitory mechanisms of the Olds emotional centers. The data suggest that within the bounds of the limbicorecticular system differentiated relationships and a hierarchy exist, directed toward fine regulation of the activity of differentiated positive zones connected with the autostimulatory reaction.—*I. D. London.*

5688. Zuckermann, Emil C. & Glaser, Gilbert H. (Yale U., Medical School) *Slow potential shifts in dorsal hippocampus during "epileptogenic" perfusion of the inferior horn with high-potassium CSF.* *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 236-246.—Recorded slow potential shifts and responses to ipsi- and contralateral stimulation of dorsal hippocampus from basal and apical dendritic layers in 15 awake cats, using chronically implanted pipettes. Perfusion of the inferior horn with cerebrospinal fluid in which K⁺ concentration was raised from normal 3 mEq/l to 9-18 mEq/l induced, after 20-50 sec., an early DC shift (1-3 mV) only in the basal dendritic layer, reaching a plateau after 2-3 min. During this time no changes in the pattern of hippocampal evoked responses were observed. However, while the DC level was constant, large potentials, negative in basal dendrites and positive in apical dendrites, gradually developed in response to single stimuli, reaching a peak in 6-15 min. when a seizure discharge was triggered. During the last minute preceding the initiation of

paroxysmal discharge, the main transient of each response was followed by a long-lasting negative wave from basal dendrites and a synchronous positive wave from apical dendrites. Simultaneously another DC shift occurred by the overlapping of these late waves. Paroxysmal discharges then were superimposed on this DC shift. After the perfusion was discontinued, the excitability remained increased as 3/sec stimuli were able to trigger seizure discharges. During this same period the DC level in the apical dendritic layer did not change significantly but that from the basal layer slowly shifted to above its initial value. It is assumed that the initial DC shift, recorded only from the periventricular electrodes, was connected with changes in ependymovascular membranes, and that the K⁺ increased epileptogenic excitability by another mechanism than a global gradual depolarization of neurons. The slow potential shift accompanying the seizure was generated apparently by the development of paroxysmal depolarization and hyperpolarization shifts at the level of basal and apical dendrites.

5691. Balzano, E. & Jeannerod, M. (Centre National de Recherche Scientifique, Inst. de Neurophysiologie, Marseille, France.) *Activité multi-unitaire de structures sous-corticales pendant le cycle veille-sommeil chez le chat.* [Multi-unit activity of subcortical structures during the waking-sleep cycle of the cat.] *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 136-145.—Studied spontaneous multiunit discharges during the sleep-wakefulness cycle in cats with electrodes chronically implanted in pontine (PRF) and mesencephalic (MRF) reticular formations, raphe nuclei, and hypothalamus. Discharges were transformed into a continuous integration curve in which voltage was a function of frequency and amplitude. During slow wave sleep (SWS), the curve lowered progressively for all structures. During the transition between SWS and paradoxical sleep (PS), the curve showed: (a) progressive elevation for raphe nuclei 20-30 sec. before onset on PS, (b) an increase occurring in MRF and hypothalamus at the time of cortical activation, (c) no change for the PRF, and (d) a decrease for anterior hypothalamus. During PS the curve was tonically elevated for raphe nuclei, MRF, and hypothalamus, but remained at the SWS level for PRF.

During the phasic events of PS, sudden peaks of higher voltage were found predominantly in the PRF, where they were the only variation observed. Phasic phenomena induced by administration of reserpine were also accompanied by peaks of the curve, but only for the PRF. With regard to PS, results suggest that the raphe nuclei play an inducing role, the MRF is implicated in maintenance of cortical activation, and PRF is a source of the brief depolarizations associated with phasic phenomena. (39 ref.)—English summary.

5692. Bennett, M. V., Hille, Bertil, & Obara, S. (Albert Einstein Coll. of Medicine, Yeshiva U.) *Voltage threshold in excitable cells depends on stimulus form.* *Journal of Neurophysiology*, 1970(Sep), Vol. 33(5), 585-594.—A model excitable system is a capacitor in parallel with a "negative-slope element" that rapidly reaches an "N-shaped" steady-state current-voltage relation containing a region of negative slope. These predictions are realized experimentally using a capacitor plus a tunnel diode or a potassium-depolarized electroplaque with an N-shaped current-voltage relation. The same effects are demonstrated in a node of Ranvier and a normal electroplaque, although current-voltage relations for these membranes are only transiently N-shaped after a depolarization. Dependence of voltage threshold on both synaptic and applied currents must be considered in its experimental measurement.—G. Westheimer.

(Parke, Davis & Co., Research Lab., Ann Arbor, Mich.) *Solid miniature silver-silver chloride electrodes for chronic implantation.* *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 206-208.—Describes a simple method for constructing miniature nonpolarizable electrodes suitable for chronic implantation in laboratory animals. Favorable electrical characteristics of the electrodes are described. An example of records obtained from an implanted cat is presented which demonstrates long-term reliable monitoring of DC potentials from the brain. (French summary)—Journal summary.

5694. Chinaev, P. I., et al. *Preobrazovanie nepreryvnykh funktsii s pomoshch'yu iskusstvennykh neuronnykh setei.* [Transformation of continuous functions with the aid of artificial neuronal networks.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 186-195.—Analyzes the data of electrophysiological research on the excitability of nerve tissue, and describes the reaction of the tissue to stimuli of simple form as well as types of reactions which render secure the coding of the informational indices for the temporal function. The results of modeling these reactions with the aid of artificial neuronal networks are presented along with a number of oscillograms, confirming the similarity between the reactions of the artificial networks to the input signal and those of their biological prototypes. Analyzed are functional schemata for networks of neuroniform elements, capable of detecting and coding the informational components of the temporal function. Such networks can be utilized as a means for the "discretization" of continuous signals.—I. D. London.

5695. Daurova, F. K. & Gasanov, U. G. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Elektrofiziologicheskoe issledovanie vozbudimosti korkovogo kontsa slukhovogo analizatora v usloviyakh "pokrytiya."* [Electrophysiological study of the excitability of the cortical terminus of the auditory analyzer under conditions of "cover."] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 580-586.—5 immobilized cats, with and without pre-

vously elaborated positive winking CRs to clicks, were used to study the thresholds of primary responses in the auditory cortex under conditions of "cover," i.e., in the course of backward conditioning where unconditioned excitation preceded the "covered" stimulus. It is shown that, after many pairings of clicks with air puffs in the eye in reverse sequence (air puff, clicks), the thresholds of the primary responses in the auditory cortex markedly increased in both groups of Ss. Some thoughts are ventured on the formation of a new functional state in the cortical elements which pick up the "covered stimulus" (clicks) in backward conditioning.—I. D. London.

5696. Davis, Floyd A. (U. Illinois, Medical School, Chicago) Axonal conduction studies based on some considerations of temperature effects in multiple sclerosis. *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 281-286.—Performed electrophysiologic studies on isolated single lobster axons to determine the effect of temperature on conduction at the site of mechanical and thermal lesions. The block of conduction produced by these lesions is remarkably sensitive to small changes in temperature. Conduction can be restored by cooling the nerve, whereas with rewarming the block returns. Less than a 1° C change can determine whether conduction will occur. It is suggested that cooling may increase the safety factor of conduction enabling the impulse to jump over an injured area. Results support a hypothesis that the change in signs and symptoms with a change of body temperature in multiple sclerosis may be caused by an effect of temperature on axonal conduction. 5697. Gusel'nikova, K. G., et al. (Moscow State U., USSR) O nekotorykh svoistvakh dendritov neironov obonyatel'noi lukovitsy lyagushki. [On some properties of the dendrites of neurons in the olfactory bulb of the frog.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1465-1470.—An intracellular microelectrode study, with recordings of 67 neurons located in the olfactory bulb of the frog: *Rana temporaria* and *R. ridibunda*. It is shown that the dendrites of the secondary and internuncial neurons of the frog olfactory bulb are synaptically excitable. The dendritic spike emerged when it was more distal to the 1st branching of the dendrites and was propagated in the orthodromic direction. The dendritic spike, evoked by weak stimulation, could be blocked in the dendritic furcational node. (English summary) (22 ref.)—I. D. London.

5698. Gutman, A. & Milyukas, V. (Medical Inst., Kaunas, USSR) Del'ta-volna kak summa vnekletochnykh potentsialov piramidnykh neironov: Teoreticheskaya otsenka amplitudy. [The delta-wave as the sum of extracellular potentials of pyramidal neurons: A theoretical estimation of amplitude.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 671-678.—Presents a mathematical analysis attempting to provide a quantitative expression of electrocorticogram potential as a function of intracellular potentials, in order to confirm the hypothesis that the delta-wave is a consequence of the postsynaptic potential of the pyramidal bodies, i.e., a change in polarization of the bodies of the pyramidal cortical cells. A formula is derived for transcortical potential for the simple case of uniform polarization of pyramidal cells over a large flat area of the cortex. A formula for purposes of calculation is also derived. The analysis is deliberately limited to delta-

activity, since here cellular discharges are maximally synchronized, thus leading to avoidance of the indefiniteness connected with the introduction of degree of synchronization.—I. D. London.

5699. Hillyard, Steven A. & Galambos, Robert. (U. California, Medical School, San Diego) Eye movement artifact in the CNV. *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 173-182.—During the preparatory interval between a warning click and a tone burst that signaled a lever press, a slow negative potential shift (contingent negative variation—CNV) was recorded from the scalp in 10 normal adults. When the eyes were closed, involuntary eye movements during the click-tone interval consistently generated potential shifts which spread from the corneo-retinal dipole to the scalp electrodes and thereby contaminated the CNV. The CNV was quantitatively partitioned into an artifactual component caused by ocular rotation (eye artifact potential—EAP), which summated with the 2nd component, presumably of cerebral origin, called the "true" or tCNV. The EAP amplitudes were estimated from concurrent recordings of the electrooculogram. In the average S, 23% or -6.1 μ V of the total CNV was comprised of EAP, and the EAP often reached from -10 to -15 μ V. The accuracy of the partition was verified by comparing tCNVs recorded with eyes closed and with eyes immobilized by fixation. The CNV produced during voluntary eye movements was similarly divided into a tCNV, which was tripled in amplitude when ocular responses were made with increased speed and effort, and an EAP, determined solely by the amount of ocular displacement. (French summary) (31 ref.)—*Journal summary*.

5700. Hirano, T., Best, P., & Olds, J. (Osaka City U., Japan) Units during habituation, discrimination learning, and extinction. *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 127-135.—Recorded unit responses with 62.5 μ fine wires implanted chronically in 15 rats. In each S, simultaneous recordings were made in hippocampus, midbrain, hypothalamus, and preoptic area. Results show that: (a) In hippocampus, there was no special response to novel stimuli, response increments appeared rapidly during conditioning, a difference developed between firing rates induced by CS+ and CS- control stimulus, and complete extinction of the increments in firing rates did not occur. (b) In midbrain, units initially responded to novel stimuli, and then showed continuous habituation; rate of discharge increased during conditioning, and a difference between patterns of firing induced by CS+ and CS- developed gradually and disappeared during extinction. (c) Hypothalamic units showed patterns of neuron responses similar to those of midbrain units but less pronounced. (d) Preoptic units showed relatively small responses to novel stimuli; these disappeared rapidly during habituation and no further responses occurred in conditioning or extinction trials. (French summary)—*Journal summary*.

5701. Humphrey, Donald R., Schmidt, E. M., & Thompson, W. D. (National Inst. of Neurological Diseases & Stroke, Bethesda, Md.) Predicting measures of motor performance from multiple cortical spike trains. *Science*, 1970(Nov), Vol. 170(3959), 758-762.—Obtained recordings simultaneously from several, individually selected neurons in the motor cortex of an unanesthetized monkey as he performed simple arm movements. With the use of comparatively simple

quantitative procedures, the activity of small sets of cells was found to be adequate for rather accurate real-time prediction of the time course of various response measurements. In addition, results suggest that hypotheses concerning the response variables controlled by cortical motor systems may depend upon whether or not the temporal relations between simultaneously active neurons are taken into account. (16 ref.)—*Journal abstract.*

5702. Irwin, Donald A. & Rebert, Charles S. (Southern Illinois U.) **Slow potential changes in cat brain during classical appetitive conditioning of jaw movements using two levels of reward.** *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 119-126.—Recorded slow potential changes (SPCs) from epidural motor cortex and subcortical areas in 24 mature, healthy cat brains. Before conditioning, a CS, elicited SPCs from the lateral hypothalamic area, the medial and the lateral amygdala. Tone-evoked SPCs did not occur in motor cortex, ventromedial hypothalamus and mesencephalic reticular formation. During conditioning, CS-evoked negative SPCs from motor cortex became increasingly larger in Ss receiving a large reward, but not in Ss receiving a small reward or pseudoconditioning. CS-evoked positive SPCs became larger in the lateral hypothalamic area in both reward groups, and were larger than those shown by a pseudoconditioning group. SPCs evoked by the CS and correlated with conditioning did not develop in the mesencephalic reticular formation, ventromedial hypothalamus, nor in medial and lateral amygdala. After conditioning, positive SPCs were shown to occur as responses to a large reward in motor cortex, lateral hypothalamus, and medial amygdala. The mesencephalic reticular formation responded to both reward levels with positive SPCs that did not differ significantly in magnitude. SPCs did not occur as responses to reward in lateral amygdala nor ventromedial hypothalamus. Results are discussed in terms of neuroanatomical specificity in the generation of subcortical SPCs and the motivating conditions necessary for the occurrence of SPCs in both cortical and subcortical areas. (French summary) (20 ref.)—*Journal summary.*

5703. Kas'yanov, V. M. & Pichkhadze, R. I. (Lenin Pedagogical Inst., Moscow, USSR) **Osobennosti sovместnoy raboty bol'shikh polushari pri formirovani dinamicheskogo stereotipa.** [Features of the joint activity of the cerebral hemispheres in formation of a dynamic stereotype.] *Zhurnal Vysshe Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 250-256.—Used 3 dogs, with "strong equilibrated quiet type" of nervous system to study the joint activity of the cerebral hemispheres in the formation of "systemic processes" (alimentary CRs to a stereotypic complex of stimuli) in the cortex. Complex stereotype of stimuli were employed: bell, buzzer, tactile stimulation of left thigh, same for right thigh at a symmetrical point, rhythmic flashes of light (150 W.), sound of bubbling. All stimuli served as positive signals, excepting the differential signals of buzzer and tactile stimulation of the right thigh. 3 phases were disclosed in the joint activity of the hemispheres in the process of forming a dynamic stereotype. Phase 1 was characterized by the elaboration of CRs to only separate components of the stereotype. A CR to an acoustic stimulus was developed sooner; to a dermatotactile stimulus later. In this phase, the hemispheres exhibited asymmetrical and nonconcordant activity

(chaotic secretory reactions). In Phase 2, positive CRs appeared to all components of the stereotype, while the negative CRs, in the form of differential internal inhibition, were unformed. The paired character of hemispheric function was manifested in the form of primarily asymmetrical reactions with dextral dominance. The magnitude of the secretory reactions declined and that of the latent periods increased. Phase 3 was characterized by marked stereotypic symmetrical reactions along with increased secretion and decreased latent periods of secretion. Restlessness in behavior disappeared, and instances of refusal to eat were reduced. Differential inhibition was formed only in Phase 3 when stereotypic reactions had been established to all the positive stimuli. Salivation in this phase, in response to a differential stimulus (buzzer), was slight with long latent periods and mainly asymmetrical manifestation. Null effects were often manifested in only 1 salivary gland.—I. D. London.

5704. Kots, Ya. M. (State Central Inst. of Physical Culture, Moscow, USSR) **Spinal'naya "nastroika" pered proizvol'nym fazicheskim dvizheniem, vypolnyaemym posle staticheskogo usiliya.** [Spinal "priming" before voluntary phasic movement, made after the application of static force.] *Zhurnal Vysshe Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 363-365.—Presents an EMG study of spinal "priming" before voluntary phasic movement (quick pressing of a pedal in response to a photic signal) against a background of initial impulse activity of the motoneuronal nucleus, resulting from light pressure against the pedal by the S through application of a constant force, controlled by a pointer dynamometer. Spinal "priming" is the gradual rise of reflex excitability of the spinal motoneurons of the muscle antagonists, preceding the onset of voluntary phasic movement (level of excitability indexed by amplitude of the reflex H response of the gastrocnemius muscle). Data indicate that the supraspinally directed transition of the motoneuronal nucleus from a state of rest to impulse activity or its transition from 1 level of nuclear activity to another is connected with preliminary priming of the reflex excitability of the motoneurons, lasting about 60 msec. Such "inertness" of spinal priming should be considered when analyzing the possibility and frequency of ongoing supraspinal corrections introduced into the course of voluntary motor performance.—I. D. London.

5709. Mainwood, G. W. & Lee, S. L. (U. Ottawa, Ontario, Canada) **Rat heart papillary muscles: Action potentials and mechanical response to paired stimuli.** *Science*, 1969(Oct), Vol. 166(3903), 396-397.—In an experiment studying the effects of paired pulses, it was found that electrical reexcitation of rat papillary muscle after a short interval (50-80 msec.) resulted in action potentials with no significant mechanical counterpart. The mechanical response recovered as the interval increased beyond 80 msec. The rate of recovery was slowed at low external calcium levels. It appears that the coupling mechanism passes through a refractory stage owing to the depletion of an intracellular "releasable calcium" fraction.—*Journal abstract.*

5710. Makarov, P. O. (Leningrad State U., USSR) **Interval vozbuzhdeniya i sovozbuzhdeniya pri sverkhshil'nykh razdrzheniyakh analizatorov cheloveka.** [Interval of excitation and coexcitation in superintense stimulation of the human analyzers.] *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1969, Vol. 19(2), 301-304.—4 21-37 yr. old Ss participated in the study. Superintense brief optic stimulation, eliciting a painful reaction, produced in the visual system prolonged consequences (traces) in the form of changes in excitability, 100s and 1000s of times greater than the traces resulting from usual threshold and moderate stimulation. These traces had a phasic character: lowering of excitability is replaced by its heightening. In superintense stimulation prolonged phasic changes in excitability were observed in the stimulated sensory organ, and in neighboring sensory organs, not stimulated by the presented stimulus. Superintense stimulation of the eye produced changes in the excitability of the auditory and cutaneous analyzers. Similar results are obtained in the case of superintense acoustic and electrodermal stimuli. The interval of functional changes in the stimulated sensory organ is called the "interval of excitation" to distinguish it from the interval of functional changes in the neighboring sensory organs, called the "interval of coexcitation."—*I. D. London.*

5711. Mano, Nori-ichi. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **Changes of simple and complex spike activity of cerebellar Purkinje cells with sleep and waking.** *Science*, 1970(Dec), Vol. 170(3964), 1325-1327.—Observed action potentials of cerebellar Purkinje cells in 3 intact monkeys during sleep and waking. Simple-spike activity (generated by the parallel fiber inputs to the Purkinje cell) was highest during sleep with REMs as compared with both waking and sleep with EEG slow waves. In contrast, complex-spike activity (generated by the climbing fiber inputs to the Purkinje cell) was lowest during sleep with REMs. The complex action potential of the Purkinje cell consists of an initial large spike

followed by 1 or more smaller secondary spikes, and the number of these secondary spikes was found to be independent of the background discharge frequency of the simple spike. This independence suggests a possible role of presynaptic factors rather than the excitability level of the Purkinje cell itself in determining the number of secondary discharges occurring in the complex spike.—*Journal abstract.*

5712. Marczyński, T. J., York, J. L., & Hackett, J. T. (U. Illinois, Medical School, Chicago) **Steady potential correlates of positive reinforcement: Reward contingent positive variation.** *Science*, 1969(Jan), Vol. 163(3864), 301-304.—A positive reinforcement with food produced high-voltage bursts of alpha activity over the posterior marginal gyrus in 6 cats deprived of food and water. This synchronization was always associated with a large (180-300 micro-V), positive steady potential shift comparable to that occurring during the onset of sleep. Since this shift was contingent upon the relative appropriateness and desirability of food reward, it was termed reward contingent positive variation. (16 ref.)—*Journal abstract.*

5713. Miller, Merrill M. & Levine, Ralph. (Stanford U., Medical Center) **Sleep analysis and a simple technique for selective deprivation of low-voltage fast-wave sleep in a species of deermouse P. m. bairdi.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 112-120.—In Exp. I electrocorticographic (ECOG) and EMG records were time-sampled from each of 3 P.m. bairdi when motionless with eyes closed. 60 5-sec intervals were categorized, by standard qualitative criteria, into 3 arousal states: low-voltage, fast-wave sleep (LVF); high-voltage, slow-wave sleep (HVS); or waking (W). Independently, each electrophysiological index was scored quantitatively either by counting large changes in ECOG potential or by rating intensity of EMG activity. Analyses indicate that the count and rating patterns were strongly associated with the initial qualitative judgments of arousal state, and that low EMG activity was concomitant with LVF. It was hypothesized that LVF could be reduced by curtailing low levels of muscle tonus. Exp. II tested such an hypothesis with 3 more P. m. bairdi. 60 5-sec ECOG and EMG records were similarly sampled (when S's eyes were closed), categorized, and independently quantified. Each S was perched over a shock-grid on a pedestal too small to permit total loss of muscle tonus. Records show only HVS and W but in ratios slightly altered from those observed for the 1st 3 Ss. Comparison of results suggests that, by preventing low muscle tonus, the pedestal-over-shock-grid can radically reduce the proportion of LVF in the sleep of P. m. bairdi.—*Journal abstract.*

5715. Noda, Hiroharu & Adey, W. Ross. (U. California, Los Angeles) **Firing of neuron pairs in cat association cortex during sleep and wakefulness.** *Journal of Neurophysiology*, 1970(Sep), Vol. 33(5), 672-684.—Spontaneous discharges of neuronal pairs in

association (middle suprasylvian) cortex of the cat were recorded simultaneously with single microelectrodes and individual units were separated on the basis of their amplitude difference. During deep (slow wave) and intermediate (spindle) sleep there was a high probability of correlated firing with increased concurrent appearance of long periods of inactivity in the neuronal pairs. With a shift from sleep to wakefulness, correlation of silent periods between units was reduced and there was decreased probability of correlated firings. In this state, though long inactive periods appeared in individual neurons, they did not occur simultaneously. In behavioral arousal or in REM sleep (paradoxical sleep), the neuronal pairs discharged quite independently and the temporal patterns showed minimal correlation.—G. Westheimer.

5716. O'Gorman, J. G., Mangan, G. L., & Gowen, Joan A. (U. Queensland, St. Lucia, Brisbane, Australia) **Selective habituation of galvanic skin response component of the orientation reaction to an auditory stimulus.** *Psychophysiology*, 1970(May), Vol. 6(6), 716-721.—Tested the prediction from E. N. Sokolov's theory that, following orientation reaction (OR) habituation, size of OR return is proportional to the amount of difference between the new stimulus and the habituating stimulus using an auditory stimulus varying in frequency and intensity. 5 17-23 yr. old female undergraduates were allocated to each of 16 conditions (total N = 80), 3 conditions involving changes in frequency, 3 involving changes in intensity, 9 involving changes in both frequency and intensity, with 1 control condition involving a repetition of the habituating stimulus. Following habituation of the GSR component of the OR to a criterion of response failure for 3 successive trials, magnitude of GSR under the 16 conditions was measured. Contrary to E. N. Sokolov's theory, only increase in intensity had a significantly different effect on OR return. It was found that Ss habituating rapidly to the initial stimulus were less likely to show OR return to stimulus change. It is concluded that individual differences in habituation rate may be more important than stimulus difference effects in selective habituation.—*Journal abstract.*

5717. Peacock, Samuel M. (Eastern Pennsylvania Psychiatric Inst., Philadelphia) **Averaged "after-activity" and the alpha regeneration cycle.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 287-295.—Stimulated 30 adults and children by repetitive flash and averaged the visual evoked response to study the relationship between after-activity and the alpha rhythm. Data suggest that after-activity is the averaged development of alpha regeneration following flash-induced block. A build-up of averaged response and after-discharge in linear relationship to the number of stimuli was not confirmed, nor was lateralization of this build-up observed. After-activity was seen to occur during the course of the long flash and cannot be considered an off response. It is suggested that the after-discharge well known in animal work is not seen in the human occipital cortex in response to flash, but rather with repetitive stimulation the alpha regeneration cycle is of sufficient stability to result in averaging of its stimulus-locked regeneration. 5719. Smirnov, G. D., Mazurskaya, P. Z., & Kalantar, V. A. (Inst. of Evolutionary Morphology & Animal Ecology, Moscow, USSR) **Vliyaniye intensivnosti svetovyykh stimulov na reaktzii neironov zritel'noi kory krolika.** [Influence of intensity of photic stimuli on neuronal reaction in the rabbit visual cortex.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 627-634.—Ss were 25 immobilized rabbits and 120 visual cortical neurons were subjected to a microelectrode investigation in order to determine (a) change in the total number of spikes in neuronal reaction to photic stimuli of different brightness, (b) duration of the reaction, (c) temporal distribution of impulses after presentation of the photic stimulus, and (d) latent period of the response. In studying neuronal reaction in the visual cortex as a function of brightness of light, 3 groups of neurons were distinguished: those with gradual, selective, and monotonic types of reaction. In gradual type neurons, with increase in photic intensity, the number of impulses in the response increased along with the afteraction, while dispersion decreased along with the absolute value of the latent periods of the reaction. In neurons of the selective group, which reacted selectively to definite intensities of light and which were the most numerous, the greatest reaction may result from response to any illumination in the presented repertoire of brightnesses, including even the weakest illumination. In the monotonic group, reaction to the presentation of light with different brightness levels was the same. Judged by a number of indices (the number of spikes in the reaction, the magnitude of the afteraction, and temporal distribution of impulses), the selected neurons were primed to react to a definite brightness. In a number of cases a great degree of priming was detected: the reaction changed considerably with increase or decrease in brightness.—I. D. London.

5720. Sokolov, E. N. & Dubrovinskaya, N. V. (Moscow State U., USSR) **Ritmicheskiy razryad v perednem dvukholmii krolika.** [Rhythmic discharge in the anterior colliculi of the rabbit.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 328-336.—Used 11 narcotized rabbits to supply extracellular recordings of 60 anterior collicular neurons: (a) reactions to a singly presented flash of light, (b) changes of response in the course of 10 presentations of the stimulus, (c) reaction to different intensities of the stimulus (3-4 levels of brightness), and (d) restoration cycles and reactions to rhythmic photic stimulation. A description of the various light flashes employed are provided. Parallel recordings of spike and slow activity in the anterior colliculi disclosed neurons (12% of the recorded 60) which react to a flash of light with a rhythmic discharge, consisting of a series of 7-10 successive compact bundles of spikes. A correlation existed between bundles of action potentials and the negative components of oscillatory evoked potential, along with a correlation between intergroup intervals and the positive components. The stability of the discharge was demonstrated when the intensity of the stimulus was changed. Paired light flashes and rhythmic stimulation were utilized to demonstrate the independence of generation of the separate bundles of rhythmic

5715. Noda, Hiroharu & Adey, W. Ross. (U. California, Los Angeles) **Firing of neuron pairs in cat association cortex during sleep and wakefulness.** *Journal of Neurophysiology*, 1970(Sep), Vol. 33(5), 672-684.—Spontaneous discharges of neuronal pairs in

association (middle suprasylvian) cortex of the cat were recorded simultaneously with single microelectrodes and individual units were separated on the basis of their amplitude difference. During deep (slow wave) and intermediate (spindle) sleep there was a high probability of correlated firing with increased concurrent appearance of long periods of inactivity in the neuronal pairs. With a shift from sleep to wakefulness, correlation of silent periods between units was reduced and there was decreased probability of correlated firings. In this state, though long inactive periods appeared in individual neurons, they did not occur simultaneously. In behavioral arousal or in REM sleep (paradoxical sleep), the neuronal pairs discharged quite independently and the temporal patterns showed minimal correlation.—G. Westheimer.

5716. O'Gorman, J. G., Mangan, G. L., & Gowen, Joan A. (U. Queensland, St. Lucia, Brisbane, Australia) **Selective habituation of galvanic skin response component of the orientation reaction to an auditory stimulus.** *Psychophysiology*, 1970(May), Vol. 6(6), 716-721.—Tested the prediction from E. N. Sokolov's theory that, following orientation reaction (OR) habituation, size of OR return is proportional to the amount of difference between the new stimulus and the habituating stimulus using an auditory stimulus varying in frequency and intensity. 5 17-23 yr. old female undergraduates were allocated to each of 16 conditions (total N = 80), 3 conditions involving changes in frequency, 3 involving changes in intensity, 9 involving changes in both frequency and intensity, with 1 control condition involving a repetition of the habituating stimulus. Following habituation of the GSR component of the OR to a criterion of response failure for 3 successive trials, magnitude of GSR under the 16 conditions was measured. Contrary to E. N. Sokolov's theory, only increase in intensity had a significantly different effect on OR return. It was found that Ss habituating rapidly to the initial stimulus were less likely to show OR return to stimulus change. It is concluded that individual differences in habituation rate may be more important than stimulus difference effects in selective habituation.—*Journal abstract.*

5717. Peacock, Samuel M. (Eastern Pennsylvania Psychiatric Inst., Philadelphia) **Averaged "after-activity" and the alpha regeneration cycle.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 287-295.—Stimulated 30 adults and children by repetitive flash and averaged the visual evoked response to study the relationship between after-activity and the alpha rhythm. Data suggest that after-activity is the averaged development of alpha regeneration following flash-induced block. A build-up of averaged response and after-discharge in linear relationship to the number of stimuli was not confirmed, nor was lateralization of this build-up observed. After-activity was seen to occur during the course of the long flash and cannot be considered an off response. It is suggested that the after-discharge well known in animal work is not seen in the human occipital cortex in response to flash, but rather with repetitive stimulation the alpha regeneration cycle is of sufficient stability to result in averaging of its stimulus-locked regeneration. (Moscow State U., USSR) **Ritmicheskiy razryad vperednem dvukholmnoy krolika.** [Rhythmic discharge in the anterior colliculi of the rabbit.] *Zhurnal Vysshey Nervnoy Deyatel'nosti*, 1969, Vol. 19(2), 328-336.—Used 11 narcotized rabbits to supply extracellular recordings of 60 anterior collicular neurons: (a) reactions to a singly presented flash of light, (b) changes of response in the course of 10 presentations of the stimulus, (c) reaction to different intensities of the stimulus (3-4 levels of brightness), and (d) restoration cycles and reactions to rhythmic photic stimulation. A description of the various light flashes employed are provided. Parallel recordings of spike and slow activity in the anterior colliculi disclosed neurons (12% of the recorded 60) which react to a flash of light with a rhythmic discharge, consisting of a series of 7-10 successive compact bundles of spikes. A correlation existed between bundles of action potentials and the negative components of oscillatory evoked potential, along with a correlation between intergroup intervals and the positive components. The stability of the discharge was demonstrated when the intensity of the stimulus was changed. Paired light flashes and rhythmic stimulation were utilized to demonstrate the independence of generation of the separate bundles of rhythmic

discharge. It is suggested that the rhythmic discharge of the anterior colliculi is connected with the functional organization of the receptive field of the retinal neurons, which selectively react to a definite speed of movement of an object in the visual field.—*I. D. London.*

5722. Uno, Tadao. (Baylor U.) **The effects of awareness and successive inhibition on interoceptive and exteroceptive conditioning of the galvanic skin response.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 27-43.—Examines the conclusion from Soviet studies of interoceptive conditioning that interoceptive conditioning is unconscious, established at a slower rate, and is more resistant to extinction than exteroceptive conditioning. 48 paid volunteer Ss were classically conditioned to both interoceptive (0 and 50° C water in an intubated balloon located between the bronchial and diaphragmatic constrictions of the esophagus) and exteroceptive CSs (256- and 512-Hz tones at 60 db.). Significant intero- and exteroceptive conditioning of the GSR was obtained using responses occurring within the interstimulus or 1st interval (FIR) as well as the post-UCS or 2nd interval (SIR). FIR conditioning progressed at a slower rate to intero- than to exteroceptive stimulation whereas SIR conditioning was equally effective to both modes of stimulation. Unawareness of interoceptive stimulation or their reinforcement contingencies tended to eliminate FIR but not SIR conditioning. Although not statistically supported, successive inhibitory-excitatory compounding of intero- and exteroceptive CSs indicated stronger response tendencies to the interoceptive CSs when equated to exteroceptive conditioning strength. Results demonstrate the complexity of GSR conditioning when CS modality, response types, and awareness of CS-UCS contingencies are considered. (23 ref.)—*Journal abstract.*

5723. van Wulfften Palthe, P. M. **The psychogalvanic reflex as alarm system.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Jan), Vol. 72(1), 161-166.—Describes a self-contained device and procedure for measuring skin resistance which can be used as an alarm system in cases where continuous alertness is necessary. A study on the influence of music on an individual in solitude illustrates the practical application of the psychogalvanic reflex.

5724. Voronin, L. L. & Solntseva, E. I. (Inst. of the Brain, Moscow, USSR) **Sledovye éffekty posle polarizatsii otdel'nykh néyronov kory: Vnekletochnoe otvedenie.** [Trace effects after polarization of single cortical neurons: Extracellular recording.] *Zhurnal Vysheí Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 611-620.—In the greater part of the 136 neurons under study (Ss were unnarcotized rabbits) after both excitatory and inhibitory current prolonged changes of activity in the form of heightened and lowered frequency of discharges were noted in comparison with the initial level. With currents having a duration of not more than 20-30 sec., mean duration of afteraction was close in value to the duration of polarization. With prolonged (5-10 min.) polarization,

duration of the afteraction did not exceed 2-3 min. Trace effects were especially well expressed in neurons, which showed, against a background of current action, considerable changes in discharge frequency in the direction of heightening (gradual activation or "escape from inhibition"). No reliable changes in trace effects were observed after the administration of 30-40 mg/kg of nembutal. The findings are discussed in the light of other work using intracellular microelectrodes. It is suggested that trace effects, after both extracellular and intracellular polarization, are explainable not by the circulation of impulses in neuronal nets, but by the adaptive properties of excitable membrane. The 2 forms of effect after cessation of unidirectional extracellular current are explained by the fact that such current has a double action, depolarizing some parts of the membrane and hyperpolarizing others.—*I. D. London.*

5725. Wasman, Marvin; Morehead, Sherrod D., Lee, Ho-Young, & Rowland, Vernon. (Case Western Reserve U.) **Interaction of electro-ocular potentials with the contingent negative variation.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 103-111.—Recorded the contingent negative variation (CNV) from the vertex in 45 undergraduates and nurses during a 2-stimulus expectancy paradigm under varying conditions of eye closure and fixation. Simultaneously averaged electrooculograms (EOG) were recorded as a measure of eye movement. The amplitude of both CNV and EOG responses was significantly greater for the eyes closed and eyes open unfixed conditions as compared to the eyes fixated condition. CNV and EOG responses were often highly similar in terms of waveform. For the eyes fixated condition 3 patterns of CNV-EOG interaction were observed. 18 Ss demonstrated a CNV response of low amplitude in the absence of detectable EOG responses. 23 Ss showed a predominant pattern in which CNV responses of high amplitude and EOG responses were present. 4 Ss failed to show either a CNV or EOG response. There was considerable within S variability in the pattern of response with replicated blocks of trials. Thus contamination of the CNV by EOG potentials is reduced by eye fixation but not eliminated because of S variability in control of eye movement. (18 ref.)—*Journal abstract.*

Electroencephalography & Evoked Potentials

5726. Batuev, A. S. (Leningrad State U., USSR) **Lobnye doli bol'shikh polusharii kak apparat mezhanalizatornoi integratsii.** [The cerebral frontal lobes as apparatus for interanalyzer integration.] *Zhurnal Vysheí Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 270-278.—Used 7 adult dogs and 2 3-mo-old puppies to study the participation of the cerebral frontal lobes in the organization of alimentary motor CRs to a complex of simultaneous heteromodal stimuli (visual and auditory). Evoked potentials were recorded from the surface of the frontal cortex, the gigantopyramidal field, the temporal and occipital regions. The processes of interanalyzer integration were studied after ablation of different parts of the cortical section of the motor analyzer, including the frontal lobes. CRs to the simultaneous heteromodal complex (light + sound) and extinction of their components were slightly affected after extirpation of the gigantopyramidal field, but were sharply disrupted after frontal lobectomy. Along with its disturbance of inter-

analyzer synthesis, lobectomy produced no noticeable motor disorders. The degree of disorder of "analytico-synthetic activity" is a function of the dimensions of extirpation of the frontal lobes and the degree of cerebral maturation at the time of the operation. Recordings of evoked potentials in Ss under chloralose-nembutal narcosis disclose a convergence of auditory, visual, and dermomuscular afferent systems in the structures of the frontal cortex and in the gigantopyramidal field.—*I. D. London.*

5727. Belousova, Zh. A. (Medical Inst., Gorki, USSR) **K voprosu o lokalizatsii vyzvannykh potentsialov na svetovye razdrazheniya v kore bol'shikh polusharii.** [On localization of evoked potentials in response to photic stimulation in the cerebral cortex.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 707-709.—Utilized the Laplacian method to determine the actual locale of evoked potentials in response to light flashes in the cerebral cortex of 13 nembutalized cats. There was a considerable difference in localization of evoked responses when recorded by the Laplacian and the usual monopolar method. The latter method did not exclude registration of "passively propagating currents." The region for picking up true evoked responses to photic stimulation under nembutal narcosis was bounded by the cortical projection zone and the middle suprasylvian gyrus, excluding its anterior third.—*I. D. London.*

5728. Bert, J., Kripke, D. F., & Rhodes, J. (60 Ave. Cantini, Marseilles, France) **Electroencephalogram of the mature chimpanzee: Twenty-four hour recordings.** *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 368-373.—Obtained 24-hr EEG recordings from 3 sexually mature chimpanzees. Telemetry permitted the study of unrestrained Ss in their home cages, during both sleep and wakefulness. Ss slept a mean of 9 hr. 40 min. at night, but hardly at all during the day. The sleep EEG of Ss contained very few sigma rhythms, vertex sharp waves and K complexes as compared with adult human Ss or juvenile chimpanzees. Awakenings were very frequent, amounting to 17% of the sleep periods, and episodes of each stage were short because of frequent stage shifts. Stage REM occupied only 15% of the sleep recorded. Although findings confirm the general similarity of chimpanzee sleep patterns to those of humans, the records were actually more similar to recordings of lower primates. It is hard to explain these findings phylogenetically, and they may reflect the effects of captivity on laboratory animals. (French summary)—*Journal summary.*

5729. Birbaumer, Niels. (Vienna U., Inst. of Psychology, Austria) **Präventive Alpha-Inhibition und Angst.** [Prevention of alpha-inhibition and anxiety.] *Studia Psychologica*, 1970, Vol. 12(3), 179-187.—EEG alpha-waves are considered to be an electrophysiological manifestation of a preventive inhibition process. This inhibition prevents reception and processing of sequences of impulses as insignificant stimuli in the cortex. During avoidance experiments a count-down was made from 20-0 with S receiving an electric shock at 0. Synchronization as compared to the resting state (strong preventive inhibition), occurred in some Ss, and desynchronization in others. Ss with strong preventive inhibition were more anxious than those with a desynchronization EEG during an avoidance experiment. A possible explanation from the aspect of learning theory and physiology is given in regard to these

unexpected results. (Czech & Russian summaries)—*English summary.*

5730. Brendsted, A. N. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Izmenenie bioelektricheskoi aktivnosti mozga detei v protsesse formirovaniya slozhnogo navyka.** [Alteration of bioelectrical activity in the child brain in the process of forming a complex habit.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 372-374.—Observed 50 3-7 yr. old Ss while engaged in a special form of play activity: (a) putting together colored geometrical parts to match a model, and (b) putting together the components of a toy according to a model. The EEG changes are detailed. Data indicate that in a particular set of EEG changes appeared in the process of play activity involving construction based on models—an effect expressed in the emergence of groups of rhythmic oscillations of relatively high amplitude with a frequency of 4-7/sec. The dynamics of this effect indicate its connection with an "orienting-investigatory reaction" on the part of the child, possibly in that complex form which L. A. Orbeli has designated as the "what-can-you-do-with-this? reflex." It is suggested that the appearance of groups of waves of slow activity in the child EEG, reflecting an aspect of the orienting-investigatory reaction, is attributable to the incomplete maturation of several mechanisms in the cortex, thalamus, and hypothalamus, involved in execution of the orienting-investigatory reflex.—*I. D. London.*

5731. Butler, R. A., Keidel, W. D., & Spreng, M. (U. Chicago) **An investigation of the human cortical evoked potential under conditions of monaural and binaural stimulation.** *Acta Oto-Laryngologica*, 1969(Oct), Vol. 68(4), 317-326.—Recorded the human cortical potential evoked by a 1000-Hz tone in 10 students and faculty members under conditions of binaural and monaural stimulation which covered a wide range of stimulus intensities. Results show that (a) the curve for the amplitude, and for the area confined by the potential, increased with increases in stimulus intensity. At higher stimulus intensities, these curves leveled off. (b) Bilateral stimulation generated larger cortical potentials than monaural stimulation. (c) Latency of the potential decreased with increases in stimulus intensity. When the monaural stimulus was delivered to the ear contralateral to the active scalp electrode, the various components the potential showed consistently a shorter latency than when the monaural stimulus was presented ipsilaterally. 5732. Chapman, Robert M., Shelburne, Samuel A., & Bragdon, Henry R. (Eye Research Foundation, Bethesda, Md.) **EEG alpha activity influenced by visual input and not by eye position.** *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 183-189.—Conducted an experiment to refute recent investigations which have suggested that elevation of the eyes is associated with a marked increase in EEG alpha activity. In preliminary and main groups of 13 and 22 Ss, an EEG electronic scorer measured the time that alpha activity was present from the left and right hemispheres in the following comparisons: (a) eye positions ahead vs. up in the light, (b) eyes ahead vs. up in the dark, and (c) eyes open vs. closed in the light. In the main group, fixation targets for the eye-ahead and eye-up positions were added. In the dark, where differential visual input was eliminated, the alpha index did not increase when eyes were elevated. Differences in alpha activity related

to eye position in the light condition were decreased when differential visual input was decreased by the use of fixation targets. The effects of variables confounded with eye position, e.g., patterned visual input to the retina, accommodation, fixation, and effort required to maintain a specified eye position, are discussed. It is concluded that the main variable that determined increase in alpha activity was reduction in visual input, either by closing the eyes or extinguishing the lights.

5733. Chizhenkova, R. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Fonovaya i vyzvannaya aktivnost' neuronov zritel'noi kory krolika posle vozdeistviya polem SVCh.* [Background- and evoked activity of neurons in the rabbit visual cortex after the action of an SHF field.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 495-501.—Studied the spontaneous and evoked activity of 63 neurons in the visual cortex of 8 unnarcotized alert rabbits after the action of a super-high-frequency (SHF) field (wavelength: 12.5 cm; 40 mw/cm²). After such action, 52.4 % of the visual cortical neurons exhibited altered spontaneous activity in the direction of increase or decrease. Neuronal responses to a light flash, as a rule, were facilitated by the action of the SHF field. Some neurons, which did not react to a light flash before the action of this field, began to respond to it after such action.—*I. D. London.*

5734. Efremova, T. M. & Trush, V. D. (Inst of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Issledovanie chastotnykh spektrov neuronnoi aktivnosti razlichnykh sloev zritel'noi kory krolika pri posloinom otvedenii vne deistviya afferentnykh razdrazhenii.* [Study of frequency spectra of neuronal activity in different layers of the rabbit visual cortex with layer-by-layer recording exclusive of the action of afferent stimulation.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 621-626.—6 unnarcotized nonimmobilized Ss were used to study the spectra of electrocorticogram (ECoG), using a microelectrode with a tip diameter of 1-5 microns, in order to determine the local spectral characteristics of the bioelectrical activity of different (5-6) layers of the cortex. The ECoG function of spectral density, $G(w)$, was computed as a Fourier transformation, utilizing the Hamming weighted function along with a correlation function. $G(w)$ provides a dependable assessment of the spectral density function of a stationary random process. EEG and ECoG power spectra, recorded from the same point of the visual cortex with an electrode having a diameter of 500 microns, were similar to each other. Spontaneous ECoG power spectra of the surface and deep layers of the visual cortex recorded with the microelectrode exhibited great similarity both in frequency composition and in relative prominence. All frequencies from 1-50 cps were represented in the spectra under study with prominence primarily in the range from 1-12 cps. The presence of wide-band spectral components is characteristic of these spectra. At the level of 900-1000 microns from the cortical surface, the ECoG power spectra differed considerably from those of the remaining levels: here a more or less equal prominence of all frequencies occurred in the range of 1-50 cps. The indicated level coincided with the inversion level of spontaneous and evoked activity.—*I. D. London.*

5735. Fruhstorfer, H., Soveri, P., & Järvillehto, T. (U. Helsinki, Inst. of Physiology, Finland) *Short-term habituation of the auditory evoked response in man.*

Electroencephalography & Clinical Neurophysiology, 1970(Feb), Vol. 28(2), 153-161.—Studied changes in the auditory evoked vertex response occurring in the course of a short train of clicks in 6 healthy male adults, to determine quantitatively the dependence of the response amplitude on the number of stimulus presentations and on the stimulus interval. S's vigilance and attention were controlled. The peak-to-peak amplitude of the individual response to the 1st stimulus of a train varied and was larger when the train was attentively expected. The amplitude distributions differed from normal in most cases. The peak-to-peak amplitude of the computed average response was smaller than the calculated mean amplitude of the corresponding single responses. With presentation of a stimulus train, all components of the average response except P_2 decreases rapidly in amplitude. With a 1-sec stimulus interval, the response had reached the asymptotic level at the 3rd stimulus. At a 3-sec stimulus interval, the decrease was less rapid and pronounced. In all cases the amplitude decrease followed approximately a negative exponential function of the number of stimulus presentations, and in part of the components, it coincided with a latency reduction. Results show that the human vertex response satisfies several main characteristics of habituation. (French summary) (20 ref.)—*Journal summary.*

5736. Genkin, A. A. & Mordvinov, E. F. (Kirov Military-Medical Academy, Leningrad, USSR) *Elektro-entsefalograficheskie korrelyaty gipnoticheskogo sostoyaniya.* [Electroencephalographic correlates of the hypnotic state.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 471-479.—8 18-21 yr. old easily hypnotizable Ss participated. A considerable decrease was established in the average level of asymmetry of duration of the phases of single EEG oscillations in the precataleptic stage of hypnosis as compared to the mean level of asymmetry in "usual alertness," defined as the state of an S sitting or lying comfortably with eyes closed. With deepening of the hypnotic state and its transition to natural sleep, the mean level of asymmetry disclosed a tendency to drop. Mean level of asymmetry in the precataleptic stage of hypnosis is shown to be a function of that for "usual alertness." A similar function was absent in the deep stages of hypnosis and natural sleep. Results (a) confirm the discrete character of the changes in mean level of asymmetry during transition from 1 functional state to another, and (b) make it possible to develop the hypothesis that there are in the CNS mechanisms which manage the regulation of the mean level of asymmetry. Mental activity in the hypnotic state produced increase in $1/2$ the cases, and, in the other $1/2$, decrease in the average level of asymmetry. Given similar activity, the direction of changes in mean level of asymmetry was the same in "usual alertness" and in hypnosis.—*I. D. London.*

5737. Guilbaud, G. (Lab. de Physiologie des Centres Nerveux, Paris, France) *Essai de classification des structures centrales au moyen des variations d'amplitude de leurs réponses évoquées somatiques au cours des cycles veille-sommeil.* [A classification of cerebral structures according to the amplitudes of their somatic evoked responses during sleep and wakefulness.] *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 340-350.—Studied the evolution of the amplitude and shape of responses evoked at various cortical and subcortical levels during different phases of sleep and wakefulness in 38 cats. Stimulating electrodes were also placed on the superficial radial

nerve and the means of groups of 25 responses were obtained. 3 groups of structures could be recognized according to the evolution of their responses during sleep: (a) primary structures (VPL, somato-motor cortex, SII cortex) in which the responses were largest during fast sleep; (b) convergent structures (centrum medianum, bulbar reticular formation, caudate nucleus, pallidum, putamen, antero-inferior portion of VL, antero-lateral and suprasylvian gyri) in which the amplitude of responses was large during slow sleep, but small during fast sleep or wakefulness; (c) mixed structures (claustrum, red nucleus, postero-superior portion of VL) showed responses with several components which behaved like one or other of the preceding types. In addition new components appeared during fast sleep. The late components of responses from mixed structures were abolished by ablation of the somato-motor cortex but were unaffected by cerebellectomy. The occurrence of late components in the responses of mixed structures during fast sleep was attributed to an increase in the excitatory influence which the somato-motor cortex normally exerts on subcortical structures. Reinforcement of an inhibitory influence of somato-motor cortical origin is also believed to occur during fast sleep. (45 ref.)—*English summary.*

5738. Hartley, L. R. (Medical Research Council, Cambridge, England) **The effect of stimulus relevance on the cortical evoked potentials.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 531-546.—Investigated the relationship between selective attention and the cortical evoked potentials and avoided some methodological artifacts. 12 21-65 yr. old Ss were divided into auditory and visual signal detection groups. Each group was required to detect infrequent signals of 1 modality in a random sequence of auditory and visual stimuli. Results provide no direct support for the postulated correlation between the 2 variables, but do suggest 2 possible explanations. (37 ref.)—*Journal abstract.*

London, England) **EEG measures of arousal during RFT performance in "noise."** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 594.—Measured EEG alpha of 21 undergraduates during upright Rod and Frame Test (RFT) performance in 6 blocks of 4 trials in a portable apparatus. Neither the stability of RFT performance nor the amount of EEG alpha was found to be affected by loud earphone noise delivered whenever alpha exceeded 80% of S's maximum alpha. Results are discussed in relation to P. K. Oltman's proposal that RFT performance may be influenced by physiological arousal.—*Author abstract.*

5740. Jewett, D. L. (U. California, Medical Center, San Francisco) **An average response technique for recording potentials relative to a distant point without EKG interference.** *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 414-416.—Describes a technique used to evaluate the electrical activity of an electrode implanted in the caudate nucleus in 4 adult cats. The recording sweep and the onset of the stimulus were triggered from the EKG after a variable delay so that the average was obtained in a relatively flat portion of the EKG cycle. (French summary)—*Journal summary.*

5741. Jovanović, U. J. (Universitäts-Nervenklinik, Würzburg, W. Germany) **Die subklinische Schlafaktivität im EEG.** [Subclinical sleep activity in the EEG.] *Psychiatria Clinica*, 1969, Vol. 2(6), 338-

367.—Defines "subclinical sleep activity" (SSA) in the EEG as the appearance of sleep-associated features appearing in the waking EEG without clinical concomitants of sleep, and which disappear on hyperventilation, sensory stimulation, waking-drugs, and sleep. Following the usual procedure for sleep recordings the SSA can also be divided into States A and B. State A contains the substate Aa in which the SSA is not yet recognizable; the substate Ab shows continuous and regular alpha waves without changes in frequency or amplitude; the substate Ac shows flat EEG rhythms. The subclinical sleep activity in State B can be subdivided into substate Ba with smaller and faster theta waves, and the substate Bb with medium-frequent theta waves of 4-5 cps. In the substate Bc clinical sleep appears. 82 persons with SSA were found in a total of 1059 Ss. All Ss were investigated by resting EEG, hyperventilation, sensory stimulation, and waking-drugs. 14 cases were also observed during several nights while polygraphic recordings were made during natural sleep. (3 p. ref.)—*Journal summary.*

5742. Karlin, Lawrence; Martz, Merrill J., & Mordkoff, Arnold M. (New York U.) **Motor performance and sensory-evoked potentials.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 307-313.—determined the averaged evoked potentials (EPs) to tones for 15 undergraduates in 3 tasks designed to evaluate the effects of motor response, of withholding a response, and of different response latencies. With the influence of eye movement minimized, various deflections of the sensory EPs were affected differently as follows: (a) withholding a response produced a significantly larger P₁ deflection, the amplitude of which was negatively correlated with RT; (b) stimuli, to which overt motor responses were later made, produced a negative shift in deflections N₁, P₂, and N₂, but there were no significant changes in deflections P₁, P₃ and N₃; and (c) no effects could be ascribed to specific time characteristics of the tasks (simple vs. choice RT), to the overt motor response, or to its immediately preceding EMG activity. Data are interpreted to mean that the negative shift in N₁, P₂, and N₂ is related to the development of an excitatory state associated with intention to respond to stimulus, and that increased positivity in P₃ is uniquely related to withholding a response when rapid action is required. No effects on the averaged EP could be unequivocally attributed to occurrence of overt motor response itself. (French summary) (19 ref.)—*Journal summary.*

5744. Kotelenko, L. M. & Matyushkin, D. P. (Leningrad State U., USSR) **Svoistva neironov slukhovoí kory letucheí myshi (reaktsii na ul'trazvuki raznoi vysoty i intensivnosti).** [Properties of neurons in the bat auditory cortex (reactions to ultrasound of various

frequencies and intensities.) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 502-508.—Ss were 11 narcotized bats (*Myotis oxygnathus*). Cortical evoked potentials displayed the character of primary responses. The responses of cortical neurons to ultrasound had the form of single or multiple high-amplitudinal action potentials with a latent period of 5-43 msec. The majority of the neurons, reacting to ultrasound, were located at a depth of 500-800 microns. With growth of stimulus intensity of ultrasound, evoked potentials and neuronal reactions increased to a certain limit, beyond which in most cases a weakening occurred. Excitatory and inhibitory thresholds of the cortical neurons were variable. Part of the neurons reacted to only a certain (sometimes very narrow) band of ultrasonic intensities. An investigation of thresholds of neuronal reactions as a function of frequency of ultrasonic signals disclosed that frequency-threshold curves were comparatively restricted for part of the nerve cells, whereas for others these curves covered the whole or almost the whole range of applied ultrasound (10-100 kcps). However, with repeated determinations, extended frequency-threshold curves were uncovered in all the neurons under study. The extension of the frequency-threshold curves of previously narrow-ranged neurons is hypothetically connected with the lengthy action of a schedule of threshold stimulations.—*I. D. London.*

5745. Kudinov, M. P. & Myslobodskii, M. S. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Nekotorye osobennosti reaktsii mozga cheloveka na parnyi svetovoi stimul.* [Some features of human cerebral reaction to paired photic stimulus.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 293-300.—Employed 29 18-35 yr. old Ss in light sleep and when awake to study the amplitude and latent period of several components of evoked potential to a paired photic stimulus. Considerable individual differences were detected in the dynamics of restoration for the components of the mean evoked potential. In the wakeful state, exaltation occurred when the interval between stimuli was of the order of 100 msec. The 2nd period of exaltation for the different components of the mean evoked potential occurred at different times—from 200-500 msec. The dynamics of restoration for the components is a function of the part of the slow negative wave of the preceding response, in which they develop. In wakeful Ss the restoration curves for the latent periods of the components repeated the course of the restoration curves for their amplitude. The magnitude of the latent period of the alpha afterdischarge, in response to the 2nd stimulus when the intervals between stimuli are from 70-300 msec., always exceeded the initial magnitude. It is concluded that during sleep the correspondence between the amplitude of the component of the mean evoked potential and the time, preceding its maximum, is destroyed.—*I. D. London.*

5748. Larsson, Lars E. & Prevec, Tine S. (Regional Hosp., Linköping, Sweden) *Somato-sensory response to mechanical stimulation as recorded in the human EEG.* *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 162-172.—Tapping various sites of the body evoked well defined responses in the EEG from the somatosensory scalp area in 37 human Ss. These responses were similar to those evoked by peripheral nerve stimulation in the same S, but had longer latencies for characteristic peaks, and lacked the initial negative wave characteristic of the latter responses. Summated nerve action potentials evoked by peripheral nerve stimulation were single synchronous volleys of comparatively large amplitude, while those evoked by tapping had a small amplitude and tended to be polyphasic. Responses evoked by tapping were widespread, but tended to have maximal amplitudes in accordance with the known somatotopic organization. Responses to taps on the proximal parts of the extremities and on the trunk and face had large amplitudes and wide distributions. Latencies of the initial parts of the response were shorter when evoked by proximal than distal taps. Later waves did not behave so regularly; they may in individual cases have had longer latencies for proximal than for distal taps. Distribution and latency studies suggest the existence of a dual complementary inflow responsible for the evoked potential, at least when evoked from proximal parts of the extremities and trunk. (French summary) (28 ref.)—*Journal summary.*

5749. Luk'yanova, O. N. *Izmenenie spetsificheskoi afferentatsii vo vremya osushchestvleniya orientirovochnogo refleksa.* [Changes in specific afferentation during execution of the orienting reflex.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 165-176.—It was shown that, during the orienting reflex, it is possible to observe the facilitation or inhibition of "afferent information" as a function of strength of the new stimulus. Dogs were Ss. Changes in excitability of the auditory pathway were recorded during the orienting reflex, with evoked potentials and the EEGs of the auditory cortex serving as indices of excitability.—*I. D. London.*

5750. Martin, James I. (U. Arizona) *Effects of binocular fusion and binocular rivalry on cortically evoked potentials.* *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 190-201.—Employed 2 stimulus patterns to obtain pattern-characteristic responses to monocular stimulation in an experiment with 5 adult Ss. Various combinations of the stimuli in monocular and binocular presentation, together with S's perceptual judgment of dominance in conditions of rivalry, yielded 12 experimental conditions. Correlations and t-statistics were computed for the evoked potentials obtained under several combinations of experimental conditions. Results indicate that the physiological record obtained under conditions of binocular stimulation is not composed of equal contributions from each monocular source. There was no apparent definite relation between the pattern which was perceived under conditions of rivalry and the resulting wave form of the evoked potential. The utilization of

cortically evoked potentials as a physiological indicator of subjective phenomena under conditions of binocular rivalry does not appear to be substantiated. A form of electrophysiological dominance appears to exist which seems to be unrelated to either momentary or general perceptual dominance, but may be related to an interaction of the eye-of-origin with the physical characteristics of the stimulus. (French summary)—*Journal summary*.

5751. Miller, Josef M., Moody, David B., & Stebbins, William C. (U. Washington, Medical School) **Evoked potentials and auditory reaction time in monkeys.** *Science*, 1969(Feb), Vol. 163(3867), 592-594.—Trained 2 monkeys with bipolar stimulating and recording electrodes in primary auditory cortex to release a key to the onset of a pure tone. Substitution of direct cortical stimulation for the pure tone resulted in a reduction of 15 msec. in the latency of the behavioral response. This changed latency agreed with the latency of the primary evoked potential recorded from Ss. Systematic related changes in the amplitude of the central response and in the latency of the behavioral response followed changes in the intensity and frequency of the acoustic stimulus.—*Journal abstract*.

5752. Naumova, T. S. & Popova, N. S. (Inst. of the Brain, Moscow, USSR) **Analogi vyzvannykh potentsialov i ikh otnosheniye k mezhsignal'nym reaktsiyam pri formirovani oboronitel'nogo uslovnogo refleksa.** [Analog of evoked potentials and their relation to intersignal reactions in the formation of the defensive conditioned reflex.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 410-418.—Studied the dynamics of electric potentials in the system of the signal (auditory and visual) analyzer in establishment of the defensive CR, in order to carry out a "deeper analysis" of the processes taking place in intersignal reactions. Ss were 6 dogs with electrodes implanted in the territory of the cortical termini of the auditory (Field T₁), visual (Field O₁), and dermomotor (Field PrC₁) analyzers, and also in the internal and lateral geniculate bodies. CRs were elaborated to intermittent (2/sec) auditory stimulation (clicks); afterwards to photic stimulation (flashes of light). Reinforcement was single threshold electrostimulation of the forepaw, after 5 flashes or clicks. In the system of the auditory and visual analyzers (primary projection cortical zones and geniculate bodies), analogs of evoked potentials were recorded against a background of intersignal reactions (observed in the 2nd and 3rd stages of formation of the defensive CRs). To the degree that the CR was established, the amplitude and duration of these analogs displayed the same dynamics as the primary responses to CR stimulation, but the dynamics of the former outstripped that of the latter. In the reflex-stabilization stage, the analogs of evoked potentials in the system of the signal analyzer ceased to be recorded, but they became more distinct in the cortical terminus of the dermomotor analyzer. In this way, in the elaboration of the defensive CR, intersignal reactions occurred as a result of increase in the level of trace excitation in the signal constellation, developing in advance of any stage in the formation of the reflex. It is suggested that intersignal reactions constitute a distinctive, self-adjusting mechanism, "training the reflex being formed and 'gambling on' the results of future events."—I. D. London.

5753. Posthumus Meyjes, F. E. (U. Amsterdam, Netherlands) **Some characteristics of the early components of the somato-sensory evoked response to**

mechanical stimuli in man. *Psychiatria, Neurologia, Neurochirurgia*, 1969(May), Vol. 72(3), 263-268.—Studied the average somato-sensory evoked response to electrical stimulation and to mechanical stimulation with both the blunt and sharp end of a neurological pin in 19 normal 18-27 yr. old volunteers, with emphasis on the early components of the response. A significant difference in latency was disclosed which has not yet been described in the literature; the mean latency was 21.1 msec. after electrical stimulation of the index- or middle-finger, 23.1 msec. after stimulation with the blunt and 24.5 msec. after stimulation with the sharp end of the pin. These differences were valid for the beginning and for the peak of the 1st negative wave of the response in the contralateral primary sensory area. The reproducibility of the early components of the responses was good.—*Journal summary*.

5754. Rosenfeld, Joel P., Rudell, Alan P., & Fox, Stephen S. (U. Iowa) **Operant control of neural events in humans.** *Science*, 1969(Aug), Vol. 165(3895), 821-823.—Describes an experiment designed to specify brain wave components as potential information carriers as demonstrated by their ability to yield to operant control. Human Ss were trained by traditional methods of instrumental conditioning to change the amplitude of a late component of the auditory evoked potential with and without oscilloscopic feedback of their performance.—*Journal abstract*.

5755. Suvorov, N. B., Neimark, G. S., Vasilevskii, N. N., & Soroko, S. I. (Inst. of Experimental Medicine, Leningrad, USSR) **Analiz impul'snoi aktivnosti neirona i usrednenie vyzvannykh potentsialov pri pomoshchi amplitudnykh analizatorov.** [Analysis of neuronal impulse activity and averaging of evoked potentials by means of amplitude analyzers.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 730-733.—Presents the theory and design of a semiconductor transformer, permitting the utilization of certain types of amplitude analyzers for the construction of post-stimulation histograms, and the averaging of evoked potentials and EEG segments. The transformer preserves unchanged the temporal relationships of the impulse process, with amplitude of the impulses a linear function of time. Some advantages of the transformer over others: (a) high linearity of transformation of time into amplitude for any interval of time, (b) a maximal stimulatory frequency of 1000 cps, and (c) use with amplitude analyzers, having any number of channels.—I. D. London.

5756. Varga, M. E., Kuznetsova, G. D., Myslobodskii, M. S., & Slobodchikova, O. N. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **O sposobe vyrobki klassicheskogo oboronitel'nogo (umyvatel'nogo) uslovnogo refleksa u krysa.** [On a method of elaborating a classical defensive (washing) conditioned reflex in rats.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 719-722.—12 white rats were Ss in this study detailing a new method of elaborating a classical electrodefensive CR to light flashes on the basis of the washing UCR, accompanied by registration of EEG changes during the elaboration. Advantages of the method: (a) it permits the study of classical defensive CRs in freely moving rats, while strictly grading the strength of stimulation; and (b) the absence in the EEG of noticeable artifacts of stimulation, in bringing about CRs and UCRs, promotes the proper analysis of electrical responses in the cortex during the elaborational process.—I. D. London.

5757. Vasil'ev, B. D., Levenko, B. A., & Il'ichev, V. D. (State U., Moscow, USSR) **Vysvannye potentsialy akusticheskikh yader i osobennosti slukha u travyanoi lyagushki.** [Evoked potentials of the acoustic nuclei and the features typifying hearing in the grass frog.] *Fiziologicheskii Zhurnal SSSR*, 1969(Dec), Vol. 55(12), 1457-1464.—40 prepared frogs (*Rana temporaria*) were used in a study to assess the possibilities of acoustic perception in amphibians via: (a) "seismic" means, i.e., a system involving the anterior extremities, opercular muscle, and operculum; (b) the dermo-vascular system; and (c) the system of the middle ear; including a determination of the major functional characteristics of the central parts of the auditory analyzer in the frog. Described are the basic parameters of the evoked potentials, recorded in response to sound (click, tone) in the region of the acoustic nuclei of the medulla oblongata (dorsal cochlear nucleus, olivary nucleus). Maxima for frequency-sensitivity of evoked potentials of the medulla oblongata were located in the range of .4-1.4 kcps. Variability of frequency curves was observed along with their dependence on signal intensity. Ablation of the columella and ear drum changed the character of the frequency curve, with amplitude of responses to tones and clicks diminishing at the same time. It is suggested that columellar transmission of sound in the frog is not the only channel for the conduction of sound. The restoration cycle, following the action of paired clicks, covered 30 msec. on the average for medullary potentials. Increase in duration of the front of the tonal signal from 0-3 msec. led to a sharp decline in the amplitude of medullary responses. With further increase in fronts, the amplitude of response changed little. A dependence on signal frequency is disclosed. (English summary) (24 ref.)—*I. D. London.*

5758. Vozova, T. M. (Pavlov Inst. of Experimental Medicine, Leningrad, USSR) **K voprosu o strukturnoi organizatsii polovogo refleksa.** [On the structural organization of the sexual reflex.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 545-547.—2 3-yr-old male dogs, with electrodes implanted in the hippocampus, amygdala, preoptic region, pyriform lobe, and caudate nucleus, were used to study the bioelectrical activity of a number of cerebral structures during sexual excitation through light massage of column glandis penis, producing erection and lordosis. It is shown that, in the presence of excitation by mechanical stimulation of the penis, changes with respect to spontaneous EEG were observed in the picture of the concurrent EEG in the amygdala, hippocampus, and preoptic region. Such stimulation, however, did not change the character of the EEG in the caudate nucleus and pyriform lobe. After 12 applications of such stimulation (duration of 30 sec. with intervals of 2 min. and more), an electrophysiologically CR connection of the functional state of the S with the experimental set-up appeared. This connection was maintained for 18 sessions without the application of the stimulation. The pyriform lobe and caudate nucleus appeared to be recruited into the functional organization maintaining this state.—*I. D. London.*

SENSORY PHYSIOLOGY

5759. Batkin, S., Groth, H., Watson, J. R., & Ansberry, M. (Kaiser Medical Center, Honolulu, Hawaii) **Effects of auditory deprivation on the development**

of auditory sensitivity in albino rats. *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 351-359.—Confined 20 albino Manor Farm rats for 8 mo. postnatally to a highly sound-attenuated environment and tested them subsequently for hearing sensitivity. Comparisons were made with 20 control littermates, reared under ordinary ambient noise conditions. Surface auditory evoked cortical potentials were summated for 45 or 75 responses at each of 7 pure tone frequencies. Threshold determinations were made between 30-75 db., SPL. Several Ss were retested after subsequent 48-hr and 3-wk ambient noise exposure. Statistical comparisons of threshold responses between deprived Ss and controls show a significant loss of sensitivity after deprivation and some regain of sensitivity after subsequent exposure to ambient noise. Relationships between environmental stimulation and neural functioning are considered. (French summary) (39 ref.)—*Journal summary.*

5762. Etholm, B. (U. Oslo, Inst. of Neurophysiology, Norway) **Evoked responses in the inferior colliculus, medial geniculate body and auditory cortex by single and double clicks in cats: A preliminary report.** *Acta Oto-Laryngologica*, 1969(Feb), Vol. 67(2-3), 319-325.—Evaluated the inhibitory process at various stations of the auditory system and attempted to determine whether any inhibitory mechanisms in the medial geniculate (MG) body could determine the narrow frequency capable of driving MG cells. It was demonstrated that the auditory system has a high fidelity of the signal transmission. Using double clicks, inhibitory processes were found in cats lasting up to 150 msec. and more in the medial geniculate body and the auditory cortex. In the inferior colliculus, inhibition lasted approximately 50 msec. (French & German summaries)—*Journal abstract.*

5763. Florek, Hieronym. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Frequency of spontaneous palpebral**

reaction in a visual task. *Studia Psychologica*, 1970(Vol. 12(2)), 103-111.—The frequency of spontaneous palpebral reaction has sometimes been used to judge the degree of visual fatigue. Various methods are employed for assessing this reaction. The present study was designed to test this reaction in a visual task by means of an original method. Results imply that while this reaction is higher in a visual task than is generally assumed, it tends to decline during the task and is negatively correlated to the performance itself and its quality. (Czech & Russian summaries)—*Journal abstract*.

5764. Fokin, V. F. & Fomin, B. A. (Inst. of the Brain, Moscow, USSR) *Fonovaya i vyzvannaya ritmicheskim svetovym razdrazheniem aktivnost' ganglioznykh kletok setchatki kozhki*. [Spontaneous activity and that evoked by rhythmic photic stimulation of the ganglionic cells of the cat retina.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 661-670.—In 18 nembutalized cats, recordings were made of 115 ganglionic neurons of the retina. The following were investigated: impulse activity of the ganglionic cells on exposure of the "unopened eye" to darkness, constant background illumination, and rhythmic stimulation by short light flashes. The mean discharge frequency of ganglionic cells (number of impulses/sec) in the case of darkness and of constant background illumination was linearly correlated with that evoked by flashing light. With a frequency of 1 flash/sec, $r = .78$ for dark and .95 for light adaptation. High correlation was maintained also with large frequencies of photic stimulation. With increase in the frequency of light flashes, the mean discharge frequency of the ganglionic cells increased, while the number of incoming impulses at each light flash was connected with frequency of stimulation, a function close to the exponential. The types of ganglionic cellular responses to a light flash (differentiated with respect to their impulse pattern) and their behavior due to rhythmic photic stimulation are described. The evoked activity of a group of closely located ganglionic cells exhibited in most cases the same pattern of response as that of a single ganglionic cell, drawn from this group.—*J. D. London*.

(National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **Induction of brain D(—)- β -hydroxybutyrate dehydrogenase activity by fasting.** *Science*, 1969(Jan), Vol. 163(3862), 79-81.—Presents results from an experiment with adult male Sprague-Dawley rats which demonstrate that although D(—)- β -hydroxybutyrate dehydrogenase activity is very low in normal adult rat brain, it increases during fasting in parallel with the ketosis. It is concluded that the increase may represent part of a mechanism by which the brain adapts to changing patterns of substrate supply during starvation.—*Journal abstract*.

5773. Bhagavan, H. N., Coursin, D. B., & Stewart, C. N. (St. Joseph Hosp., Research Inst., Lancaster, Pa.) **Glycemic response to shock stress in biotin deficiency.** *Life Sciences*, 1969(Oct), Vol. 8(20, Pt. 2), 1117-1124.—Weanling male Sprague-Dawley rats were maintained on a biotin-deficient diet and submitted to 2 conditions: (a) Ss in the fed state were shocked, and (b) 24-hr fasted Ss were shocked. Both received 1.5 ma, rms, scrambled for 5 min. and then immediately sacrificed and blood glucose assayed by the glucose oxidase method. Shock stress increased blood glucose levels in both biotin-deficient and controls in the fed state. The response of the deficient Ss to shock stress can be attributed to their ability to mobilize glucose reserves in addition to the utilization of the available dietary glucose. Ss in the fasted state showed that while the controls showed a hyperglycemic response to shock stress, the deficient Ss showed severe hypoglycemia. Biotin pretreatment of the deficient Ss failed to show hypoglycemia to shock stress. Blood glucose level is maintained by gluconeogenesis which is impaired in biotin deficiency and therefore the fasted animal has no glycogen reserves and the hypoglycemia was observed. The control fasted Ss which had no glycogen reserves and displayed hyperglycemia under stress must have had a stimulation of their gluconeogenesis. Although the effect of shock stress on the glycemic states in biotin-deficient Ss is primarily due to an impairment in gluconeogenesis alterations in adrenal-hypophyseal function may also occur. (18 ref.)—W. E. Wood.

5774. Cardon, P. V. & Guggenheim F. G. (National Inst. of Mental Health, Chevy Chase, Md.) **Effects of large variations in diet on free catecholamines and their metabolites in urine.** *Journal of Psychiatric Research*, 1970(Jul), Vol. 7(4), 263-273.—When results are expressed in relation to urinary creatinine, the most liberal diet (excessive in catecholamine and caffeine content) increased normetanephrine and 3-methoxy-4-hydroxymandelic acid excretion by about 30%. Free epinephrine and metanephrine excretion rates also increased by 40 and 10%, respectively, but the changes were not statistically significant. The more liberal diets tended to increase intra-S variance. (19 ref.)—R. V. Hamilton.

(Western Washington State Coll.) **Water metabolism with prolonged ethanol consumption in the rat.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 675-677.—Maintained 18 Holtzman male albino rats on an alternate day presentation schedule in which 1 of 3 alcohol concentrations

was substituted for water. An apparently adequate fluid balance was attained for 6 and 12%, but not for 24% alcohol.—*Journal abstract*.

5777. Fomicheva, E. E. (Inst. of Experimental Medicine, Leningrad, USSR) **Osobennosti vzaimodeistviya odnostonnnykh otritsatel'nykh uslovykh refleksov s polozhitel'nyimi (po pokazatelyam kolichestva i kachestva slyunnogo sekreta).** [Features of interaction between unilateral negative conditioned reflexes and positive conditioned reflexes (according to quantitative and qualitative indices of salivary secretion).] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 698-700.—4 dogs with exteriorization of symmetrical parts of the tongue were used to study the interaction between unilateral negative CRs and positive CRs, both unilateral (elaborated with unconditioned stimulation of parts of the tongue) and general alimentary (elaborated with unconditioned stimulation of the oral cavity). The data procured on the unilateral change in chemical composition of the salivary secretion (according to the quantitative index of general salivary protein) in response to positive stimuli under the influence of negative stimuli add to the conception of the structurofunctional organization of unilateral CRs within the bounds of 1 cerebral hemisphere.—I. D. London.

5778. Jalowiec, John E. & Stricker, Edward M. (McMaster U., Hamilton, Ontario, Canada) **Sodium appetite in rats after apparent recovery from acute sodium deficiency.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 238-244.—Induced acute sodium deficiency in adult male albino Sprague-Dawley rats by subcutaneous formalin injection. Ss allowed access to drinking water for 24 hr. remained hyponatremic (due to renal retention of ingested water) but apparently recovered from hypovolemia, whereas water-deprived Ss evidenced little hyponatremia or hypovolemia. Urinary potassium/sodium ratios indicate high levels of circulating aldosterone in both groups, and all Ss drank increased amounts of saline when water and .51 M NaCl solution were made available subsequently. Moreover, Ss with previous access to water drank much more saline than did Ss that had been water deprived. Results suggest that high endogenous levels of aldosterone may elicit sodium appetite in rats despite apparent recovery from acute sodium deficiency, and that hyponatremia may potentiate this effect. (25 ref.)—*Journal abstract*.

5779. Mark, J., Heiner, L., Mandel, P., & Godin, Y. (Centre National de la Recherche Scientifique, Centre de Neurochimie, Strasbourg, France) **Norepinephrine turnover in brain and stress reactions in rats during paradoxical sleep deprivation.** *Life Sciences*, 1969(Oct), Vol. 8(19, Pt. 1), 1085-1093.—Observed an increased catabolism of exogenous norepinephrine in the brains of male Wistar rats subjected either to total sleep deprivation or to close confinement without abolition of paradoxical sleep. This suggests that the observed metabolic change was not a consequence of paradoxical sleep deprivation and it seems possible that stress reactions were occurring. This hypothesis was tested by examining adrenal gland weights and plasma corticosterone levels. (20 ref.)—*Journal abstract*.

5781. Sanseigne, Alain. (Squibb International, New

York, N.Y.) **Chemistry and pharmacology of fluphenazine decanoate.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 10-11.—Identifies problems concerning the responses of humans and various animal species to the new long-acting and potent phenothiazines (i.e., fluphenazine). These problems include development of a dose response curve and prediction of single patient response to the drug. Differences in response patterns of various animals to high dosages make correlations with human response difficult. The 2 pharmacological tests which appear promising measure the antiemetic activity of the drug in dogs and the inhibition of conditioned response in rats.—*P. McMillan*.

5782. Tsuchiya, K., Toru, M., & Kobayashi, T. (Tokyo Medical & Dental U., Japan) **Sleep deprivation: Changes of monoamines and acetylcholine in rat brain.** *Life Sciences*, 1969(Aug), Vol. 8(15, Pt. 1), 867-873.—Total sleep deprivation in adult male Wistar rats produced by maintenance on a 24-hr avoidance schedule produced slightly increased acetylcholine in the telencephalon and markedly decreased 5-hydroxytryptamine and norepinephrine in the diencephalon. After a short period of sleep following the 24-hr sleep deprivation, the decreased 5-hydroxytryptamine and norepinephrine levels rapidly equaled or surpassed the control levels. When the paradoxical sleep was deprived for 96 hr., the acetylcholine content decreased in the telencephalon and the norepinephrine level was significantly lowered in the brainstem. There was, however, no significant change in the level of 5-hydroxytryptamine after 96 hr. of paradoxical sleep deprivation. (18 ref.)—*Journal abstract*.

5783. van Praag, H. M., Korf, J., van Woudenberg, F., & Kluys, T. P. (State U., Central Isotope Lab., Groningen, Netherlands) **An attempt at indirect evaluation of the noradrenaline hypothesis.** *Psychiatry, Neurologia, Neurochirurgia*, 1969(Mar), Vol. 72(2), 181-189.—Postulated that, within the context of the noradrenaline (NA) hypothesis, DL-p-chloro-N-methylamphetamine (CMA) has an antidepressant action. Both the prediction and the assumption that, at the molecular level, the action of CMA is similar in both humans and test animals are supported. Findings also support the NA hypothesis concerning the mechanism of action of antidepressants. It is concluded that the NA hypothesis is important because it relates chemical data to phenomena of behavior and can be tested, thus lending fresh impetus to psychopharmacological research. (16 ref.)—*Journal abstract*.

Hormones

5784. Beatty, William W. & Beatty, Patricia A. (North Dakota State U.) **Hormonal determinants of sex differences in avoidance behavior and reactivity to electric shock in the rat.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 446-455.—Compared the acquisition of avoidance behavior by male and female Holtzman rats (N = 80, 22, 40, 30, and 78) in a 2-way shuttle box. The performance of both sexes was an inverted U-shaped function of UCS intensity and males performed more poorly at each of

the 4 shock levels tested. At higher UCS intensities male performance was characterized by a marked intersession response decrement, a pattern rarely seen in female performance. Control experiments demonstrated that the sex difference was not related to differences in body weight, age, or reproductive experience. Females also had lower flinch and jump thresholds in tests of sensitivity to electric shock. Gonadectomy in adulthood did not modify the avoidance behavior or sensitivity to shock of either sex, but testosterone injections in infancy, when combined with testosterone replacement in adulthood, produced females whose avoidance behavior was dramatically masculinized.—*Journal abstract*.

5785. Borodin, A. D. (Medical Inst., Donetsk, USSR) **Vliyaniye eksperimental'nogo tireotoksikoza na razvitiye kompensatornoi gipertrofi nadpocheknikov.** [Influence of experimental thyrotoxicosis on development of compensatory adrenal hypertrophy.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 27-30.—Studied 240 unilaterally adrenalectomized white rats, with and without thyrotoxicosis induced by the feeding of thyroidin, to evaluate a condition serving as an experimental model of prolonged stress placed upon the hypothalamo-hypophyseal-adrenal system. It is shown that an alteration occurs in the dynamics of (a) the corticotropin creating activity of hypothalamic extracts, and (b) hypophyseal level of the ACTH at different periods after the adrenalectomy. It is suggested that the excessive cumulation of thyroid hormones influences the hypothalamic regulation of the hypophyseal-adrenal system.—*I. D. London*.

5786. Sassin, J. F., et al. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Effects of slow wave sleep deprivation on human growth hormone release in sleep: Preliminary study.** *Life Sciences*, 1969(Dec), Vol. 8(23, Pt. 1), 1299-1307.—5 20-26 yr. old male volunteers were used to test the effect of slow wave sleep (SWS) deprivation on release of human growth hormone (HGH). Ss fasted and an indwelling venous catheter was positioned in an antecubital vein and electrodes for EEG (C₃-A₂, monopolar lead) were attached. Blood was sampled every 20-30 min. and free HGH was separated out. Deprivation involved foot shock when 2 slow waves of less than 2 Hz. and greater than 75µV. appeared. SWS deprivation resulted in diminution of HGH secretion in 3 of the 5 Ss, absence of secretion in 2 of these, and delay in secretion in all Ss. Technical difficulties in achieving complete SWS deprivation may account for failure to demonstrate more consistent inhibition of HGH release. Results show that although HGH secretion occurred in NREM sleep there was not a simple cause-effect relationship between the EEG criteria of SWS and HGH secretion.—*W. E. Wood*.

5787. Weiss, Jay M., et al. (Rockefeller U.) **Pituitary-adrenal influences on fear responding.** *Science*, 1969(Jan), Vol. 163(3863), 197-199.—Found that in a passive avoidance situation, hypophysectomized male albino rats show less fear than normal Ss, whereas adrenalectomized Ss show greater fear than normals. It is suggested that results occurred because hypophysectomized Ss lack ACTH, which increases arousal or emotionality, whereas adrenalectomized Ss lack certain adrenal steroids, which inhibit excitatory effects. Results indicate that ACTH, and certain adrenal steroids have opposite effects in regulating fear-motivated behavior. (18 ref.)—*Journal abstract*.

Drug Effects-Human

5788. Carroll, Douglas; Lewis, Stuart A., & Oswald, Ian. (U. Edinburgh, Scotland) **Effect of barbiturates on dream content.** *Nature*, 1969(Aug), Vol. 223(5208), 865-866.—Vividness of dream content as reflected in tape-recorded utterances during awakening periods was assessed using the Foulkes 8-point scale. Evaluations were made under control conditions, following administration of a placebo, and following barbiturate administration in 4 young healthy male Ss. Results led to the conclusion that "barbiturates alter the dream experience, making it more conceptual and less perceptual, more 'thought-like' and less 'dream-like.'"—B. A. Stanton.

5789. Eisdorfer, Carl; Nowlin, John, & Wilkie, Frances. (Duke U., Medical School, Center for the Study of Aging & Human Development) **Improvement of learning in the aged by modification of autonomic nervous system activity.** *Science*, 1970(Dec), Vol. 170(3964), 1327-1329.—Reports that partial blockade of beta-adrenergic end-organ response to the autonomic nervous system was effected in 13 60-78 yr. old male volunteers by administration of propranolol. 15 Ss were given a placebo. Improved performance in a learning task by the drug group was noted. Data support the hypothesis that the learning decrement found among older men is not simply a manifestation of structural change in the CNS but is, at least in part, associated with the heightened arousal of the autonomic nervous system that accompanies the learning task. (17 ref.)—*Journal abstract*.

5790. Hollister, Leo E., Moore, Frances; Kanter, Saul, & Noble, Ernest. (Veterans Administration Hosp., Palo Alto, Calif.) **Δ^1 -tetrahydrocannabinol, synhexyl and marijuana extract administered orally in man: Catecholamine excretion, plasma cortisol levels and platelet serotonin content.** *Psychopharmacologia*, 1970, Vol. 17(4), 354-360.—A transient rise in epinephrine excretion occurred following oral doses of 1- Δ -trans-tetrahydrocannabinol which is best explained by the anticipatory stress of the experiment or the rapid onset of unfamiliar symptoms. A decreased turnover of catecholamines was suggested by the decrease in vanilmandelic acid excretion following synhexyl. Plasma cortisol was unchanged except in the presence of psychological stress. Platelet serotonin was unchanged. The lack of major effects of marijuana-like drugs on stress measurements corroborates the clinical observation. The euphoriant and sedative effect of marijuana may ameliorate the stress of psychotomimetic experience.—*Journal abstract*.

5791. Kamenkovich, V. M. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Vliyaniye fenatina na porogi tsvetorazlicheniya cheloveka.** [Influence of phenatine on human color discrimination thresholds.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 716-718.—6 Ss participated in a study of the influence of 20-mg phenatine on the thresholds of color (orange-red) discrimination. (Phenatine is a product of the condensation of phenamine and nicotinic acid, belonging to the class of sympathomimetic amines and stimulants of the CNS.) Results show that the effect of phenatine on color discrimination was highly variable with respect to both magnitude and sign. In some Ss it brought on a considerable deterioration of the capacity.—I. D. London.

5792. Lesis, S. A., et al. (Royal Edinburgh Hosp.,

Scotland) **Heroin and human sleep.** *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 374-381.—Investigated the suggestion that drugs of addiction cause suppression of REM sleep followed by immediate withdrawal rebound. 4 normal male volunteers had a subcutaneous injection of 7.5 mg. heroin on 3 successive nights. During this period REM sleep was decreased with respect to base-line values and showed a trend back to control values over the 3 nights. On withdrawal there was a moderate but immediate percentage of REM sleep increase which, over the 1st 3 hr. of sleep, was significant. 2 Ss received 7 more injections of 7.5 mg. heroin 2 mo. later. Again REM sleep was reduced. 1 S had increased REM sleep immediately on withdrawal. Evidence of withdrawal was apparent for 2 mo. after stopping heroin. The other S showed little evidence of withdrawal effects in sleep. His proportion of REM sleep was never significantly above base-line values, indicating considerable individual differences in the effects of withdrawal of heroin. It is concluded that, far from giving an undisturbed sleep, heroin administration results in an increased frequency of shifts to Stage 1 sleep (drowsiness) or wakefulness and an increased delay to the onset of the 1st Stage 2 of the night. (French summary) (24 ref.)—*Journal summary*.

5793. Lewis, Evan G., Dustman, Robert E., & Beck, Edward C. (Veterans Administration Hosp., Salt Lake City, U.) **The effects of alcohol on visual and somato-sensory evoked responses.** *Electroencephalography & Clinical Neurophysiology*, 1970(Feb), Vol. 28(2), 202-205.—9 moderate drinkers imbibed various amounts of alcohol or a placebo, after which visual and somatosensory evoked responses were recorded. The 95% alcohol doses were .41 gm. and 1.23 gm/kg of body weight, the equivalent of 1 and 3 oz. of alcohol, respectively, for a 160-lb man. After ingestion of 3 oz. of alcohol, the amplitude of late waves of visual and somatosensory evoked responses recorded from central areas was attenuated significantly. Evoked responses recorded from the occipital area showed no such changes. With some Ss, a hemispheric asymmetry of amplitude, generally noted with recordings from central areas, disappeared after alcohol ingestion. (French summary) (16 ref.)—*Journal summary*.

Drug Effects-Animal

5794. Amit, Zalman & Baum, Morrie. (McGill U., Montreal, Quebec, Canada) **Comment on the increased resistance-to-extinction of an avoidance response induced by certain drugs.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 310.—Suggests that the effect is not dependent on the pharmacological properties of any specific drug or mode of administration but is a function of the induced drug state, which is aversive to the pharmacologically naive S and thus acts to increase fear in the avoidance situation.—M. West.

5795. Arnfred, T. & Randrup, A. **Cholinergic mechanism in brain inhibiting amphetamine induced stereotyped behaviour.** *Acta Pharmacologica et Toxicologica*, 1968(Aug), Vol. 26(4), 384-394.

5796. Beaton, J. M. & Crow, T. J. (U. Aberdeen, Scotland) **The effect of noradrenaline synthesis inhibition on motor activity and lever pressing for food and water in the rat.** *Life Sciences*, 1969(Oct), Vol. 8(19, Pt.1), 1129-1134.—In an investigation into the effects of α -methyl-paratyrosine on lever pressing for

food and water, and voluntary activity in 2 male black hooded rats, it was found that the drug could inhibit lever pressing for food at doses of 25 mg/kg upwards. However, marked tolerance appeared to this effect. Lever pressing for water and wheel running activity were much less consistently affected at all dose levels. The duration of action of the effect on food intake of an initial dose of 100 mg/kg corresponded approximately to the duration of tyrosine hydroxylase inhibition brought about by this drug.—*Journal summary.*

5797. Biederman, G. B. (U. Toronto, Ontario, Canada) **Forgetting of an operant response: Physostigmine-produced increases in escape latency in rats as a function of time of injection.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 384-388.—Found the latency of a fixed ratio (FR) 3 escape response in 218 male Wistar rats to be a U-shaped function of the interval between training and injection of the anticholinesterase drug physostigmine, for 30 min.-5 day intervals between training and injection. An increase in FR 3 escape latency was found at 28 days. FR 1 escape groups produced a latency curve of a shape similar to that of the FR 3 group. Data confirm the results of earlier experiments using a different training procedure, and a different response measure. Results are consistent with the theory that the physiological correlate of rat memory lies in synaptic change.—*Journal abstract.*

5798. Carlini, E. A. & Masur, Jandira. **Development of aggressive behavior in rats by chronic administration of cannabis sativa (marihuana).** *Life Sciences*, 1969(Jun), Vol. 8(11, Pt. 1), 607-620.—Examined the relationships between aggressive behavior, starvation, age, weight, and dosage of marihuana in pairs of 1-6 mo. old male and female Wistar rats. In addition to ip injections of crude extracts of marihuana, electric shock was used to induce fighting behavior. Results show that: (a) both methods elicited striking aggressive behavior in starved rats, although in the shock-induced method it was detected somewhat earlier; (b) aggressiveness appeared equally in 2-6 mo. old Ss, unresponsive of sex; (c) amount of fat tissue appeared to have some effect but more experimentation is urged in this area; and (d) elevation and diminution of temperature had, respectively, effects to decrease and increase aggressiveness. Previous experiments are cited to show that the aggressiveness elicited in starved rats has not been obtained by chronic administration of other drugs, e.g., caffeine, amphetamine, and amobarbital sodium.—*G. Steele.*

5799. Conner, Robert L., Stolk, Jon M., Barchas, Jack D., & Levine, Seymour. (Stanford U., Medical School) **Parachlorophenylalanine and habituation to repetitive auditory startle stimuli in rats.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1215-1219.—Studied the relationship between brain serotonin levels and habituation of a skeletal-motor startle response using parachlorophenylalanine (PCPA), a drug which inhibits the formation of serotonin. Ss were 64 Long-Evans male rats. Depletion of brain serotonin by PCPA slows down, but does not prevent, habituation. PCPA given to Ss that were habituated before starting drug treatment causes a transitory increase in startle response magnitude. Whether PCPA is administered before or after habituation, the treated Ss exhibit heightened reactivity to startle stimuli following exposure to novel stimuli. Results suggest that brain serotonin plays a role in inhibitory processes.—*Journal abstract.*

5800. Conner, Robert L., et al. (Stanford U., Medical School) **The effect of parachlorophenylalanine (PCPA) on shock-induced fighting behavior in rats.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1221-1224.—Studied shock-induced fighting behavior in 64 Long-Evans male rats treated with parachlorophenylalanine (PCPA). In the doses used, PCPA injections depleted brain serotonin to 10% of the control levels. In the 1st study, injections were started prior to initial behavioral testing. In Exp. II injections were started during a sequence of repeated behavioral testings in the shock-induced fighting situation. In neither case was there any evidence that PCPA injections had any effect on shock-induced fighting behavior in rats.—*Journal abstract.*

5801. Dewsbury, Donald A. & Davis, Harry N. (U. Florida) **Effects of reserpine on the copulatory behavior of male rats.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1331-1333.

5802. Genovese, E., Napoli, P. A., & Bolego-Zonta, N. (U. Milan, Italy) **Selfaggressiveness: A new type of behavioral change induced by pemoline.** *Life Sciences*, 1969(May), Vol. 8(9, Pt. 1), 513-515.—Examined self-aggressiveness after the administration of pemoline in isolated Swiss albino mice and Sprague-Dawley rats. Ss exhibited hypermotility 1 hr. after administration of the drug and self-aggressiveness after 6-8 hr. Sex and dosage effects were found. It is concluded that "pemoline elicits the described effect through the formation of an active metabolite."—*G. Steele.*

5803. Gilinskiĭ, M. A. & Ilyuchēnok, R. Yu. (Inst. of Physiology, Novosibirsk, USSR) **Kholinergicheskie mekhanizmy retikulyarnogo tormozheniya neironov kory golovnogo mozga koshki.** [Cholinergic mechanisms of reticular inhibition of the cortical neurons in the cat.] *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1969, Vol. 19(4), 653-660.—For study of the reaction of cortical neurons (619 in all; Ss were 61 immobilized cats) high-frequency stimulation was applied to the contralateral hind leg and the intercollicular section of the mesencephalic reticular formation. M-cholinolytic agents were employed: amizyl, benzacine, and atropine as well as the anticholinesterase compound, galanthamine, and agents which exert, respectively, excitatory and blocking action on the central adenosensitive structures: pyridol and aminazine (chlorpromazine). Also investigated was the effect of the beta-adrenoblocker 1-(4-nitrophenyl)-2-isopropylaminoethanol. Rhythmic activity of a portion of the neurons of the 1st somatosensory cortex was inhibited on direct or sensory excitation of the ascending reticular activating system. Inhibition of the discharges was closely connected with the appearance of cortical EEG activation. Administration of cholinolytic agents into the vein and the carotid artery and their application on the cortex blocked reticular inhibition of the neurons, while simultaneously abolishing EEG activation. The data provide evidence that reticular inhibition in the cortex is brought about through a system of synapses with muscarinosensitive cholinergic transmission. Thus, the cholinergic nature of reticular inhibition of the spontaneous activity of the cortical neurons is demonstrated. The existence of a possible mechanism is postulated for the EEG reaction of desynchronization, in which an important role is assigned to neurons which undergo inhibition on direct or on sensory stimulation of the ascending activating system.—*I. D. London.*

5804. Goldberg, Stephen R., Woods, James H., &

Schuster, Charles R. (U. Michigan, Medical School) **Morphine: Conditioned increases in self-administration in rhesus monkeys.** *Science*, 1969(Dec), Vol. 166(3910), 1306-1307. —Maintained operant responding in 3 monkeys by iv presentations of morphine. Nalorphine produced reliable increases in morphine-reinforced responding. With successive daily nalorphine injections there was a decreased latency of self-administration responding for morphine, and substituted saline injections produced conditioned increases in morphine-reinforced responding. —*Journal abstract.*

5805. Goroyan, G. P. & Kalyuzhnyi, L. V. (Inst. of Medicobiological Problems, Moscow, USSR) **Vliyaniye skopolamina i aminazina na reaktsiyu sam-orazdrzheniya i izbeganiya u krolikov.** [Influence of scopolamine and aminazine on the reaction of self-stimulation and avoidance in rabbits.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 543-544. —7 Ss, with electrodes implanted in the anterior and posterior regions of the hypothalamus, were used to study the changes in the "reactions of self-stimulation and self-avoidance," procured on stimulation of the hypothalamic structures after im administration of the cholinolytic, scopolamine (.1-2 mg/kg), and the adrenolytic, aminazine (chlorpromazine; 1-2 mg/kg), 20-25 min. before experimentation. The data show that, on stimulation of the hypothalamic region, aminazine produced inhibition of the avoidance reaction, while scopolamine had practically no effect or even facilitated it somewhat. It is suggested that the avoidance reaction, connected with the functioning of the hypothalamic structures, has an adrenergic mechanism. The reaction of self-stimulation was suppressed by both aminazine and, to a much greater degree, by scopolamine. These data provide the basis for thinking that scopolamine is more connected with the cholinergic substratum of the hypothalamus. The action of aminazine on the reaction of self-stimulation is explained by alluding to both the possibility of the inclusion of adrenergic mechanisms and also the presence of cholinolytic properties in the pharmacological agent. —*I. D. London.*

5806. Haddad, R. K., et al. (New Jersey Neuropsychiatric Inst., Princeton) **Intellectual deficit associated with transplacentally induced microcephaly in the rat.** *Science*, 1969(Jan), Vol. 163(3862), 88-90. —6 Fischer rats injected with methylazoxymethanol late in pregnancy produced young with considerably reduced cerebral hemispheres. As adults these Ss (N = 12) made more errors in the Hebb-Williams maze than did controls. —*Journal abstract.*

5807. If'yuchënok, R. Yu. & Zinevich, V. S. (Inst. of Physiology, Novosibirsk, USSR) **Kholinergicheskie mekhanizmy retikulo-korkovogo vyzvannogo potentsiala.** [Cholinergic mechanisms of reticulocortical evoked potential.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 480-487. —Used the M-cholinolytic agents, atropine and amizyl (benactyzine), and the anticholinesterase agent, galanthamine, on 75 immobilized unnarcotized cats. Stimulation of the middle and medial parts of tectum mesencephali by single impulses brought about the emergence in the cortex of potentials that have short latencies and exhibit different configurations. In the frontal areas of the cortex a biphasic positive-negative reticulocortical response was recorded; in the parietal areas a monophasic negative response. This points to the presence of a monosynaptic ascending system from the mesencephalic reticular formation to the

cerebral cortex. Iv administration of amizyl and atropine depressed the amplitude of the reticulocortical responses (in most cases to the point of their complete disappearance) and increased the amplitude of the primary response to stimulation of peripheral nerves. At the same time application of these agents inhibited only the negative phase of the reticulocortical responses, while increasing the negative phase of the primary response. The antagonism between M-anticholinergic and anticholinesterase agents occurred only in relation to reticulocortical responses. This confirms the presence of a muscarinergic cortical link in the ascending reticular activating system. —*I. D. London.*

5808. Jouvet, Michel. (School of Medicine, Lyons, France) **Biogenic amines and the states of sleep.** *Science*, 1969(Jan), Vol. 163(3862), 32-41. —Reviews recent findings which lead to the hypothesis that cerebral serotonin has a role in the process of sleep. In 1 series of experiments, inhibition of the synthesis of serotonin at the level of tryptophan hydroxylase by p-chlorophenylalanine led to total insomnia which was reversible; return to normal sleep was effected by injection of 5-hydroxytryptophan, the immediate precursor of serotonin. In a 2nd series, total destruction of serotonin-containing neurons located in the raphe system also led to total insomnia. A 3-way correlation existed between the extent of destruction of the raphe, the decrease in cerebral serotonin, and the resulting insomnia. It is concluded that paradoxical sleep depends upon priming serotonergic mechanisms located in the caudal raphe system and upon triggering mechanisms located in the nuclei of the locus coeruleus. Destruction of these nuclei leads to the suppression of paradoxical sleep without alteration of slow-wave sleep. The successive intervention of serotonergic, cholinergic, and noradrenergic mechanisms in the triggering and effecting of paradoxical sleep is implied by neuropharmacological results. (68 ref.) —*Journal summary.*

5809. Kadzielawa, K. & Widy-Tyszkiewicz, E. (Academy of Medicine, Warsaw, Poland) **Electroencephalographic analysis of the central action of dihydroxyphenylalanine.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 259-265. —Analyzed the EEG effects of β -(3,4-dihydroxyphenyl)-alanine (DOPA) in 35 male cats, depending upon the level of brainstem section, and in 6 cats and 6 rabbits with chronically implanted electrodes. In contrast with cats with chronically implanted electrodes, gallamine-immobilized, and with encéphale isolé cats, in which DOPA is unable to induce profound changes in the EEG pattern and behavior, this amino acid elicits an intense desynchronization in Ss with brainstems sectioned at the postpontine, rostrompontine, and collicular levels. The desynchronization is not found in hippocampus and amygdala. In the early period of action, DOPA induces desynchronization mainly ipsilaterally to hemisection at the rostrompontine level. The observed effects of DOPA are not very dependent on its autonomic effects. In contrast with the mild pressor response in gallamine-immobilized cats and in preparations with the brainstem sectioned at higher levels, there is an intense increase in blood pressure and heart rate in encéphale isolé preparations. It is concluded that DOPA-induced desynchronization is probably inhibited in Ss with intact neuraxes by the tonic ascending influences of the synchronizing bulbar and higher spinal structures. (French summary) (24 ref.) —*Journal summary.*

5810. Kadzielawa, K. & Widy-Tyszkiewicz, E. (Academy of Medicine, Warsaw, Poland) **The influence of various pharmacological agents on the desynchronization produced by DOPA in the cerebeau isolé preparation.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 266-272.—The desynchronizing effect of μ -(3,4-dihydroxyphenyl)-alanine (DOPA) was prevented in 45 cats following inhibition of the aromatic acid decarboxylase and antagonized or partly reduced by disulfiram pretreatment. Phenox-ybenzamine, but not phentolamine, antagonizes the DOPA action, while propranolol delays the onset of desynchronization and decreases its intensity. Imipramine and chlorpromazine reverse the action of DOPA. The effect of this amino acid is not apparently modified in reserpinized Ss. In cerebeau isolé preparations, x-methyl-DOPA, in contrast to DOPA, causes a high voltage fast rhythm. Phentolamine in low doses activates the EEG in cerebeau isolé preparations. It is concluded that DOPA-induced desynchronization in cerebeau isolé preparations the S is mediated probably through dopamine and noradrenaline action and is not very dependent upon autonomic effects. (French summary) (21 ref.).—*Journal summary*.

5811. Karkishchenko, N. N. **Izmeneniye vnutrisistemnykh otnosheniy golovnogo mozga v usloviyakh farmakologicheskogo vozdeistviya.** [Changes in cerebral intrasystemic relations under pharmacological action.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 139-147.—Presents data on the profound changes that take place in the intrasystemic relations of the brain under the action of aminazine (chlorpromazine), whose neurodynamics cannot be reduced to its local influence on the reticular formation, hypothalamus, limbic structures, etc.—I. D. London.

5812. Khruleva, L. N. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Vliyaniye indopana na vysshuyu nervnyuyu deyatel'nost' sobak.** [Influence of indopan on higher nervous activity in dogs.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 389-394.—Used 5 Ss with different types of nervous systems to determine the influence of different doses of alpha-methyltryptamine hydrochloride (indopan) on higher nervous activity. It is shown that indopan is a stimulator of the CNS, possessing a triphasic action: (a) in small doses (.1-.25 mg/kg) it inhibits CRs, (b) in moderate doses (.5 mg/kg) it produces a pronounced stimulating action, (c) in large doses (1-1.5 mg/kg and higher) it inhibits CRs. The action of indopan is also a function of the typological features of the S's nervous system, and the initial functional state of the CNS. (English summary) (21 ref.).—I. D. London.

5813. Klimenko, E. M. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Provedeniye nervnykh impul'sov v voloknakh bol'shogo chrevnogo nerva, indushchikh k mozgovomu veshchestvu nadpochechnika u koshek.** [Conduction of nerve impulses in fibers of the superior splanchnic nerve leading to the adrenal medulla in cats.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 7-10.—Studied the synaptic interruption of adrenal-bound superior splanchnic nerve fibers in the semilunar ganglionic cells of the solar plexus of nembutalized Ss. Analysis of evoked bioelectrical activity in the common trunk of the superior splanchnic nerve and in the branches leading to the adrenals revealed that

the action potentials in the latter differ from those of the former by (a) the presence of certain components in their composition, (b) the duration of the potentials and the latent period for their emergence, and (c) the frequency characteristics of the impulses being conducted. The iv administered cholinolytic, hexonium (2-5 mg/kg), led to a general reduction of the amplitude of the action potentials in the adrenal-bound branches, and a complete suppression in some. Data provide evidence for the presence of a synaptic interruption in a portion of the adrenal-bound fibers in the semilunar ganglion of the solar plexus.—I. D. London.

5814. Lawrence, Carl W. & Haynes, Jack R. (Travis State School, Austin, Tex.) **Epinephrine and norepinephrine effects on social dominance behavior.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 195-198.—Investigated the effects of epinephrine and norepinephrine on social dominance behavior in 24 male C57BL/6J mice. The social dominance hierarchy was created by placing pairs of Ss in a linear maze. The only way S could get to the goal box was by pushing the opposing S out. After the dominance hierarchy was established, each S was placed in the dominance situation under each of the 2 drug conditions. Results show that all conditions were significantly different from each other, with the greatest amount of dominance behavior being shown under norepinephrine and the greatest submissive behavior under epinephrine. It is concluded that epinephrine and norepinephrine may have differential effects on social dominance behavior.—*Journal abstract*.

5815. Leonard, B. E. & Tonge, Sally R. (U. Nottingham, England) **Effects of some hallucinogenic drugs upon the metabolism of noradrenaline.** *Life Sciences*, 1969(Aug), Vol. 8(15, Pt. 1), 815-825.—Investigated the actions of phencyclidine, ditran, LSD-25, and mescaline on the catecholamines of the brains of Wistar rats. Decreased levels of noradrenaline (NA), accompanied by slightly elevated dopamine (DA) levels, were observed with all 4 drugs. Phencyclidine increased the degree of depletion of NA produced by reserpine. All 4 drugs increase the depletion of NA and DA by alpha-methyl-m-tyrosine, but had no effect upon the depletion produced by alpha-methyl-p-tyrosine. Normetanephrine levels either were unaffected or were slightly decreased, indicating that the fall in NA is not a consequence of an increased release from neurons. It is suggested that part of the mechanism of action of hallucinogenic drugs is to inhibit the release of NA from the neuron, thus allowing its catabolism by MAO. (15 ref.).—*Journal summary*.

5816. Lepore, Franco; Ducharme, Raymond, & Cardu, Bruno. (U. Montreal, Quebec, Canada) **Memory and ribonucleic acid (RNA): Transfer of an avoidance response.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 99-103.—Used 4 groups of 7 male albino Sprague-Dawley rats each to test the hypothesis that learning can be transferred by means of RNA. The experimental group was injected with RNA obtained from the brains of Ss conditioned to an avoidance response. The control group received no RNA. A 2nd control group was given RNA which came from the brains of nonconditioned Ss. The 4th group received RNA extracted from the muscles of conditioned Ss. Results did not confirm the transfer hypothesis since no RNA facilitating effect on subsequent avoidance training was observed. (18 ref.).—*Journal abstract*.

5817. Lovett, D. & Booth, D. A. (U. Sussex, Lab. of

Experimental Psychology, Brighton, England) **Four effects of exogenous insulin on food intake.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 406-419.—After a subcutaneous injection of bovine insulin into female Lister hooded rats, at 1st there was an augmentation of the satiety produced by nutrient eaten immediately before injection. Later, with large enough doses, feeding was elicited—perhaps by hastening the passage of satiety. A 3rd type of effect is behavioral disruption, reducing food and water intake when food is withheld for an hr. after injection and producing postural changes even when food is present. 4th, repeated pairing of insulin injection with intake of water of a particular flavor depresses subsequent intake of water having that flavor, whether presented alone or together with water of another flavor which has been paired with control injections. The acquired discriminated intake change involves the initial acceptability of the flavor but changes in the inhibition of acceptability during an intake bout have not been excluded. (26 ref.)—*Journal abstract.*

5818. **Matin, M. A.** (Industrial Toxicology Research Center, Lucknow, India) **Correlation between electroencephalographic (EEG) effects and acetylcholine content of brain after cholinolytic hallucinogens.** *Japanese Journal of Pharmacology*, 1969(Dec), Vol. 19(4), 515-519.—Examined the effect of atropine, hyoscyne and total alkaloids of *Datura alba* on the EEG and total acetylcholine content of the whole brain of rats. A decrease was noted in the frequency of cps in different areas of the brain with total alkaloids of *Datura alba* causing the maximum reduction of cps followed by hyoscyne and atropine. An attempt was made to correlate the EEG changes with the acetylcholine content of the brain at a given time. Total alkaloids of *Datura alba* caused a maximum reduction of the total acetylcholine content of the brain along with a reduction in the frequency of cps 30 min. after administration. Hyoscyne was less potent in reducing the acetylcholine content of brain and in reducing the cps, while atropine was least potent in both respects, 30 min. after administration of both drugs. (20 ref.)—*Journal summary.*

5819. **Mekhedova, A. Ya.** (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Farmakologicheskaya regulatsiya formirovaniya veroyatnostnogo stereotipa u sobak (effekty atsefena).** [Pharmacological regulation of formation of a probability stereotype in dogs (acephane effects).] *Zhurnal Vysheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 366-368.—Used 3 dogs to study the facilitating properties of acephane (lucidril, centrophinoxin) on the formation of a probability stereotype. The method of salivary CRs with both constant and 1:1 probability reinforcement was utilized. Maximal conditioned reactions appeared before the administration of acephane, when the level of secretion was the same for both small (5 gm. of meat) and probability reinforcement. Adequate "averaged" reactions were formed with the use of acephane, if probability-reinforcement was accompanied earlier by the development of emotional tension. The positive regulatory influence of acephane appears to be a function of the stage of formation of adaptive reactions to probability reinforcement, observed before the use of the preparation.—*I. D. London.*

5820. **Miller, F. P. & Maickel, R. P.** (Indiana U., Lab. of Psychopharmacology) **The role of brain amines in the behavioral depression produced by a benzo-**

quinolizine. *Life Sciences*, 1969(May), Vol. 8(9, Pt. 1), 487-491.—The mechanism by which p-chlorophenylalanine (PCPA) and benzoquinolizine, Ro 4-1284, produce a state of behavioral depression was examined in adult male Sprague-Dawley rats from which continuous avoidance measurements were made, both pre- and postdrug administration. Both drugs were given ip in a volume of .1 ml/100 gm body weight. The levels of brain serotonin (5 HT) and norepinephrine (NE) were lowered at 1 day after the drug PCPA but by 8 days the NE level was normal while 5 HT was still lowered, with 5HT returning to normal at 15 days. The effect of Ro 4-1284 was usually to produce a depression of continuous avoidance responding. The avoidance rate was not affected by PCPA administration, however, PCPA pretreatment had an effect on the Ro 4-1284 action, but only at the 8-day level. Present results lend support to the importance of the relative ratios of free 5 HT and NE in producing a depressed effect. Behavioral perturbations may be produced by manipulations of either free 5 HT or NE.—*W. E. Wood.*

5821. **Mirzoyan, S. A. & Paglavyan, V. G.** (Medical Inst., Erevan, USSR) **Vliyanie iprazida na mozgovoe krovoobrashchenie i kislorodnoe napryazhenie v mozgovoĭ tkani.** [Influence of iprazid on cerebral circulation and oxygen tension in cerebral tissues.] *Ek'sperimental'nyĭ i Klinikaniĭ Bzhshkoviĭyanĭ Handes*, 1969, Vol. 9(6), 3-9.—62 cats, 15 rabbits, and 3 dogs were used to study the influence of the psychotropic agent, iprazid (an MAO), on cerebral circulation and O₂ tension in cerebral tissues. Under conditions of resistography, iprazid weakened cerebrovascular tonus—an effect which was more strongly expressed in intracarotid rather than iv administration. The administration of iprazid was accompanied by an increase in volume-velocity of blood flow in the cerebral surface and in the carotid artery. Increase in blood supply was more expressed in chronic experiments in the absence of a general anesthesia. Iprazid increased O₂ tension in cerebral tissues.—*I. D. London.*

5822. **Norris, Dale M., Ferkovich, Stephen M., Rozental, Jack M., & Baker, James E.** (U. Wisconsin) **Energy transduction: Inhibition of cockroach feeding by naphthoquinone.** *Science*, 1970(Nov), Vol. 170(3959), 754-755.—Reports that 1,4-naphthoquinones inhibit feeding of the cockroach (*Periplaneta americana*) by (a) complexing with sulfhydryl groups of receptor protein in sensory neurons, (b) oxidizing the sulfhydryl groups, and (c) being reduced.—*Journal abstract.*

5823. **Oliverio, Alberto.** (U. Sassari, Italy) **Effects of nicotine and strychnine on transfer of avoidance learning in the mouse.** *Life Sciences*, 1968(Nov), Vol. 7(22, Pt. 2), 1163-1167.—Showed transfer of avoidance learning to occur when mice previously trained to respond to a given stimulus were subjected to a session in which a new stimulus was used. The magnitude of the transfer phenomenon was dependent on the length of a training session during which Ss were given an experience of a compound CS formed by the already known and by the new stimulus together. Posttrial administration of nicotine and strychnine enhanced transfer of learning.—*Journal summary.*

5824. **Rabin, A. G. & Glantz, V. L.** (Inst. of Normal & Pathological Physiology, Moscow, USSR) **Deĭstvie nembutala na afferentnyy peredachu v talamicheskom somatosenzornom rele.** [Action of nembutal on afferent transmission in the thalamic somatosensory relay.]

Zhurnal Vyssheĭ Nervnoi Deyatel'nosti, 1969, Vol. 19(4), 644-652.—26 immobilized cats were given increasing doses of nembutal (5-60 mg/kg). Recordings were made of the spontaneous activity and evoked potentials of the thalamic posterioventral nucleus along with the discharges of single neurons there. After the administration of 5-20 mg/kg of nembutal, barbiturate spindles were formed in the EEG, the level of spontaneous neuronal activity dropped, and group discharges, arising chiefly in the negative waves of slow EEG oscillations, appeared. Parallel to this, there occurred (a) a drop in amplitude of the postsynaptic negative phase of evoked potential, and (b) the formation of a slow positive wave and that of slow secondary cyclic oscillations, accompanied by repeated bursts of afterdischarges of the thalamic neurons. In doses higher than 30 mg/kg, evoked cyclic oscillations became less regular and the series of afterdischarges was suppressed. With increase in administered nembutal, the restoration cycle of excitability of the thalamic neurons became progressively longer.—*I. D. London*.

5825. Reid, W. D., Stefano, F. J., Kurzepa, S., & Brodie, B. B. (National Heart Inst., Lab. of Chemical Pharmacology, Bethesda, Md.) **Tricyclic antidepressants: Evidence for an intraneuronal site of action.** *Science*, 1969(Apr), Vol. 164(3878), 437-439.—In an experiment with male Sprague-Dawley rats, it was found that desipramine, a tricyclic antidepressant drug, almost completely prevents the accumulation of tritiated norepinephrine by sympathetic neurons of the heart after the injection of a tracer dose of the labeled amine. However, desipramine does not alter the accumulation of norepinephrine after the injection of a large dose of the neurohormone. Despite the failure of desipramine to block the neuronal uptake of norepinephrine, it still prevents exogenous norepinephrine from displacing the endogenous neurohormone from intraneuronal storage sites. (22 ref.)—*Journal abstract*.

5826. Robichaud, R. C. & Sledge, K. L. (Warner-Lambert Research Inst., Morris Plains, N.J.) **The effects of p-chlorophenylalanine on experimentally induced conflict in the rat.** *Life Sciences*, 1969(Sep), Vol. 8(17, Pt. 1), 965-969.—To examine the role of serotonin in the brain and in mental illness 6 male Long-Evans rats were administered p-chlorophenylalanine (p-CPA), after each S was trained to a lever for liquid reward on a variable-interval (VI) 2-min schedule. A tone stimulus was activated at 15-min intervals to signal available food paired with foot shock. p-CPA had little effect during VI 2-min periods but responses increased during tone periods. Findings may be due to a change in drive level after p-CPA or p-CPA may increase sensitivity to pain. Effects on conflict behavior with p-CPA similar to those found with other anti-anxiety agents but p-CPA was more prolonged.—*W. E. Wood*.

5827. Sanghvi, I. & Gershon, S. (New York U., Medical School, Neuropsychopharmacology Research Unit) **The evaluation of central nervous system stimulants in a new laboratory test for antidepressants.** *Life Sciences*, 1969(May), Vol. 8(9, Pt. 1), 449-457.—Investigated "the effect of pretreatment with amphetamine, cocaine, and a new compound, 1-(2-dimethylaminoethyl)-1-phenylindine hydrochloride (MJ-1986)" in mongrel dogs. D-amphetamine sulphate (1 mg/kg) and cocaine hydrochloride (1.5 mg/kg) were administered 30 min. before the yohimbine test. Results indicate that blood pressure, alertness, and excitement

increased in Ss treated with amphetamine and cocaine. MJ-1986 had only a transient CNS stimulation effect. It is concluded that "the validity and specificity of the yohimbine test for the evaluation of clinically useful antidepressant agents has been further substantiated" and that "nonspecific CNS stimulants can be differentiated from clinically effective antidepressants." (21 ref.)—*G. Steele*.

5828. Saxena, V. C., Bapat, S. K., & Dhawan, B. N. (M.L.N. Medical Coll., Allahabad, India). **An experimental evaluation of the anticonvulsant activity of some antihistaminic drugs.** *Japanese Journal of Pharmacology*, 1969(Dec), Vol. 19(4), 477-484.—Screened 21 antihistaminic agents for anticonvulsant activity in albino rats using the supramaximal electroshock seizure pattern (SMES) and metrazol seizure threshold (MST) tests. The drugs were administered orally by a stomach cannula to groups of 10 Ss each. All the drugs were inactive in the MST test but 16 drugs were active in the SMES test. Their neurotoxicity was determined and protective indices (PI) calculated. Data indicate that, in descending order, triprolidine, buclizine, meclozine, promethazine, and cyproheptadine have a higher PI than diphenylhydantoin or phenobarbitone. The structural requirements for anticonvulsant activity in antihistaminic drugs are discussed.—*Journal summary*.

5829. Sinha, J. N., Dhasmana, K. M., Dixit, K. S., & Bhargava, K. P. (K. G.'s, Medical Coll. Lucknow, India) **Antagonism of imipramine induced fatal hyperpyrexia in MAO inhibitor treated rabbits.** *Japanese Journal of Pharmacology*, 1969(Dec), Vol. 19(4), 623-625.—Investigated side effects produced by catecholamines by studying "the effect of specific α and β -adrenergic blockers on the fatal hyperpyrexia induced by MAO inhibitor-imipramine combination." Ss were 35 adult albino rabbits. Experimental Ss were pretreated with niamid and subsequently given imipramine at 1 of 2 dosage levels (2.5 or 5 mg/kg iv). Controls received either niamid or imipramine with saline. Results indicate that controls did not exhibit fatal hyperpyrexia. Experimental Ss showed hyperpyrexia, with fatal hyperpyrexia appearing in those who received niamid and the higher dosage of imipramine.—*P. McMillan*.

5830. Stevens, David A., Fechter, Laurence D., & Resnick, Oscar. (Clark U.) **The effects of p-chlorophenylalanine, a depletor of brain serotonin, on behavior: II. Retardation of passive avoidance learning.** *Life Sciences*, 1969(Apr), Vol. 8(8, Pt. 2), 379-385.—Tested male Charles River rats for passive avoidance learning following injection of p-chlorophenylalanine (p-CIPhe) in steroid suspending vehicle, of the vehicle only. In Exp. I, 42 Ss were trained for 20 trials before testing; in Exp. II, 20 Ss were trained to a criterion before testing. In both experiments, Ss given p-CIPhe learned more slowly than controls. This supported the hypothesis that p-CIPhe, a specific depletor of brain serotonin, reduces emotionality rather than increases learning ability.—*Journal summary*.

5831. Tonge, Sally R. & Leonard, B. E. (U. Nottingham, England) **The effects of some hallucinogenic drugs upon the metabolism of 5-hydroxy-tryptamine in the brain.** *Life Sciences*, 1969(Aug), Vol. 8(15, Pt. 1), 805-814.—Investigated the effects of the 4 hallucinogenic drugs (phencyclidine, ditran, LSD-25, and mescaline) on the metabolism of 5-hydroxytryptamine (5-HT) in the brains of Wistar rats. All 4 drugs caused increases in the levels of 5-HT, accompanied in the early

stages by decreases in the levels of 5-hydroxyindolyl-acetic acid, suggesting that the relationship between the 2 substances which exists in untreated animals had been altered. No effect on either MAO or aromatic amino acid decarboxylase activity was detected. The depletion of 5-HT which follows the administration of either reserpine or p-chlorophenylalanine was significantly reduced by all 4 drugs. Results support the theory that LSD owes its hallucinogenic activity to an ability to alter the capacity of the tissues to bind 5-HT. Further, the demonstration that 4 hallucinogens of widely different structure all affect the binding of 5-HT supports the implication of this action in hallucinogenesis.—*Journal summary*.

5832. Wise, C. David & Stein, Larry. (Wyeth Lab., Philadelphia, Pa.) **Facilitation of brain self-stimulation by central administration of norepinephrine.** *Science*, 1969(Jan), Vol. 163(3864), 299-301.—29 rats, with electrodes implanted in the medial forebrain bundle, stimulated their own brains at sharply reduced rates after systemic administration of disulfiram or intraventricular administration of diethyldithiocarbamate. Both drugs inhibit dopamine- β -hydroxylase, the enzyme responsible for the final step in the biosynthesis of norepinephrine. The suppressed behavior was reinstated by intraventricular injections of 1-norepinephrine, but not by injection of its biologically inactive isomer, d-norepinephrine. Intraventricular administration of dopamine and serotonin did not restore self-stimulation. The rewarding effect of medial forebrain bundle stimulation may depend on the availability of norepinephrine as a transmitter, but not on dopamine or serotonin. (15 ref.)—*Journal abstract*.

5833. Zakhariya, E. A. & Zapadnyuk, V. I. (Inst. for Advanced Medical Training, Kiev, USSR) **Vliyaniye nikotina na vozniknoveniye audiogennykh sudorog u zhivotnykh razlichnogo vozrasta.** [The influence of nicotine on the emergence of audiogenic seizures in animals of different ages.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 24-25.—Used 380 rats, 658 mice, and 40 guinea pigs in an ontogenetic study of the influence of ip administered nicotine (3.5, 10 mg/kg) on the frequency of emergence of audiogenic seizures and their severity. In rats and mice nicotine increased the readiness of the convulsive response, leading to an intensification and increase of audiogenic seizures. The degree of the convulsive response was most pronounced in young and old rats and mice. Audiogenic seizures could not be induced in guinea pigs either spontaneously or after the administration of nicotine.—*I. D. London*.

5834. Zitlin, Arthur; Beach, Frank A., Barchas, Jack D., & Dement, William C. (New York U., Medical School) **Sexual behavior of male cats after administration of parachlorophenylalanine.** *Science*, 1970(Nov), Vol. 170(3960), 868-870.—Observed the behavior of 12 male cats before and after 6 or 8 daily injections of parachlorophenylalanine. Sexual performance was either unchanged or diminished; aggressive behavior was not seen. Serotonin concentrations in the brains were uniformly lowered. (17 ref.)—*Journal abstract*.

CARDIOVASCULAR PROCESSES

5835. Blizard, David & Welty, Roberta. (Jackson Lab., Bar Harbor, Me.) **A technique for monitoring the**

heart rate of mice. *Psychophysiology*, 1970(Jul), Vol. 7(1), 143-144.

5836. De Vietti, Terry L. & Porter, Paul B. (Central Washington State Coll.) **Heart-rate response during aversive conditioning.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 651-658.—Used 36 male Wistar rats to determine the effects of (a) footshock before specific training, (b) CS duration (6 vs. 60 sec.), and (c) form of aversive conditioning (CER vs. conditioned avoidance response) on heart rate during the presentation of the CS and between presentations. All 3 tested variables were effective in modifying the heart-rate response to the CS while only CS duration altered heart rates between CS presentations.—*Journal abstract*.

5837. Engel, Bernard T. & Gottlieb, Sheldon H. (Baltimore City Hosp., Gerontology Research Center, Md.) **Differential operant conditioning of heart rate in the restrained monkey.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 217-225.—Trained each of 3 rhesus monkeys to slow and to speed its heart rate to avoid electric shock. All Ss learned. Each Ss' performance was highly reliable from session to session. Blood pressures did not significantly differ between the slowing and speeding contingencies. Heart rates and blood pressures were significantly highly positively correlated during heart-rate slowing but were uncorrelated during heart-rate speeding indicating that the physiological mechanisms of slowing and speeding were different. The animal preparation described is chronic, highly reliable, and physiologically accessible for a wide variety of measurements. It should be quite valuable in studies of operant cardiac control and in studies of physiological mechanisms associated with cardiac changes in the intact primate.—*Journal abstract*.

D. London*.

5840. Moibenko, A. A. (Bogomolets Inst. of Physiology, Kiev, USSR) **Reflektornye izmeneniya regionalnogo sosudistogo soprotivleniya pri ishemii izolirovannogo ot krovoobrashcheniya serdtsa.** [Reflex changes in regional vascular resistance in the presence of ischemia of the heart isolated from circulation.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 26-27.—Studied 16 dogs with myocardial ischemia to determine the possible role of the aortal chemoreceptors in reflex vasomotor reactions due to myocardial hypoxia. Reflex vascular constriction was noted in the extremities, small intestine, and kidney. It is shown that reflex vasoconstriction is not connected with stimulation of the aortal chemoreceptor structures. Further hypoxic excitation of the aortal chemoreceptors altered the magnitude and regional structure of the pressor reaction.—*I. D. London*.

5841. Obrist, Paul A., Webb, Roger A., Sutterer, James R., & Howard, James L. (U. North Carolina) **Cardiac deceleration and reaction time: An evaluation of two hypotheses.** *Psychophysiology*, 1970(May), Vol. 6(6), 695-706.—Evaluated 2 hypotheses concerning the basis of the association between performance on a simple RT task and the deceleration of heart rate found as the S responds. The RT task consisted of 96 trials in which the foreperiod was randomly varied between 2, 4, 8, and 16 sec. 2 groups of 31 healthy male undergraduates each were used, with the cardiac response blocked pharmacologically in 1 group, to determine if the occurrence of the cardiac response facilitated performance through an afferent feedback mechanism. 2 aspects of somatic activity, EMG bursts from chin muscles and eye movements and blinks, were also assessed to determine if the cardiac response and the associated behavioral facilitative effects were linked to a common mediating process involving cardiac deceleration and the inhibition of ongoing, task-irrelevant somatic activities. The latter hypothesis was consistently supported. Blocking the cardiac response did not significantly influence performance. However, a within-S analysis revealed a pronounced direct relationship between RT and the magnitude of the inhibition of somatic effects and the magnitude of the cardiac deceleration when the latter was not blocked pharmacologically. Data indicate that heart rate deceleration may not be significantly involved in an afferent mechanism but rather is more understandable as a peripheral manifestation of central processes. (17 ref.)—*Journal abstract*.

5842. Shapiro, David; Tursky, Bernard; Gershon, Elliot, & Stern, Melvin. (Harvard Medical School, Boston, Mass.) **Effects of feedback and reinforcement on the control of human systolic blood pressure.** *Science*, 1969(Feb), Vol. 163(3867), 588-590.—Describes an automatic procedure providing information about human systolic blood pressure at each successive heartbeat under routine laboratory conditions. 20 normal male 21-27 yr. old undergraduates were given feedback of their own systolic pressure, $\frac{1}{2}$ operantly reinforced for increasing and $\frac{1}{2}$ for decreasing their pressure. Significant differences in pressure were obtained in a single session. Apparatus and results suggest a possible approach to the treatment of essential hypertension.—*Journal abstract*.

5843. Sirotskii, V. V. (Bogomolets Inst. of Physiology, Kiev, USSR) **Vzaimootnosheniye mezhdu dykhatel'nyim, serdechnym i serdechno-sosudistym komponentami pishchevogo uslovnogo refleksa v ontogeneze u sobak raznogo tipa nervnoi sistemy.** [Interrelationship between the respiratory, cardiac and cardiovascular components of the alimentary conditioned reflex in ontogenesis in dogs with various types of nervous system.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 701-703.—6 dogs from the same litter were used in a study with 2 stages: determination of typological features and autonomic reactions from the age of 1-7 mo. and from 10-17 mo., with both states involving elaboration of a stereotype of alimentary secretory reflexes consisting of alternating positive and inhibitory acoustic stimuli. In response to the action of a positive CS in Ss with a "strong excitatory process," the growth of respiratory rate in different age periods was considerably lower than in those with a "weak type of nervous system." In the former, the action of the positive

CS was accompanied by a regular and distinct respiratory rhythm with slight inspiratory tonus of the rib cage; in the latter, great increase in the rate of respiration and disturbance of its rhythm were characteristic. In the former, the development of cardiac and cardiovascular components of the alimentary CS occurred more vigorously than in the latter. It is shown that there is no direct relation between the intensity of the autonomic components of the alimentary CR and those of the orienting reaction. The data provide a basis for concluding that "corrective influences" on respiration and the cardiovascular system in dogs begin to appear at a rather early age.—*I. D. London*.

5844. Thompson, Larry W. & Botwinick, Jack. (Duke U.) **Stimulation in different phases of the cardiac cycle and reaction time.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 57-65.—Tested the suggestion that RT may be related to variations in blood pressure which occur with each heart beat in a series of 4 studies in which possible effects of the preparatory interval (PI) were controlled. Stimuli were presented at 0, 200, 400, and 600 msec. following the R wave, and during the ascending slope of the R, T, and P waves of the cardiac cycle. No relationship was found in any of the 4 studies between RT and the phase within the cardiac cycle when the stimulus occurred.—*Journal abstract*.

5845. Thorne, Philip R., Engel, Bernard T., & Quilter, Reginald E. (Baltimore City Hosp., Gerontology Research Center, Md.) **An instrument for predicting the occurrence of the P-R interval of the normal human electrocardiogram.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 138-142.

ENVIRONMENT & STRESS

5846. Agadzhanian, N. A., Zakharova, I. N., & Kalyuzhnyi, L. V. (Inst. of Medicobiological Problems, Moscow, USSR) **Izmeneniya elektroentsefalogrammy i pishchevoi uslovnoreflektornoï deyatel'nosti posle kratkovremennoi glpoksii.** [Changes in the electroencephalogram and alimentary conditioned reflex activity after short-term hypoxia.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 369-371.—Simulated ascent to altitudes of 11,000-12,000 m. at the rate of 25 m/sec and similar descent in a barochamber for rabbits. The changes observed under conditions of short-term acute hypoxia are detailed in (a) previously elaborated alimentary motor CRs to a rhythmic photic stimulus; and (b) the accompanying EEGs, recorded from the hippocampus, mesencephalic reticular formation, and the lateral hypothalamus. Temporary acute hypoxia resulted in the disappearance of alimentary CR activity due to the development of a state of excitation, characteristic of stress, in primarily the structures of the nonspecific activating system of the subcortex.—*I. D. London*.

5847. Barofsky, I., Robinson, S. M., & Hurwitz, D. A. (Massachusetts Coll. of Pharmacy, Boston) **The effect of elevated temperature on food and water reinforced fixed ratio performance.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1243-1248.—Reports 3 experiments on the effect of elevated temperatures on food- and water-reinforced fixed-ratio (FR) performance. Ss were 11 male, experimentally naive Sprague-Dawley rats. In Exp. I the response rate reduced at a constant fixed-ratio requirement, while the change in body temperature remained relatively constant. In Exp. II

(food-reinforced) and III (water-reinforced) the FR response rate varied as an inverted U-shaped function of the FR requirement at both 25 and 35°C. Results of these experiments do not support a thermostatic theory of food-intake, since exposure to 35°C resulted in similar changes for food or water reinforced performance. As an alternative, it is proposed that thermogenic factors other than food, e.g., the work-requirement or ambient temperature, contributed to the changes in performance at 25° or 35°C. (19 ref.)—*Journal abstract.*

5848. Edelman, Robert I. (Florida Technological U., Orlando) **Validity of verbal report as a prognosticator of physiological arousal to threat.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 492-495.—Selected 40 male Ss on the basis of their avowed fear of electric shock and blood extraction with a hypodermic needle. Ss were subdivided into 4 equal groups. 1 group was fearful of both stimuli, a 2nd group avowed minimal fear to both stimuli. Each of the other groups feared 1, but not the other stimulus. Ss were then threatened with both stimuli in a counterbalanced order while heart rate was recorded. Since no threat was followed through, a credibility measure was obtained to determine if disbelief attenuated arousal. Results indicate that: (a) heart rate was differentially affected by threat and was generally consistent with avowed fear; and (b) there was some suggestion that disbelief attenuated the threat in that Ss were more likely to believe the initial than the subsequent threat and also showed greater heart rate acceleration to that initial threat.—*Journal abstract.*

5849. Jensen, Robert A. & Riccio, David. (Kent State U.) **Effects of prior experience upon retrograde amnesia produced by hypothermia.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1291-1294.—Administered to 33 adult male Holtzman Sprague-Dawley rats 1 of 3 types of experience prior to hypothermia: familiarization with the apparatus prior to training; training, extinction, and retraining; or training, hypothermia, and retraining. Each type of prior experience significantly diminished the amount of retrograde amnesia produced by hypothermia as compared with Ss which received a single training trial followed by hypothermia.—*Journal abstract.*

5850. Kruglikov, R. I. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **K voprosu o vremennoi organizatsii pamyati.** [On the temporal organization of memory.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 710-711.—141 mice were used to study (a) the comparative aspects of the retroactive and proactive action of electroshock on memory, and (b) degree of resultant retrograde amnesia as a function of the interval between elaboration of an electrodeceptive "CR of passive avoidance" and administration of electroshock, in order to elucidate the nature of memory deficit arising from subjection. Electroshock at different intervals of time after elaboration of the CR produced a gradual increase in resistance of the conditioned connection (memory trace) being formed to consolidation. At the same time electroshock before elaboration of the CR or testing of its retention did not hinder reinforcement and reproduction of the conditioned connection, i.e., did not exert much of a proactive action. Thus, disturbance of the process of transition of the memory trace from short- to long-term form was the chief effect caused by electroshock. The fact that this process was completed in approximately 2 hr. after elaboration of the CR is evidence for the coexistence of developing long- and short-term memory.—*J. D. London.*

5851. Patton, Gary W. (Indiana U., Pa.) **Combined autonomic effects of concurrently-applied stressors.** *Psychophysiology*, 1970(May), Vol. 6(6), 707-715.—Attempted to determine if 2 stressors applied simultaneously produce greater sympathetic nervous system (SNS) activity than does 1 stress acting alone. Exp. I was undertaken to ensure that each stress, when compared with a nonstress condition, independently produced increased SNS activity. To this end, 24 United States Army enlisted men (a) solved anagrams, (b) underwent seminude exposure to 50° F cold, and (c) watched a comedy movie. SNS activity during a and b was independently compared with c. Subsequently, in Exp. II, Ss' responses during a single stress (55° F cold exposure) were contrasted with those recorded during a dual stress condition (anagram solving during 55° F cold exposure). Each stress independently produced increased SNS activity, and the 2 stressors combined produced more SNS activity than did cold exposure alone. (20 ref.)—*Journal abstract.*

5852. Seligman, Martin E. & Meyer, Bruce. (U. Pennsylvania) **Chronic fear and ulcers in rats as a function of the unpredictability of safety.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 202-207.—A variable number of unpredictable electric shocks presented to 20 male Sprague-Dawley albino rats bar pressing for food produced substantial nontransient suppression across 70 sessions. With a fixed number of otherwise unpredictable shocks in each session, Ss recovered by pressing after the last shock, using its occurrence as a safety signal. When signals predicted a variable number of shocks Ss bar pressed in the absence of the CS and not in its presence. Pressing recovered with milder predictable shock and more slowly with mild unpredictable shock. Inhibition of delay was found in predictable shock groups. Fear, measured by suppression, correlated with gastrointestinal ulceration ($p = .74$). Findings confirmed a safety-signal explanation of the effects of unpredictable shock.—*Journal abstract.*

5853. Simmonds, M. A. & Iversen, L. L. (U. Cambridge, England) **Thermoregulation: Effects of environmental temperature on turnover of hypothalamic norepinephrine.** *Science*, 1969(Jan), Vol. 163(3866), 473-474.—The hypothesis that norepinephrine is a transmitter in the temperature-regulating center of the hypothalamus is based on observations of changes in the rectal temperatures of animals after injections of norepinephrine into the hypothalamus. By introducing tritiated norepinephrine as a label into the endogenous norepinephrine stores in the brain and then measuring the disappearance of tritiated norepinephrine from discrete areas, the activity of norepinephrine-containing neurons in those areas can be monitored. In an experiment with male Wistar rats, it was found that when S is exposed to heat, the turnover of endogenous norepinephrine appears to be increased selectively in the hypothalamus, whereas exposure to cold has no effect.—*Journal abstract.*

GENETICS

5854. Hartlage, Lawrence C. (Indiana U., Medical Center, Indianapolis) **Sex-linked inheritance of spatial ability.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 610.—Measured inheritance of spatial ability using

Differential Aptitude Test space scores from 100 combinations of mother-son, father-son, mother-daughter, and father-daughter pairs. Obtained correlations were in agreement with earlier findings suggesting that spatial ability may be transmitted by an X-recessive gene.

5856. Tiwari, S. C. & Bhasin, M. K. (U. Delhi, India) **Frequency of colour blindness and hand clasping in two endogamous caste groups of Garhwal.** *Human Heredity*, 1969, Vol. 19(1), 110-112.—Presents the frequency of color blindness and hand clasping of 2 endogamous caste groups of Garhwal. The incidence of color blindness among the Brahmins is 4.96% and Rajputs 3.20%. The frequency of hand clasping of R type is 53.67% among Brahmins and 50.20% in Rajputs. The intergroup differences were statistically nonsignificant.

PERSONALITY CORRELATES

5857. Bailey, William L., Shinedling, Martin M., & Payne, I. Reed. (Brigham Young U.) **Obese individuals' perception of body image.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 617-618.—To test differences in size of body image of underweight, normal weight, and overweight people, 105 undergraduates were administered a Draw-A-Person test. The torso and head of the figure drawings were each assigned a number from 0-3 according to the degree their dimensions represented obese characteristics. Obese Ss drew significantly larger figures, indicating larger body images than normal or underweight Ss.—*Journal abstract.*

5858. Colman, Arthur D. (Walter Reed Army Inst. of Research, Washington, D.C.) **Psychological state during first pregnancy.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 788-797.—Studied 6 women in group, hospital, and home settings from the beginning of their 1st pregnancy for 15 mo. Their psychological state is discussed in terms of altered field on consciousness, medical symptoms and concerns, and approaches and reactions to labor and delivery.—*Journal abstract.*

5859. Curtis, George; Fogel, Max; McEvoy, Donald, & Zarate, Carlos. (Eastern Pennsylvania Psychiatric Inst., Philadelphia) **Urine and plasma corticosteroids, psychological tests, and effectiveness of psychological defenses.** *Journal of Psychiatric Research*, 1970(Jul), Vol. 7(4), 237-247.—The significant psychological correlates of urinary 17-hydroxycorticosteroids (17-OHCS) were more numerous and more consistent across sexes than the correlates of plasma 17-OHCS. The best psychological predictors of urinary 17-OHCS were scores on the Taylor MA scale and the Leary Hostility Scale, both positively related, and the Nowlis Social

Affection Scale (negatively related). No relationship was found between effectiveness of defenses and plasma 17-OHCS. (32 ref.)—*R. V. Hamilton.*

5860. Dunham, Frances Y. (U. North Carolina, Greensboro) **Timing and sources of information about, and attitudes toward, menstruation among college females.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 205-217.—189 undergraduates completed questionnaires about source and timing of information about menstruation, attitudes toward menstruation at menarche and at the present time, and transient feelings during the menstrual period. Sources were divided into those giving a 1st hint and those giving detailed information: mothers gave information less frequently while peers more frequently gave 1st hints and less frequently gave detailed information than has previously been reported. Few girls in this sample had no information about menstruation prior to menarche. Transient feelings during menstruation indicated mild psychological discomfort, but more permanent attitudes seemed to be a denial that menstruation was special in either a positive or negative way. (16 ref.)—*Author abstract.*

5861. Frith, C. D. (London U., Inst. of Psychiatry, England) **Personality, nicotine and the salivary response.** *Life Sciences*, 1968(Nov), Vol. 7(22, Pt. 2), 1151-1156.—Measured the salivary response of 20 normal adult volunteers to lemon juice under nicotine and placebo using B. W. Feather's improved salimeter. Nicotine significantly increased the difference between response and resting level. There was a significant negative correlation between extraversion score and resting level of secretion and a significant positive correlation between extraversion score and difference between resting level and the response to the 2nd of a pair of lemon juice stimulations. The apparatus was found satisfactory with regard to the collection and measurement of saliva, but not with regard to the delivery of the stimulus.—*Journal summary.*

5862. Roessler, Robert & Collins, Forrest. (Baylor U., Coll. of Medicine) **Personality correlates of physiological responses to motion pictures.** *Psychophysiology*, 1970(May), Vol. 6(6), 732-739.—Examined skin conductance (SC) and heart rate (HR) responses to rest, to a bland and to a stressor motion picture film in 20 paid male volunteers. Ss were divided equally into a high ego strength (Es) and a low Es group on the basis of their scores on the Barron scale of the MMPI. These groups were balanced for film presentation order and did not differ significantly on trait anxiety as measured by the MA scale. The Zuckerman multiple affect adjective check list was administered before and after both the stressor and the bland film. High Es Ss were more responsive in SC and HR under all 3 conditions and showed a greater range of SC values than did low Es Ss. Subjective states paralleled physiological states. High Es Ss reported significantly greater state anxiety than did low Es Ss. (15 ref.)—*Journal abstract.*

5863. Schuman, Elliott P., Kessel, Paul, & DeBold, Richard C. (Long Island U.) **Mytonometry: A method for estimating tenseness and anxiety by measuring muscle hardness.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 479-482.—Data from the mytonometer are different from those yielded by the EMG in that the actual state of the muscles is measured and not the electrical activity at the motor end plates. Additional exploration of the method is suggested. The method appears to be a promising means of evaluating physi-

ological and psychotherapeutic processes and outcomes.

5864. Spiegel, Rose. **Las depresiones y la situación femenina.** [Depressions and the feminine situation.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1969, No. 11, 47-58.—Discusses the physiological and psychological bases for depression in women. Premenstrual, postpartum, and menopausal depressions are considered with regard to relating the effects of hormonal fluctuations to states of mind. These are also related to social and cultural conditions which may contribute to depression, i.e., cultural emphasis on youth and beauty, social pressure to be married. It is believed that a principle element in a woman's existence is time. A woman's dependence on menstrual cycles and a sense of the correct time for marriage and giving birth are believed to be a source of anguish and desperation which may cause depression. It is concluded that depression in women is influenced by many factors, in sexuality as well as in maturity and interpersonal experience.—P. Hertzberg.

5865. Strausbaugh, Larry J. & Roessler, Robert. (Baylor U., Medical School, Houston, Tex.) **Ego strength, skin conductance, sleep deprivation, and performance.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 671-677.—7 high ego strength (Es) Ss demonstrated significantly higher levels of skin conductance (SC) during performance following 1 night's sleep deprivation and higher levels of performance following sleep deprivation than 7 low Es Ss. No significant Es group differences in SC levels or performance following sleep were observed.—*Journal abstract.*

5866. Waters, William F. (U. Missouri, Medical School) **Sympathetic recovery in defensive responding.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 355-360.—Recorded verbal responses, skin conductance, heart rate, and muscle potential responses of 18 male undergraduates responding to insults, compliments, and neutral statements with defensive responses (free, covert, and irrelevant), impaired defensive responses, and nondefensive responses. Results reveal that freely emitted defensive responses were followed by significantly greater rates of sympathetic recovery than those following nondefensive responses and impaired defensive responses. The expected relationship between rate of sympathetic recovery and frequency of free defensive response emission was not found. Results indicate that defensive responding leads to unusually rapid sympathetic recovery rates and that sympathetic recovery rates are in part determined by the efficacy of escape responses to aversive stimuli ("escapability").—*Journal abstract.*

NUTRITION & GASTROINTESTINAL PROCESSES

5867. Booth, D. A., Chase, Aileen, & Campbell, A. T. (U. Sussex, Brighton, England) **Relative effectiveness of protein in the late stages of appetite suppression in man.** *Physiology & Behavior*, 1970(Nov), Vol. 5(11), 1299-1302.—16 human Ss took a protein-rich or a protein-poor lunch and 2-3 hr. later a supplementary meal of average protein content. Total caloric intake for the 2 meals was lower when the main meal contained a high proportion of protein. Therefore, calorie for calorie, amino acids contribute more than carbohydrates and fats to the suppression of hunger in the postabsorptive period.—*Journal abstract.*

5868. Brown, Clinton C. (Maryland State Psychiatric Research Center, Baltimore) **The parotid puzzle: A review of the literature on human salivation and its applications to psychophysiology.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 66-85.—Presents a survey of the literature on human salivation with emphasis upon the influence of normal and psychopathologic emotional states as they affect alterations in factors relating to flow rate. Neurological and physiological features of the gland, individuality of response, results of classical and operant conditioning, and suggested areas for future research are discussed. (3 p. ref.)—*Journal abstract.*

5869. Grechishkin, L. L. & Mustafina, T. K. (Inst. of Experimental Medicine, Leningrad, USSR) **Soderzhanie gistamina i serotoninina v stenke zheludka u krys pri razvitií neirogennoi distrofii.** [Level of histamine and serotonin in the gastric wall in rats as a result of the development of neurogenic dystrophy.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970, Vol. 69(3), 31-33.—140 white rats, in which lesions of the gastric mucosa were created through simultaneous immobilization and electrical stimulation for 3 hr. served as Ss. The level of histamine and serotonin was raised as a result of the preparation of the Ss. A positive correlation existed between the level of the 2 agents and the number of ulcerous lesions. It appears that endogenic histamine and serotonin play a prominent role in the development of destructive affections of the gastric mucosa.—I. D. London.

5870. Scrimshaw, Nevin S. (Massachusetts Inst. of Technology) **Early malnutrition and central nervous system function.** *Merrill-Palmer Quarterly*, 1969(Oct), Vol. 15(4), 375-387.—"Severe malnutrition, when it occurs very early in the life of experimental animals, permanently impairs the development of the brain and subsequent learning and behavior. Sensory deprivation may have the same effect.... In developing countries, however, and perhaps in populations of the slums and ghettos of the world's cities, malnutrition and its synergism with infection may be more significant for some children than variations in family education, economic status, and cultural practices. Although genetic factors are important determinants of individual potential, they do not account for the major differences between privileged and underprivileged populations. Malnutrition is a major factor in the high morbidity and mortality of infants and pre-school children in developing countries." (30 ref.)—R. V. Hamilton.

ANIMAL PSYCHOLOGY

5871. Akhtar, M. (Slippery Rock State Coll.) **Rats rut Pakistani psychology.** *Pakistan Journal of Psychology*, 1970(Jun), Vol. 3(1-2), 17-26.—Describes the conditions leading the author to an interest in animal psychology and the subsequent development of the 1st rat colony in Pakistan. It is suggested that work in animal psychology, although currently engaged in by very few psychologists in Pakistan, marks an important advance in Pakistani psychology. A rationale for animal psychology is presented, with emphasis upon the ultimate application to problems of human behavior. The various advantages of animal study are discussed. A brief outline of the research generated by the recently established rat colony is presented.—R. Wiltz.

5872. Dethier, V. G. & Stellar, Eliot. (Princeton U.)

Animal behavior. (3rd ed.) Englewood Cliffs, N.J.: Prentice-Hall, 1970. viii, 152 p. \$6.95(cloth), \$3.25(paper).

5873. Imlay, Marc J. (Northwestern U.) **A dual behavioral interpretation of a single environmental stimulus with freshwater mussels.** *Annual Reports of the American Malacological Union*, 1969, 21-22.—Examines the observation that clams will close when the external stimulus is harmful, but will open in beneficial environments. Evidence is presented that through changes in light, vibrations, and altered aeration of water, a dual response to a single stimulus will sometimes occur in the behavior of clams, i.e., a stimulus initially producing closing can sometimes be followed by an opening response.—P. McMillan.

5874. Kefuss, J. A. & Nye, W. P. (Inst. fur Bienenkunde, Polytechnische Gesellschaft, Oberursel/Taunus, Im Rosengarten, W. Germany) **The influence of photoperiod on the flight activity of honeybees.** *Journal of Apicultural Research*, 1970, Vol. 9(3), 133-139.—Honeybees (*Apis mellifera ligustica*) of similar genetic lines, and sister queens (inseminated with the same drone line) were maintained in controlled environment rooms in glass-walled observation hives. As the photophase was lengthened, flight activity per unit time decreased. Bees develop flight patterns in response to cycles of light and dark and can be conditioned to high flight activity at times other than their normal peak flight times. Continuous light seemed to provide the best environment for testing biorhythms that are not associated with light and dark periods, since the rhythms of bee flight tend to fade with continuous light. It is concluded that possibly all honeybee castes have a flight rhythm controlled or influenced by photoperiod, which is obvious in the queen and drone flights but less evident in workers due to weather and foraging factors present.—W. E. Wood.

COMPARATIVE PSYCHOLOGY

5875. Dodwell, P. C. (Ed.) (Queen's U., Kingston, Ontario, Canada) **Perceptual learning and adaptation: Selected readings.** Baltimore, Md.: Penguin Books, 1970. 501 p. \$2.65(paper).

5876. Iskander, T. N. & Kaelbling, Rudolf. **Catecholamines, a dream sleep model, and depression.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 43-50.—To test a theoretical model which states that reduced catecholamine levels and an increase in paradoxical sleep are involved in depressive illness, 12 cats were prepared for polygraph recording with a cortical EEG and 8 Ss were injected with 80 mg/kg of laevo-alpha-methylparathyosine (AMPT) to inhibit catecholamine synthesis. Results indicate that as catecholamine levels decreased, paradoxical sleep increased. Some features of sleep and severe depression are reviewed in the light of theoretical considerations. (60 ref.)—P. R. Shibelski.

5877. Lippman, Louis G., Galosy, Richard A., & Thompson, Richard W. (Western Washington State Coll.) **Passive-avoidance learning in gerbils and rats.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 269-273.—Compared 20 male albino Sprague-Dawley rats and 30 male Mongolian gerbils on acquisition and retention of a 1-trial nonshock step-through passive-avoidance task. Results of Exp. I

indicate that the rats learned the response in 1 trial and then showed extinction-forgetting. The gerbils, which had initially shorter step-through latencies than rats, showed no learning from Trial 1 to 2, but continued to increase latencies over all days of testing. The effect of habituation to handling on the acquisition and retention of the avoidance response was investigated in Exp. II. Habituation to handling facilitated passive-avoidance acquisition in both species and yielded trends in performance which were similar to those obtained in Exp. I.—*Journal abstract*.

5878. Lorenz, Konrad. (Max-Planck Inst., Seewiesen, W. Germany) **Studies in animal and human behaviour: I.** Trans. R. Martin. Cambridge, Mass.: Harvard U. Press, 1970. xx, 403 p. \$10.

5879. Singh, Devendra. (U. Texas) **Preference for bar pressing to obtain reward over free-loading in rats and children.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 320-327.—Examines the preference behavior in a choice situation where an effortful and a relatively effortless response lead to the same reinforcer. 30 female Holtzman albino rats were trained to obtain food free or by bar pressing. Following equal amounts of training, the Ss were tested for 4 days for preference for bar pressing. Results indicate that Ss prefer to obtain food by bar pressing even when amount of work (FR-1, FR-3, and FR-11) is varied, and food can be obtained faster on the free side. An experiment with children also demonstrated a similar preference for bar pressing to obtain marbles.—*Journal abstract*.

NATURAL OBSERVATION

5880. Bock, Carl E. (Museum of Vertebrate Zoology, Berkeley, Calif.) **The ecology and behavior of the Lewis woodpecker (*Asyndesmus Lewis*).** *University of California Publications in Zoology*, 1970, Vol. 92, 91 p.—In terms of feeding ecology and behavior, the Lewis woodpecker is basically an opportunistic species. During the breeding season it feeds largely by hawking insects and thus prefers open habitat. Its feeding methods (flycatching, ground-brush foraging, gleaning) are described and compared to other species of woodpeckers. In winter it relies on stored mast (e.g., acorns). Each individual (rarely a pair) harvests, shells, and stores its own cache. This storage site is defended; interspecific competition is most important, and more frequent in winter than during the breeding season. The breeding vocalizations and displays of Lewis woodpeckers are described. Time of breeding correlates with altitude and local weather conditions and thus insect availability. (9 p. ref.)—P. L. Borchelt.

5881. Bovet-Nitti, Filomena; Oliverio, Alberto, & Bovet, Daniel. (U. Sassari, Italy) **Avoidance learning in inbred BALB/C mice raised as only children or siblings.** *Life Sciences*, 1969(Jun), Vol. 8(12, Pt. 2), 569-574.—Assessed the effect of different early environments as measured by adult avoidance learning in inbred BALB/C mice raised singly or in groups of siblings. At the age of 60 days single Ss were heavier and attained higher levels of performance in a shuttlebox avoidance task. Results show that mother-infant relationships seemed to be more important than those between siblings of the same litter. (17 ref.)—*Journal summary*.

EARLY EXPERIENCE

5882. Ardila, Ruben. (National U., Bogotá, Colombia) **Trabajos experimentales sobre los efectos de las experiencias tempranas en la conducta posterior.** [Experimental studies on the effects of early experience on subsequent behavior.] *Revista de Psicología*, 1967, Vol. 12(1-2), 75-83.—Presents a brief review of the field of early experience, including methodology, determining factors, imprinting, the notion of critical periods, and representative experiments. (19 ref.)—*L. Zusne.*

5883. Biggs, Walter C. (North Carolina State U., Raleigh) **Suckling behavior of domestic swine in farrowing-barn and penned-woods environments.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 2-3.

5884. Hershberger, Wayne. (Northern Illinois U.) **Attached-shadow orientation perceived as depth by chickens reared in an environment illuminated from below.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 407-411.—The depth perception of 10 leghorn chickens reared in cages illuminated from below was tested using photographed dents with shadow orientation the relevant cue. Ss assumed an overhead source of illumination seeing dents shaded below and above as convex and concave, respectively. There appears to be an innate perceptual parameter corresponding to an overhead source of illumination in terms of which orientation of attached shadow is interpreted as depth.—*Journal abstract.*

5885. King, Donald L. (Queensborough Community Coll., City U. New York) **Effect of early experience and litter on some emotionality variables in the rat.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 436-441.—Reports of significant litter effects on emotionality, weight, and maturational measures suggest that the significant effects of early experience that have been reported may have been due to uncontrolled litter effects. The effects of early experience and litter on open-field, emerge-from-home-cage, timidity, and avoidance-conditioning measures of the Sprague-Dawley rat (N = 80, 80, 58, and 40) were therefore determined. Significant effects of early experience and litter were not obtained. It is concluded that this result is representative of a continuing list of nonreplications in the early experience emotionality area. An explanation of some of the failures to replicate is discussed. (16 ref.)—*Journal abstract.*

5886. Lagerspetz, Kirsti & Heino, Tuula. (U. Turku, Finland) **Changes in social reactions resulting from early experience with another species.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 255-262.—28 male mice were reared by rat-mothers and siblings from the age of 1-3 days, whereas controls were reared with mouse-mothers and siblings. When adults, both groups preferred their foster-species in a social-preference test. More aggression was directed toward a mouse-partner than toward a rat-partner in both groups. The mouse-reared group was generally more aggressive than the rat-reared group. The rat-reared group showed no aggression toward rats. Being reared by rats decreased the sexual behavior toward mice. No copulation with small (prematurely oestrous) female rats occurred, but sexual interest was shown by the rat-reared Ss. Aggressive responses toward the female partner occurred significantly more often when the female did not belong to the fostering species. No differences in open-field activity were found.—*Journal abstract.*

INSTINCTS

5889. Fischer, Gloria J. (Washington State U.) **Arousal and impairment: Temperature effects on following during imprinting.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 412-420.—Found that following during imprinting was negligible if white leghorn chicks (N = 135) were imprinted at a temperature warmer or the same as the one to which they had been adapted. Following was very substantial, however, if Ss were imprinted at a temperature colder than the one to which they had been adapted. This experienced cold effect subsequently held constant over a range of adaptation-to-imprinting temperatures approaching extremes of hot or cold. Also, the magnitude of the effect 1st increased, then decreased, as imprinting temperature was decreased from a constant adaptation level. The decline was shown to be related to: time, overt behavior, body temperature, and distress calling in ways suggesting probable physiological impairment from adaptation to cold, rather than any decline in the stimulative, i.e., neural arousal effects of experienced cold.—*Journal abstract.*

5890. Lee, Ching-tse. (Bowling Green State U.) **The nest-building behavior of inbred mice: Developmental and genetic studies.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 931.

5891. Shapiro, L. James. (Bowling Green State U., Center for Research on Social Behavior) **Experimental control and automation in a laboratory for imprinting research.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 421-426.—Offers a prototype for an automated imprinting laboratory. By controlling as many extraneous variables as possible and by eliminating the E from the recording of the dependent variable, it is hoped that variance due to these 2 sources will be reduced, if not eliminated. It is noted that increased variance due to laboratory conditions and E expertise may result in a lack of statistically significant results when, in fact, such results have only been masked by a large error term. With the prototype offered it may be possible to introduce some degree of standardization to the procedures and apparatus used in imprinting research.—*Journal abstract.*

MOTIVATION & EMOTION

5892. Barnett, S. A. & Smart, J. L. (U. Glasgow, Scotland) **Activity of inbred and F₁ mice in a residential maze.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 494-502.—Studied 12 male mice each of strains A2G/Tb, C57BL/Tb, and the F₁ produced by crossing them for 3 days in an artificial environment (a "plus-maze"), in which movement was recorded automatically. There was a central nest box with an opaque cover, from which 3 passageways led to food, water, and soft wood, respectively; a 4th arm was

left empty. The number of visits to the arms was always highest on the 1st day. On a given day, the number of visits was much the same for each arm, i.e., it was not influenced by the incentives. In contrast, while time spent out of the nest box was about the same from day to day, the time spent in individual arms differed greatly and was in the order food > balsa wood > water > empty arm. In terms of visits, the F₁ and C57BL/Tb Ss were more active than A2G/Tb; and the F₁ Ss varied less than either inbred strain. The lack of correspondence between visits and duration of stay is discussed in relation to the concept of neophilia.—*Journal abstract.*

5893. Gallup, Gordon G., Nash, Richard F., Potter, Randolph J., & Donegan, Nelson H. (Tulane U.) **Effect of varying conditions of fear on immobility reactions in domestic chickens (*Gallus gallus*).** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 442-445.—3 studies were run to test the fear hypothesis of immobility reactions in Production Red chickens (N = 48, 40, and 20). Exp. I, as a replication of earlier work, found significantly enhanced immobility on the part of Ss given preinduction electric shock. Exp. II showed that duration of immobility varied reliably as a function of the amount of shock. Exp. III demonstrated that a similar enhancement could be produced by brief preinduction exposure to a loud noise.—*Journal abstract.*

5894. Gilbert, R. M. & Sherman, I. P. (Alcoholism & Drug Addiction Research Foundation, Toronto, Ontario, Canada) **Palatability-induced polydipsia: Saccharin, sucrose, and water intake in rats, with and without food deprivation.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 319-325.—The 24-hr intake of saccharin and sucrose solutions was higher when 36 male, black-hooded rats were maintained at reduced body weights than when food was freely available. Intake of both kinds of solution during 3-hr tests, as a proportion of 24-hr intake, increased with concentration. Water consumption outside of tests reflected solution consumption during tests. Results suggest that the increased intake of sucrose solutions during deprivation is at least partially dependent on palatability.—*Journal abstract.*

5895. Nyström, Mats. (Lund U., Sweden) **The development of stimulus preferences in the pecking behaviour of young herring gulls (*Larus argentatus*): IV. Experience with a rearranged world of hues.** *Psychological Research Bulletin, Lund U.*, 1970, Vol. 10(2), 13 p.—Hypothesized that perceptual learning of figure and background qualities would contribute to the red preference in pecking behavior of nest reared herring gulls. Exp. I confirms this general idea in the sense that a difference was found between groups exposed to normal and rearranged hue situations. However, the effect was opposite to what was expected. Results of Exp. II show that exposure to background hues increase preference. Exp. III shows that hues with figure qualities decrease the particular preference. Therefore, it is concluded that exposure to the parents' red bill coloration or to the green background in nature cannot result in higher preference for red.—*Journal abstract.*

5896. Porcheron, Rex F. (U. Sydney, New South Wales, Australia) **Drive differences and level of extraneous stimulation.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 149-157.—Considered G. A. Cicla's (see PA, Vol. 39:1071) and J. W. Cotton's (see PA, Vol. 28:7139) studies which investigated drive differences with reduced level of extraneous stimulation. It is concluded that the findings were not necessarily

contrary to the theory of drive proposed by Estes, as had been implied in Cicla's study. Experimental evidence in support of this conclusion was obtained. The theoretical implications of increasing level of extraneous stimulation were considered for the Hull-Spence and Estes theories which allow opposite predictions under these conditions. These were tested in 2 experiments with 28 male albino rats each which produced clear support for the Estes prediction. There were certain reservations in rejecting the Hull-Spence prediction.—*Journal abstract.*

5897. Revusky, Bow T. (Northern Illinois U.) **Failure to support the hypothesis that eating is anticipatory of need.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 199-205.—Contends that J. Le Magnen's reported evidence that eating is a response to an anticipated rather than existing nutritional deficit is based upon a statistical artifact. In an attempt to obtain the anticipatory effect, a modified procedure was used: 1 meal preceded a long interval and followed a short interval, the other meal preceded a short interval and followed a long interval. Insofar as eating is anticipatory, more should be eaten at the meal which precedes the long interval than at the meal that precedes the short 1. If eating is a response to an existing deficit, then more should be eaten at the meal that precedes the short interval because this meal also follows the long intermeal interval. There was no systematic relationship between the length of the intermeal interval (either preceding or following a meal) and the amount consumed.—*Journal abstract.*

5898. Sheldon, M. H. (U. Newcastle upon Tyne, England) **Effect of electric shock on rats' activity in familiar and unfamiliar environments.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 374-377.—Found that electric shock delivered before exposure to a Y-maze reduces the activity of 48 hooded female rats whether the maze is familiar or unfamiliar. Increasing familiarity with the maze reduces activity for shocked and unshocked Ss. It is argued that this finding presents difficulties for theories according to which exploratory behavior depends on fear.—*Journal abstract.*

5899. Strongman, K. T., Coles, G. H., Remington, R. E., & Wookey, P. E. (U. Exeter, England) **The effect of shock duration and intensity on the ingestion of food of varying palatability.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 521-525.—150 23-hr deprived male albino Sprague-Dawley rats were run in a 2 × 5 × 3 balanced analysis of variance design to determine the effect of prior shock on food intake. The main factors were time spent in shock box (3, 30 sec.), intensity of shock (0, .5, 1.5, 2.5, 3.5 mA) and percentage of sucrose adulteration of food (0, 10, 25%). Results show a general enhancement of intake following 3-sec shock and a suppression following 30-sec shock. Variations in shock intensity were of no significance.—*Journal abstract.*

LEARNING

5900. Bellingham, William P. (U. New Mexico) **Stimulus compounding and generalization.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 405-406.

5901. John, E. R., Shimokochi, M., & Bartlett, F. (New York Medical Coll., New York) **Neural readout from memory during generalization.** *Science*, 1969(Jun), Vol. 164(3887), 1534-1536.—Trained 8 cats

with implanted electrodes to obtain food on presentation of 1 flicker frequency and to avoid shock on presentation of a 2nd. A 3rd flicker frequency, midway between the 1st and 2nd, was then presented. Differential generalization ensued, in which either the food response or the avoidance response was performed. Average evoked potentials from generalization trials with different outcomes were significantly different. The wave shape elicited by the stimulus for generalization closely resembled the usual response to the appropriate signal for the behavior which was displayed. This constitutes evidence for release of a neural process representing previous experience. The release of this process begins about 35 msec. after stimulation.—*Journal abstract.*

5902. Miller, Neal E. (Rockefeller U.) **Learning of visceral and glandular responses.** *Science*, 1969(Jan), Vol. 163(3866), 434-445.—Presents a series of experiments suggesting that instrumental learning of visceral responses, long held impossible, can be demonstrated. A new possible homeostatic mechanism is suggested. Studies cast doubt on "the hypothesis that there are 2 fundamentally different mechanisms of learning, involving different parts of the nervous system." Implications of these findings for understanding of psychosomatic symptoms, individual and cultural differences, and therapeutic training are discussed. (39 ref.)—*P. McMillan.*

5903. Moise, Samuel L. (U. California, Center for the Health Sciences, Los Angeles) **Short-term retention in *Macaca speciosa* following interpolated activity during delayed matching from sample.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 506-514.—Ran 3 experiments to examine the effects upon short-term memory of an interpolated motor activity under stimulus control with 1 female and 2 male stump-tail macaques. Responding to a white-light stimulus during delays of the delayed matching-from-sample task served as interpolated activity. Percentage of correct responses shows significant performance deficits due to amount of interpolated activity but not point of interpolation during delays. Latencies of incorrect responses were longer than latencies of correct responses for all experimental conditions. The absence of significant change in performance over time suggests that basic properties of short-term memory were being manipulated. (19 ref.)—*Journal abstract.*

5904. Ricciardi, A. Michael & Treichler, F. Robert. (Kent State U.) **Prior training influences on transfer to learning set by squirrel monkeys.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 314-319.—Trained 12 squirrel monkeys under 1 of 3 object-discrimination conditions: 60 successive reversals of a single problem to criterion (Group SRT), 60 object problems to criterion (Group MDT), or 60 sessions of training on a single problem (Group AC). Subsequently, all groups were tested on a 6-trial learning set (object-discrimination learning-set; ODLS). Group MDT was significantly better than Group AC. Group SRT was intermediate, but not significantly different from the other groups on proportion correct. Conditional probabilities were computed for 2-trial sequences in test, and win-stay scores were equally high for all groups. Group MDT showed lose-shift performance superior to Groups SRT and AC, and the latter did not differ from 1 another. Facilitative effects of SRT on ODLS may partially result from adaptation to the task situation.—*Journal abstract.*

Conditioning

5908. Aronova, Z. A. (Pavlov Inst. of Experimental Medicine, Leningrad, USSR) **K voprosu o formirovani zastoynnykh ochagov vzbuzhdeniya pri obrazovanii oboronitel'nykh uslovykh refleksov u sobak.** [On the formation of inert foci of excitation in the development of defensive conditioned reflexes in dogs.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 540-542.—2 Ss with surgically exteriorized tongues were used to study the formation and appearance of a dominant focus of excitation as a result of the application of an intense stimulus (electric current) in the capacity of a CS. The data suggest that, as a result of the systematic application of an electrode defensive stimulus, a dominant focus of excitation is formed in the functional structures of the CR. The utilization of electric current in the capacity of a CS, leaving a long retained excitatory trace after its action, promoted the quick cumulation of latent excitation in the dominant focus and created the conditions for its transition to a high degree of "persistent stationary excitation." This was manifested, in the beginning, in the disappearance of reflexes to an intense CS (current), later to a less intense CS (bell), and in the retention of reactions (paw lifting) to weak indifferent stimuli.—*I. D. London.*

5909. Asratyan, E. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **O mekhanizme i lokalizatsii uslovnogo tormozheniya.** [On the mechanism and localization of conditioned inhibition.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 195-211.—Presents an analysis of the data and various hypotheses on (a) the physiological mechanisms involved in the emergence of internal or conditioned inhibition, and (b) the localization of this inhibition within the framework of the CR arc. Pavlov's basic ideas can be retained if the "center of gravity of the events connected with the development of internal inhibition" be shifted away from the cortical cells associated with the CS to the intermediate link of the CR arc.—*I. D. London.*

5910. Carman, John B. (U. North Dakota) **Deprivation levels and conditioned suppression.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 599-602.—Increases in body weight and decreases in the preexperimental session deprivation times increased the severity of previously established conditioned suppression for a male hooded rat. The degree of operant suppression resulting from the body weight and deprivation time manipulations differentially affected response rates during successive segments of the preshock stimulus.—*Journal abstract.*

5911. Daurova, F. K. & Kolotygina, R. F. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Rol' sootnositel'noi sily komponentov bezuslovno razdraditel'nykh v funktsionirovani raznorodnykh binarnykh uslovykh reflektsov.** [Role of relative strength of unconditioned stimulus components in the functioning of heterogeneous binary conditioned reflexes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 387-394.—Studied the significance of the relative strength of the excitatory foci of 2 components of UCR in the functioning of heterogeneous binary CRs. Ss were 2 dogs with stable heterogeneous CRs to an 1100-cps tone with reinforcing stimulus consisting of food and electric current, simultaneously presented, and the strength of the painful component of the stimulus undergoing change along with constant alimentary reinforcement. It is shown that the magnitude of the conditioned defensive-motor component is a direct function of the strength of the electrodeceptive UCS. The interrelationships between the alimentary and the defensive-motor components of the binary CR bear an antagonistic character. The interrelationships between the components of the binary CR are seen to be the result of (a) the interaction of the foci of excitation in the structures tied to the alimentary and defensive-motor UCSs, and (b) the interrelationships of the elements constituting the conditioned connections themselves. Thus, weakening of the nociceptive stimulus leads to increased conditioned salivation. Enhancement of its intensity, however, leads to a decrease in conditioned salivation to the point of the latter's complete disappearance. Thus, the conditioned alimentary component is depressed in a binary CR in case a considerable increase in excitation is induced by the nociceptive stimulus-component.—*J. D. London.*

5912. Dolbakyan, E. E. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Issledovanie porogov pervichnykh otvetov u sobak s oboronitel'nymi instrumental'nymi reflektami.** [Study of the thresholds of primary responses in dogs with defensive instrumental reflexes.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 261-269.—Used 6 dogs in an electrophysiological study of (a) the threshold dynamics of primary responses to electrodermal stimulation in the sensory and motor representatives of the right forepaw, and (b) those of the motor reaction of that forepaw during the elaboration of primary (escape) and secondary (avoidance) electrodeceptive instrumental reflexes. A significant decrease was noted in all threshold indices after elaboration of the primary reflex (raising of paw and maintenance in lifted position). On the basis of the primary reflex, a secondary reflex to a distant stimulus (clicks) was elaborated in 2 Ss. In the secondary reflex the thresholds of the primary responses were increased to initial magnitudes, but the threshold of the motor reaction remained at the same lowered level as

obtained in the primary reflex. The divergence between primary response thresholds and the threshold of motor reaction is taken as evidence for (a) the displacement of the center of activity to the efferent part of the "system of the reinforcing stimulus," and (b) the connection of the analyzer of the CS primarily with the efferent link of the reinforcing reflex.—*J. D. London.*

5914. Ioffe, M. E. & Andreev, A. E. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **O mezhkonechnostnoi koordinatsii pri osushchestvlenii lokal'nykh dvigatel'nykh uslovykh reaktsii u sobak.** [On coordination between extremities in the effectuation of local motor conditioned reactions in dogs.] *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 557-565.—11 dogs were used to study the postural and local components of complex alimentary instrumental reflexes (eating from a food trough held in place by means of a raised foreleg attached by a lever to it). In the quiet standing state, pressure on the forelegs came to 55-60% of body weight; pressure on the hind legs, 40-45%. Pressure on the right and left was distributed rather equally. Both in the quiet state and in the course of effecting local alimentary CR reactions, pressure on the diagonally located extremities changed, as a rule in 1 direction, and on the adjacent extremities oppositely. Mathematical analysis shows that such pressure distribution is necessary to maintain balance with minimal deviations of the center of gravity, which is somewhat to the fore of the geometric center.—*J. D. London.*

5915. Jensen, Glen D., Leung, Calvin M., & Hess, David T. (State University Coll. New York, Fredonia) **"Freeloading" in the Skinner box contrasted with freeloading in the runway.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 67-73.—Allowed 3 groups of naive male Sprague-Dawley rats to make either 0, 40, or 285 rewarded bar-pressing responses and then gave Ss a choice between eating pellets from a dish (freeloading) or pressing the bar. 3 independent groups (Ss randomly assigned) made either 0, 40, or 285 rewarded runs in a 4-ft runway, and then chose between freeloading in the start box or running the maze. For all 6 groups a "total time" score was obtained which reflected the average time taken to stop freeloading and perform either 1 bar-pressing response or 1 run to the goal box. The 3 runway groups showed a marked tendency toward higher total time scores with increasing amounts of training whereas the 3 Skinner-box groups showed a trend in the opposite direction.—*Journal abstract.*

5916. Krane, Richard V. & Ison, James R. (U. Rochester) **Positive induction in differential instrumental conditioning: Effect of extended acquisition training.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 334-340.—28 male albino rats received 50 or 160 differential conditioning trials followed by 30 extinction trials to the former positive stimulus (S+) in succession (control condition) or with each S+ preceded by a trial to negative stimulus (S-) (alternated positive induction—PI—condition). After 160 trials stimulus alternation provided more resistance to extinction of S+ than provided by the control condition, whereas after 50 trials the reverse was obtained. Prior reports indicate that PI obtained in

acquisition declines with overtraining; this contrast indicates that acquisition PI and extinction PI may have different theoretical determiners. Extinction PI may result because S- following overtraining prevents the accumulation of inhibition across successive trials to the former S+. (18 ref.)—*Journal abstract.*

5917. Manocha, Satinder N., Winocur, Gordon, & Mills, John A. (U. Saskatchewan, Saskatoon, Canada) **Interaction of fear effects with habit strength.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 462-466.—4 groups of male albino rats received 0, 3, 6, or 9 days of overtraining after having reached stable performance on a continuous reinforcement bar pressing schedule. $\frac{1}{2}$ the Ss in each group had previously been designated emotionally reactive or nonreactive in terms of defecation rates in an open-field test. Following training, there were 4 test days in which bar pressing in each group was examined in the presence or absence of white noise. It was found that, in both the reactive and nonreactive groups, white noise produced a fear reaction which significantly depressed bar pressing at low levels of habit strength while having an energizing effect at higher levels. Results support J. L. Bardach's hypothesis that anxiety introduced early in practice is more disruptive than when introduced late in practice.—*Journal abstract.*

5918. Neuringer, Allen J. (Foundation for Research on the Nervous System, Boston, Mass.) **Animals respond for food in the presence of free food.** *Science*, 1969(Oct), Vol. 166(3903), 399-401.—2 male white Carneaux pigeons pecked a response disk to gain access to grain rewards while identical grain was freely available from a cup within the experimental chamber. Similarly, 2 female albino rats pressed a lever for food pellets while free pellets were present. It is concluded, therefore, that it is not necessary to deprive an animal of food before it will engage in instrumental responding for food. Such responding can serve as its own motivation and reward.—*Journal abstract.*

5919. Popova, E. I. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Uslovnoreflektornye komponenty v funktsional'noi strukture dvigatel'nogo navyka.** [Conditioned reflex components in the functional structure of the motor habit.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 574-579.—Secured, in 4 dogs, the optimal appearance and stability of an alimentary-motor reflex through backward conditioning. Under study were (a) features of its manifestation, (b) dynamics of its extinction, and (c) state of the direct (forward) conditioned connection (movement → secretion) at various stages of extinction of the backward connection. Ss who had been amply trained to approach and maintain a cup of food presented at a distance, by flexing a foreleg attached to a lever, manifested this reaction needlessly when food was made directly accessible to them. It is shown that the frequency of redundant paw flexure grows with progress of the act of eating. Explanation of the findings in terms of the "law of effect," presumably by analogy with the basic principle of the servosystem, is held to be impossible. The findings may be viewed as constituting an optimal experimental model for demonstrating the motor effect by means of backward conditioning.—*I. D. London.*

5920. Pressman, Ya. M. & Tveritskaya, I. N. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **O kolichestvennoi kharakteristike sum-**

matsionnoi reaktsii. [On quantitative characteristics of the summated reaction.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 566-573.—Attempted to delineate the relationship between the summated reaction and the CR (or the relationship between associative and nonassociative factors) in the very course of elaborating the CR at various stages of its establishment. Serving as stimuli for 5 dogs were airpuffs directed at the cornea, and electrocutaneous stimulation of the hind leg, both separately applied at different times. The following recordings were made: a mechanogram of the blinking reaction and of paw movement, and an EMG of the gastrocnemius muscle of the stimulated paw. Summation is seen as expressed by the fact that, on application of only 1 of the stimuli, there arose, besides its own proper UCR, from time to time also a reaction, proper to the other stimulus. Quantitative estimates are given of summated reactions to both of the stimuli utilized (probability of appearance, statistical sequence of positive and negative outcomes, and distribution of latent periods). It is concluded that summational interaction, arising between nervous structures responsible for effecting UCRs to the stimuli utilized, is either circular of 2-way. The connection between structures is effected with some uncertainty by means of discrete signalization. The nonpaired application of the stimuli can produce an effect outwardly similar to a CR.—*I. D. London.*

5921. Pressman, Ya. M. & Tveritskaya, I. N. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Ob izmenenii skrytykh periodov bezuslovnykh reaktsii na signal'nyi i podkreplyayushchii raz-drazhiteli.** [On alteration of the latent periods of unconditioned reactions to signal and reinforcing stimuli.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(3), 395-403.—5 dogs were Ss used to study (a) the variability of the latent periods of the wink UCRs with simple repetition, in the beginning, of the same stimulus and afterwards with paired application of the stimuli (air-puff against the cornea and electrocutaneous stimulation of paw in different sequences) in forming the CR, and (b) the changes in the latent periods of the UCRs themselves, arising in response to both signal and reinforcing stimuli. Mechanograms and EMGs of the gastrocnemius muscle of the stimulated paw were recorded along with the wink reflex of the eyelid. Simple repetition of the same UCS led to stabilization of the values of the latent period and to diminution of their scatter. The paired application of 2 UCSs, so that 1 of them constantly preceded the other by 1.5 sec., produced a change in the values of the latent periods of the UCRs. The UCR to the stimulus, following the 1st stimulus, was facilitated and the average value of its latent period was significantly shortened; while the UCR to the preceding stimulus was subjected to inhibition and the average value of its latent period was significantly lengthened. With discontinuation of pairing of the 2 UCSs, the lengthened latent period of the UCR to the 1st stimulus (with respect to order of association) was gradually shortened. The possible significance of the data for the problem of closure of the conditioned connection is discussed.—*I. D. London.*

of Behavior, 1970(Nov), Vol. 14(3, Pt. 1), 341-343.—Describes the apparatus and provides detailed assembled and exploded views of the conditioning chamber.

5923. Stewart, Robert A., Miller, Alan R., Steele, Richard E., & Kiker, Vernon L. (California State Coll., Los Angeles) **Role of spatial variables in conditioned conflict.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 415-419.—Placed male Sprague-Dawley rats in conflict by pairing shock and feeding. Ss were randomly assigned to 4 groups: 8 satiated controls, 9 food deprived controls, 12 short-runway with conflict, and 12 long-runway with conflict. Stabilimeter scores indicate that runway length during training had persisting effects on activity levels. Subsequent deprivation produced differential stabilimeter activity in the absence of runway trials, which was taken as evidence for conditioned conflict elicited by drive stimuli. (16 ref.)—*Journal abstract.*

5924. Willis, Richard D. (U. Illinois) **Shock intensity, partial reinforcement, and experimental design effects in the acquisition of conditioned suppression.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 940-941.

5925. Zakher, Yu. Ya. (Inst. of Experimental Medicine, Leningrad, USSR) **O roli chisla uslovnykh razdrzhitelei pri posledovatel'nom ikh differentsirovani.** [On the role of the number of conditioned stimuli in their successive differentiation.] *Zhurnal Vysheĭ Nervnoĭ Deyatel'nosti*, 1969, Vol. 19(4), 704-706.—Ss were 2 male simians, a baboon (*Mandrillus sphinx*) and a capuchin (*Cebus capucinus*). CSs were a 64-mm diameter circle (positive), and a 90-mm diameter circle (negative differential), with the former followed by presentation of a lidded box with food and the latter by presentation of a lidded box invisibly locked. Regardless of the number of stimuli presented successively, a sharp predominance was noted of the "reflex to the absolute stimulus" (64-mm circle) over the "reflex to a relative stimulus" (e.g., 45-mm circle:64-mm circle).—*I. D. London.*

Discrimination

5926. Beale, I. L. (Dalhousie U., Halifax, Nova Scotia, Canada) **The effects of amount of training per reversal on successive reversals of a color discrimination.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 345-352.—Trained 3 groups of 3 experimentally naive homing pigeons each on a red-green discrimination in which the stimuli were alternately presented in a multiple schedule of reinforcement. The discrimination was reversed 24 times. Groups were given 1, 2, or 4 hr. of training on each discrimination. Increasing the length of training had 2 principal effects on reversal performance. It increased the rate of extinction of responding to 1 of the stimuli, and increased the rate of reacquisition of responding to the other. The latter effect involved both an increase in reacquisition of responding to a positive stimulus within reversals and an increase in recovery of responding to the previous negative stimulus between reversals. Improvements in performance of each group over the series of reversals were qualitatively similar to the 2 effects of length of training on each discrimination, and were analogous to effects obtained in other studies involving overtraining and successive reversals of simultaneous discriminations.—*Journal abstract.*

5927. Deets, Allyn C., Harlow, Harry F., & Blomquist,

Allen J. (U. Wisconsin, Primate Lab.) **Effects of intertrial interval and Trial 1 reward during acquisition of an object-discrimination learning set in monkeys.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 501-505.—Gave 10 female rhesus monkeys a series of 720 2-trial object-discrimination problems. Each problem involved presentation of 1 object on Trial 1, which was either rewarded or not rewarded, an ITI of 5, 10, or 20 sec., and presentation of the Trial 1 object along with a 2nd object on Trial 2. The ITI duration had no effect upon performance during the initial stages of training for object-discrimination learning set (ODLS), but an effect was apparent during the later stages of training, when Trial 2 performance decreased as a function of increased ITI. Better Trial 2 performance followed a nonrewarded Trial 1 response at all stages of ODLS acquisition, but the difference decreased during the later stages of training. The ITI duration and Trial 1 reward and nonreward did not interact to affect performance at any stage of ODLS acquisition. Findings are discussed in terms of D. W. Bessemer's short-term memory analysis of learning sets. (15 ref.)—*Journal abstract.*

5929. Fleming-Holland, Andree. (Arizona State U.) **Stimulus control as a function of degree of association between discriminative stimuli and reinforcement contingencies.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 412.

5930. Kinchla, Julaine. (Princeton U., Auditory Research Lab.) **Discrimination of two auditory durations by pigeons.** *Perception & Psychophysics*, 1970(Nov), Vol. 8(5-A), 299-307.—Investigated discrimination between 2 auditory durations in experimentally naive white Carneaux male pigeons with a procedure that provided a direct analogue to the conventional "yes-no" signal detection task with humans. In Exp. I with 7 Ss, development and maintenance of the discrimination using highly confusable durations was examined. Exp. II with 16 Ss investigated sequential effects in stationary performance. The effect of altering probability of reinforcement and extinction was also examined. Ss developed and maintained a partial discrimination. As separation between the 2 durations was reduced, discriminability was systematically decreased. Reduction of the probability of reinforcement produced changes similar to those exhibited by humans when pay-off functions are altered. The only sequential effect of any size was a tendency to repeat responses. Individual differences were considerable. (18 ref.)—*Journal abstract.*

5931. Lyons, Joseph. (U. Wisconsin, Milwaukee) **Stimulus generalization as a function of discrimination learning with and without errors.** *Science*, 1969(Jan), Vol. 163(3866), 490-491.—Tested 60 pigeons in 3 equal groups for generalization to the angularity (negative stimulus) dimension. For $\frac{1}{2}$ of each group, each angle was superimposed on a light of 555-nanometer wavelength, the positive stimulus during training; for the other $\frac{1}{2}$, angles were on a black background. When tested to the angularity alone, Ss who had made errors (pecked at the negative stimulus) during discrimination training showed a typical incremental

(inverted) gradient of responding to the negative stimulus dimension. Controls and the group learning the discrimination without errors showed no differential control by the negative stimulus dimension. When each angle was superimposed on the positive stimulus during testing, a decremental gradient with maximum response strength to the negative stimulus was evidenced by the 2 groups learning with and the one learning without errors.—*Journal abstract.*

5932. Waller, T. Gary. (U. Waterloo, Ontario, Canada) **Effect of irrelevant cues on discrimination acquisition and transfer in rats.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 477-480.—To examine the effects of irrelevant cues on simultaneous discrimination learning, 40 naive male albino Holtzman rats (5 groups of 8 Ss each) were 1st trained on a brightness discrimination with texture cues either relevant, constant irrelevant, variable-between irrelevant, or variable-within irrelevant. Subsequently, Ss were transferred to a texture discrimination with brightness cues held constant. Ss trained with variable-irrelevant texture cues learned both the brightness and texture discriminations more slowly than Ss trained without the variable texture cues, and learned the texture discrimination more slowly than controls not trained on the brightness discrimination.—*Journal abstract.*

5933. Winefield, A. H. & Jeeves, M. A. (U. Adelaide, South Australia) **The effect of position training on brightness discrimination in the rat.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 301-309.—Investigated the effects of manipulating position preferences on the subsequent learning of a visual discrimination in 2 experiments with 24 naive Wistar hooded male rats each. In Exp. I the visual cues were absent during the position training; in Exp. II the visual cues were present but irrelevant to reward during the position training. In neither experiment did position training produce subsequent differences in rates of visual discrimination learning between experimental and control groups. Ss in both groups learned much more slowly in the 2nd experiment than in the 1st.—*Journal abstract.*

5934. Zentall, Thomas R. (U. Pittsburgh) **Effects of context change on forgetting in rats.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 440-448.—Tests of interference theory involving prior learning interference (PI) and later learning interference (RI) paradigms with animal Ss generally attribute observed forgetting to the loss of an association. Since no instructions are given at the time of recall, forgetting may be due to response dominance. To assess the effect of instructions on forgetting in rats, 132 male pigmented Long-Evans rats learned 2 tasks, each in a different context. During the retention test, either the Task 1 context (RI Ss) or the Task 2 context (PI Ss) was reinstated. 4 groups were run for each paradigm: large change in context, small change in context, no change in context, and a single-task control. $\frac{1}{2}$ of each group were tested after retention intervals of 1 and 40 days. The change in context effect was significant for the RI Ss but not for the PI Ss, due to a floor effect. It is concluded that specific cues during training can reduce and perhaps even eliminate forgetting. (21 ref.)—*Journal abstract.*

Avoidance & Escape

5935. Abrams, Charles. (Syracuse U.) **Excitation and inhibition: Dual effects of differential conditioning manifested in the acquisition of a fear-based re-**

sponse and some implications for proper control measures. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 404-405.

5936. Blackman, D. E. (U. Nottingham, England) **Conditioned suppression of avoidance behaviour in rats.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 547-553.—Exposed 6 male rats to schedules of free-operant shock avoidance. For 3 Ss, auditory or visual stimuli were present continuously throughout each experimental session. For the remaining 3 Ss, these stimuli were presented only 5 sec. before an avoidable shock, and were removed by any operant response to be emitted during their presence. For these latter Ss, the stimuli developed strong discriminative control over the emission of operant responses. When the avoidance behavior had stabilized, the effects were studied of a stimulus which preceded an unavoidable shock of the same intensity as that maintaining the avoidance responding. These effects were studied in the following conditions: (a) against the ongoing avoidance behavior, (b) with no avoidance stimuli present, and (c) against extinction of avoidance behavior. With Ss exposed to continuous schedule stimuli, all these conditions resulted in an acceleration of responding during the signal which preceded an unavoidable shock. Ss with the strong stimulus control of avoidance responding afforded by the discontinuous schedule stimuli never showed such an acceleration; indeed, all 3 Ss showed suppression of their operant responding in the final experimental condition. It is concluded that experience of shock avoidance per se is not sufficient to produce the acceleration effect: the discriminative control of behavior, or lack of it, is also implicated.—*Journal abstract.*

5937. Bovet, Daniel; Renzi, Paolo, & Oliverio, Alberto. (U. Sassari, Italy) **Transfer of responding between different stimuli in rats trained in two avoidance tasks.** *Life Sciences*, 1969(Jun), Vol. 8(12, Pt. 2), 575-582.—Assessed transfer of responding between stimuli in different sensory modalities in rats subjected to shuttle- and Skinner-box avoidance learning. Results show that in Ss trained in a shuttlebox no transfer of responding was evident when the Ss were shifted from a steady tone to a steady light while a clear transfer occurred when Ss were given a short experience of the new stimulus (light) in association with the old one (tone) or when stimuli of the same repetition rate were adopted (pulsed tone or pulsed light). On the contrary a direct positive transfer from a steady tone to a steady light was evident in Skinner-box avoidance responding. Thus, the occurrence of transfer in 2 different avoidance procedures based on the same aversive UCS and on similar CS depends on the task adopted.—*Journal summary.*

5938. Elder, S. Thomas; Kuehne, Thomas E., Clark, Nathan, & Larre, Earl E. (Louisiana State U., New Orleans) **Approach-avoidance conflict: I. Empirically determined speed-of-locomotion approach gradients.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 623-628.—Trained 16 naive Sprague-Dawley male rats to approach the distinctive end of a 20-ft runway for a 25% sucrose solution. Their running speed was determined over successive 6-ft segments of the maze. After 5 days of 5 training trials/day, quinine was substituted for sucrose in the case of $\frac{1}{2}$ the Ss and the remaining 8 Ss were run under conditions of extinction. Analysis of the intersegmental speeds over the 5 days of training showed the approach speed-of-locomotion gradient was composed of a linear and a quadratic component. Comparison of the quinine and extinction treated groups over

Days 6 and 7 suggested quinine was adequate to establish an approach-avoidance conflict in Ss previously trained to approach for a positive incentive, and from which recovery was fairly rapid.—*Journal abstract.*

5939. Elder, S. Thomas; Kuehne, Thomas E., & Moriarty, Daniel D. (Louisiana State U., New Orleans) **Approach-avoidance conflict: II. Role of olfactory cues.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 631-638.—Employed 24 naive hooded rats in a 2×2 factorial comparison of anosmic vs. nonanosmic and obstruction vs. nonobstruction conditions. Comparisons were made in terms of speed-of-locomotion toward a goal area. After all Ss had received a series of successive reinforced approach-training trials, several untrained Ss were placed in the goal box and subjected to foot shock. 9 min. later the shocked Ss were removed, and previously designated groups of trained Ss were given additional approach trials. A nonshocked group of untrained Ss was placed in the maze and removed after 9 min. as the nonobstruction condition. Thus anosmic and sham-operated Ss were compared before and after untrained Ss occupied the goal box. Analysis of speed-of-locomotion scores show the nonanosmic group had a significant reduction in speed-of-approach following occupancy by the shocked untrained Ss. None of the other 3 groups showed a similar change in the previously established speed-of-approach. From these and other data, it appears unshocked Ss respond differently to olfactory cues generated by the previous occupancy of shocked and nonshocked Ss.—*Journal abstract.*

5940. Feigley, David A. & Spear, Norman E. (Rutgers State U.) **Effect of age and punishment condition on long-term retention by the rat of active- and passive-avoidance learning.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 515-526.—Tested retention of avoidance learning in weanling and adult Sprague-Dawley rats ($N = 121$ and 96) after 1 or 28 days. Punishment severity was varied in both 1-way active- and passive-avoidance tasks. Active-avoidance learning rates did not differ for weanlings and adults, both learning faster the more severe the punishment. Passive avoidance was also learned faster by both as punishment severity increased, but the weanlings' acquisition rate appeared related to the size of the apparatus relative to S's body size. Retention loss between 1 and 28 days was greater for weanlings than adults for both tasks. Rate and degree of original learning, effective shock intensity, and 1 source of growth-induced generalization decrement were dismissed as indirect determinants of the greater forgetting by younger Ss. (22 ref.)—*Journal abstract.*

5941. Olliverio, Alberto. (U. Sassari, Italy) **Transfer of avoidance learning in different strains of inbred mice.** *Life Sciences*, 1968(Nov), Vol. 7(22, Pt. 2), 1157-1162.—Assessed transfer of learning in different strains of inbred mice trained in a shuttlebox. The transfer was evident when Ss previously trained to respond to a given stimulus were subjected to a session in which a new stimulus was used. The occurrence of transfer was dependent on a training session during which Ss were given an experience of a compound CS formed by a combination of the already known and the new stimulus. The importance of the genetic traits in determining the extent of the presence of the transfer was evident.—*Journal summary.*

5942. Potts, W. Joseph. (G. D. Searle & Co., Chicago, Ill.) **Avoidance learning in the rat as a function of strain differences.** *Psychological Reports*, 1970(Aug),

Vol. 27(1), 235-243.—Tested 264 Wistar, Sprague-Dawley, and Fischer rats for general activity levels and for 3 different types of avoidance learning. No strain differences were observed for general activity or for the number of trials to learn a conditioned avoidance response (CAR) in the 1-way shuttle box. The Fischer strain avoided shock more than the Wistar strain which in turn avoided shock more than the Sprague-Dawley strain during the acquisition of the CAR and non-discriminated avoidance response in the 2-way shuttle box. (20 ref.)—*Journal abstract.*

5943. Powell, Robert W. (U. South Florida) **The effect of shock intensity upon responding under a multiple-avoidance schedule.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 321-329.—Studied the effect of 2 shock intensities (1 and 2 ma) in the acquisition, maintenance, and extinction of unsignaled avoidance by 12 naive male albino rats. Single and multiple avoidance schedules were employed, with shock intensity being the principal condition that differed between schedule components. The higher shock intensity was generally more effective in producing avoidance. Higher response rates and lower shock rates were observed under high-intensity shock when performance stabilized. When the multiple schedule was introduced, the 6 Ss trained under a single shock intensity all showed poorer performance under the new shock intensity, whether it was higher or lower than the training intensity. Performance under the original shock intensity did not change substantially with the introduction of a different shock intensity in the other multiple schedule component. Performance under the new shock intensity showed gradual improvement with continued exposure to it. All of the Ss showed persistent "warm-up," receiving approximately 40% of the total session shocks in the 1st $\frac{1}{4}$ of the session. The degree of warm-up was unrelated to avoidance shock intensity. (25 ref.)—*Journal abstract.*

5944. Riess, Dave. (Galesburg State Research Hosp., Ill.) **Sidman avoidance in rats as a function of shock intensity and duration.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 481-485.—4 mature male albino rats with extensive avoidance experience were run in a Skinner box through a randomized series of 5 shock intensities beginning at .25 ma. and increasing geometrically by multiples of 2. The functional relationship for response rates resulting was positive and monotonic throughout, but the sensitivity of the response and shock rates was largely exhausted in the .25-1 ma. range, with further intensity increases up to 4 ma. producing only negligible increases in response rate. Duration was manipulated for 5 values of .05, .1, .15, .2, and .3 sec. with intensity at .5 ma. A nearly identical monotonic function emerged except that the slope was less precipitous and greater sensitivity was evident at the larger duration values. (17 ref.)—*Journal abstract.*

5945. Roberts, A. E. & Hurwitz, Harry M. (Catawba Coll.) **The effect of a pre-shock signal on a free-operant avoidance response.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 331-340.—Trained 9 experimentally naive female hooded rats in free-operant avoidance. After 25 training sessions, a 1-min signal followed by a brief shock was presented on the average of once every 4 min. During the signal, the avoidance schedule was suspended (20 sessions). Response rates during the signal were markedly reduced. Shock rates during nonsignaled periods increased. 15 additional sessions were given during

which the signal was presented without shock. Response rates during signaled periods were greater than previously observed during signaled periods, indicating that signaled shock had suppressive control over a previously acquired avoidance response rate. (17 ref.)—*Journal abstract*.

5946. Sansone, Mario & Bovet, Daniel. (Consiglio Nazionale Delle Ricerche, Rome, Italy) **Avoidance learning by guinea pigs.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 458-461.—Trained 3 groups of 8 male albino guinea pigs in shuttle-box avoidance conditioning. Superior performances were achieved with longer CS-UCS (15 sec. against 5 sec.) and ITIs (90 sec. against 30 sec.). There were no performance increments within sessions, but improvements in performance occurred between sessions. Consolidation mechanisms probably play an important part in avoidance learning by guinea pigs.—*Journal abstract*.

Reinforcement

5947. Fillon, Ross D., Fowler, Stephen C., & Notterman, J. M. (U. Pennsylvania, Medical School) **Effort expenditure during proportionally reinforced responding.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 398-405.—Performed a bar-pressing experiment in which 6 male Sprague-Dawley laboratory rats were reinforced approximately in direct proportion to the level of time integral of force ("effort") exerted/response. Over the course of training, Ss increased in efficiency, as measured by amount of food obtained/unit effort exerted. It was not demonstrated, however, that Ss learned to take advantage of the effort-proportional reinforcement contingency.—*Journal abstract*.

5948. Fillon, Ross D., Fowler, Stephen C., & Notterman, J. M. (U. Pennsylvania, Medical School) **Some effects of prefeeding and training upon rate and precision of bar-pressing response.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 328-333.—Prefed 3 groups of 7 male Wistar rats each different amounts of food. The concurrent effects upon precision of response (force discrimination) and upon rate of responding were observed. These appear to be opposing curvilinear functions of amount prefed, the consequence of which is to yield relatively uniform reinforcement rate. (22 ref.)—*Journal abstract*.

5949. Halford, G. S. & Halford, Joan M. (U. Newcastle, New South Wales, Australia) **Secondary reinforcement: Signal or substitute reward? A preliminary investigation.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 145-147.—Studied the effect of an uninformative tone on the bar-pressing behavior of 30 female hooded rats to see whether a secondary reinforcer had any role beyond that of signal of a forthcoming reward. A tone was sounded for 1 sec. immediately following each bar press by the experimental group. After a delay, 50% of bar presses were followed by a food pellet, which was preceded by a 2nd occurrence of the tone. There was a control group which received the tone only before food and another which received the tone only after response. The experimental group performed at the same level as the group which had tone before food only. It is concluded that a stimulus is not necessarily prevented from acquiring secondary reinforcement value by being uninformative with respect to the outcome of a response.—*Journal abstract*.

5950. Hineline, Phillip N. (Temple U.) **Negative reinforcement without shock reduction.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 259-268.—Reliably produced stable lever-press responding in 16 naive brown Lasley rats and maintained it by a procedure in which responses could delay shocks without affecting overall shock frequency. Responding was not maintained when the delay-of-shock involved an increase in overall shock frequency. (21 ref.)—*Journal abstract*.

5951. Mackintosh, N. J. (Dalhousie U., Halifax, Nova Scotia, Canada) **Distribution of trials and the partial reinforcement effect in the rat.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 341-348.—Spacing of trials decreased the magnitude of the PRE by increasing resistance to extinction in consistently reinforced naive male hooded rats (N = 36) and decreasing resistance to extinction in partially reinforced Ss. Exp. II with 40 Ss showed that variation in a single ITI (that separating nonreinforced from succeeding reinforced trials) was sufficient to produce this effect. The suggestion that these results were due to forgetting of the aftereffects of nonreinforcement is supported by Exp. III with 40 Ss which shows that the results depended upon the opportunity for aftereffects of preceding reinforcements to interfere with and hence cause forgetting of the aftereffects of nonreinforcement. (25 ref.)—*Journal abstract*.

5952. Prytula, Robert E. & Braud, William G. (Middle Tennessee State U.) **Sucrose-pellet incentive shifts in the double alley.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 391-397.—4 groups of male albino Cheek-Houston rats were given 45 double runway trials under the following conditions: (a) nonreward in goal box (GB) throughout, (b) nonreward in GB for 30 trials followed by an upshift in 2 97-mg sucrose pellets for 15 trials, (c) 2 97-mg sucrose pellets in GB, throughout, or (d) 2 97-mg sucrose pellets for 30 trials followed by a GB, downshift to nonreward for 15 trials. Sucrose incentive upshift produced a rapid Runway 1 start speed increment, while the downshift in sucrose had little or no effect on this measure. Runway 1 run and goal measures and all measures of Runway 2 performance seemed little affected by GB, incentive magnitude, in that all groups converged toward a common asymptote.—*Journal abstract*.

5953. Ten Eyck, Robert L. (Larue D. Carter Memorial Hosp., Indianapolis, Ind.) **Effects of rate of reinforcement-time upon concurrent operant performance.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 269-274.—Conducted 3 experiments to investigate the theoretical reduction of rate and duration of reinforcement to their product, rate of reinforcement time, under concurrent chain schedules. In Exp. I, rate of reinforcement time was varied by varying rate of reinforcement delivery, holding duration of reinforcement availability constant. In Exp. II, rate of reinforcement time was varied by holding rate of reinforcement delivery constant and varying duration of reinforcement availability. In Exp. III, rate of reinforcement time was held constant by varying both rate and duration of reinforcement simultaneously and inversely. 3 adult white Carneaux pigeons served in each experiment (total N=9). The procedure consisted of 2 states, an initial choice link and a terminal reinforcement link, which alternated regularly. For all 3 experiments, both relative rate of responding and relative

time spent in the initial link matched approximately the relative rate of reinforcement. time arranged in the terminal link. Data are interpreted as supporting the notion that rate and duration of reinforcement may be functionally equivalent and reducible to a single variable, rate of reinforcement time.—*Journal abstract.*

Reinforcement Schedule

5954. Blackman, Derek. (U. Nottingham, England) **Effects of a pre-shock stimulus on temporal control of behavior.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 313-319.—Exposed 6 naive male Wistar albino rats to a situation in which a response on Lever B was followed by reinforcement if a preceding response on Lever A had been made at least 5, 10, or 15 sec. before. The effects of signaled unavoidable shock were studied on the behavior maintained by this procedure. All Ss made fewer A-to-B sequences during the periods of preshock stimulus. When the A-to-B delay was 10 or 15 sec., the distribution of A-to-B times changed, there being more shorter intervals. However, for Ss where the A-to-B delay was 5 sec., the distribution of A-to-B times was not changed during the preshock stimulus. In all cases, there was an increased proportion of inappropriate B responses (i.e., with no preceding A response) during the preshock stimulus; this was most marked with Ss exposed to a 15-sec A-to-B delay.—*Journal abstract.*
5955. Bloomfield, T. M. & Russell, D. G. (York U., Toronto, Ontario, Canada) **Behavioural contrast and preference in a double chained schedule.** *Quarterly Journal of Experimental Psychology*, 1970(Aug), Vol. 22(3), 368-373.—Pigeons peck faster during a signal for reward (S+) when that signal alternates with 1 for absence of reward (S-). This contrast effect has been shown to involve diminished preference for S+ compared with a stimulus not involved in a discrimination. It is demonstrated that the signal produced by pecks to S+ in a chained schedule is responded to in proportion to the contrast effect during S+. The result suggests that a prior interpretation of contrast, in terms of Amsel's frustration theory, is not the correct one.—*Journal abstract.*
5956. Cherek, D. R. & Pickens, Roy. (U. Minnesota) **Schedule-induced aggression as a function of fixed-ratio value.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 309-311.—Pigeons responding for food on fixed-ratio reinforcement schedules attacked live target birds when the ratio value was increased, but not when the value was decreased. Ss were 4 experimentally naive male Nun pigeons, 2 as experimental Ss and 2 as targets. The frequency of attacks peaked several days after ratio value change, and then gradually decreased to an original level.—*Journal abstract.*
5957. Edwards, Diane D., Peek, Vickie, & Wolfe, Frank. (U. Missouri, Kansas City) **Independently delivered food decelerates fixed-ratio rates.** *Journal of the Experimental Analysis of Behavior*, 1970(Nov), Vol. 14(3, Pt. 1), 301-307.—Scheduled, following fixed-ratio base lines, the independent delivery of reinforcers alone or concomitant with the fixed-ratio schedule for all Ss. 5 rats served as Ss. Systematic manipulations of either the interreinforcement interval or the ratio size were also made during concomitant schedules. Response rates during the independent delivery of reinforcers did not decelerate until the Ss had been exposed for 50 or more sessions. Rate decelerated after a few sessions when the interreinforcement intervals were less than $\frac{1}{2}$ of the original value and scheduled along with the ratio dependency. When both schedules were available, reductions in the ratio size resulted in slight deceleration of response rate when compared with the level of deceleration yielded by reductions in the independent reinforcement intervals.—*Journal abstract.*
5958. Frazier, James R. (U. North Carolina, Child Development Inst.) **Effects of constant delay of reinforcement on wheel running.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 247-250.—3 groups of 4 adult female Sprague-Dawley albino rats completed run-to-lick contingencies with delay of reward intervals of 0, 3, and 10 sec. imposed between the fixed ratio 10 running requirement and delivery of a 4% sucrose solution. Following acquisition sessions, Ss received extinction sessions which continued until instrumental responding stabilized. The experimental design continued over 4 replications. There were no differential effects of delay of reward conditions on either total acquisition or extinction responding.—*Journal abstract.*
5959. Gavelek, James R. & McHose, James H. (Washington State U.) **Contrast effects in differential delay of reward conditioning.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 454-457.—50 naive male albino Holtzman rats received differential conditioning training with differential delay of reward, correlated with alley brightness. Groups were designated according to the delay, in seconds, received prior to reward in the short-plus (S+) and long-minus (S-) delay alleys, respectively: Groups 1-1, 1-10, 1-30, 10-30, and 30-30. The performance levels of differentially reinforced Ss to both S+ and S- were depressed relative to the performance levels of nondiscrimination control Ss. Results are discussed as consistent in all respects with the effects of differential reward amount and percentage conditioning.—*Journal abstract.*
5960. Rudy, Jerry W. & Homzie, M. J. (Yale U.) **Within-subjects partial reinforcement with rats: Sequence and discriminability of reinforcement events.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 465-469.—In a within-Ss partial reinforcement experiment, acquisition training was administered such that following nonrewarded trials 43 naive male Long-Evans rats received reward (a) only in the continuously reinforced runway or (b) only in the partially reinforced (PRF) alley. $\frac{1}{2}$ of the Ss in each of these conditions were presented an external stimulus which permitted these Ss to anticipate the reinforced and nonreinforced trials in the PRF alley. The extinction performance of Ss in Condition a was inferior to that of Ss in Condition b. Ss not permitted to discriminate the reinforcement events exhibited better extinction performance than Ss which could make this differentiation. Implications of these findings for within-Ss experiments and for a sequential interpretation of extinction performance are discussed.—*Journal abstract.*
5961. Smith, Judith M. (Arizona State U.) **Self-imposed blackouts during variable interval- and multiple variable interval-extinction reinforcement schedules.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 427.
5962. Zeiler, Michael D. (Emory U.) **Time limits for completing fixed ratios.** *Journal of the Experimental*

Analysis of Behavior, 1970(Nov), Vol. 14(3, Pt. 1), 275-286.—Investigated how the addition of time limits affected fixed-ratio behavior. In Exp. I, 4 white Carneaux pigeons obtained food only if they completed the ratio within a specified time after the end of the preceding ratio. In Exp. II, they obtained food only if they took longer than a specified time. Failures to meet the time criteria produced brief timeouts. The times taken depended on the requirements in both experiments. In Exp. I, progressively briefer time criteria resulted in faster ratios, and in Exp. II, longer time criteria increased the time taken in each ratio. Ss sensitivity to the temporal variable, a property of the entire period extending from the 1st opportunity to respond to the end of the ratio, indicate that performance involved a behavioral unit encompassing both the postreinforcement pause and the responses comprising the ratio. (19 ref.)—*Journal abstract*.

Punishment & Extinction

5963. Barnes, W. & Tombaugh, T. N. (Carleton U., Ottawa, Ontario, Canada) **Effects of sucrose rewards on the overtraining extinction effect.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 355-359.—Studied the effects of sucrose concentration and number of acquisition trials on performance of 48 naive albino Sprague-Dawley rats in a discrete-trial (retractable bar) situation. 3 levels of bar-press training (120, 360, and 720 trials) were factorially combined with 2 sucrose concentrations (8 and 64%). Results show that extinction performance was an increasing function of sucrose concentration and a nonmonotonic function, increasing to 360 trials and then decreasing, of the number of acquisition trials. No interaction between the variables was observed. Findings are discussed in relation to the Amsel-Spence behavior theory. (21 ref.)—*Journal abstract*.

5964. Padilla, Amado M. & Spanier, Douglas. (State University Coll. New York, Potsdam) **Role of multiple-pellet rewards in acquisition and extinction of a runway response.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 31-35.—Gave continuous reinforcement training to 4 groups of 10 naive male hooded rats in a straight runway. All Ss received 100 pellet rewards, but groups differed in number of locomotor responses, goalbox placements, and number of pellets received on each trial. Following acquisition, Ss in each of the main groups were given massed or distributed extinction training. Results show that Ss required to make a greater number of locomotor responses had faster terminal acquisition speeds and were more resistant to extinction. Results are discussed in terms of the A. Amsel, J. J. Hug, and C. T. Surridge multiple-pellet reward hypothesis. —*Journal abstract*.

SOCIAL & SEXUAL BEHAVIOR

5965. Anderson, Raymond K. (U. Wisconsin) **Mating and interspecific behavior of greater prairie chicken.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 953-954.

5966. Harper, Lawrence V. (U. California, Davis) **Role of contact and sound in eliciting filial responses and development of social attachments in domestic guinea pigs.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 427-

435.—Investigated the effects of delayed exposure, auditory, and tactual cues on filial responsiveness, and attachment behavior in 69 guinea pigs using pups which had been isolated at birth. Exposure to a furry moving calling model over Postpartum Days 1-3 was sufficient for the object's reinforcing maze-running behavior on Days 8-9. Sound increased the frequency of model contact; surface texture extended the duration of contact. Delaying initial exposure to models until Day 4, or to mother until Day 9, did not diminish social responsiveness, but early rearing with mother inhibited responsiveness to models. Model-exposed Ss responded to the model despite 7 days' subsequent experience with mother. A relationship between a species' ecology and the social significance of conspecific stimulus dimensions is suggested. (21 ref.)—*Journal abstract*.

5967. Le Bocuf, Burney J. & Peterson, Richard S. (University of California, Santa Cruz) **Social status and mating activity in elephant seals.** *Science*, 1969(Jan), Vol. 163(3862), 91-93.—Observed that individually marked male elephant seals, *Mirounga angustirostris*, participated in a social hierarchy resembling the peck order of domestic chickens. Individuals achieved status by fighting and maintained it by stereotyped threat displays. The higher the status of a male, the more readily he approached and copulated with females. 4% of the males inseminated 85% of the females.—*Journal abstract*.

5968. Pfaff, Donald. (Rockefeller U.) **Nature of sex hormone effects on rat sex behavior: Specificity of effects and individual patterns of response.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 349-358.—Estradiol injections reproduced part of the testosterone effect on masculine sex behavior in both 11 castrated male and 11 ovariectomized female Sprague-Dawley rats. Testosterone injections alone were not effective in stimulating feminine sex behavior, but testosterone + progesterone reproduced part of the estradiol effect on feminine behavior in female rats. The male or female Ss showing the most vigorous masculine behavior under 1 effective hormone condition also tended to respond most vigorously under other hormone conditions. Those Ss showing the most feminine behavior under 1 hormone condition also tended to do so under other hormone conditions. However, there was no significant relationship between an individual S's levels of masculine and feminine behavior either among the males or among the female rats. (29 ref.)—*Journal abstract*.

5969. Sachs, Benjamin D. & Barfield, Ronald J. (U. Connecticut) **Temporal patterning of sexual behavior in the male rat.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 359-364.—Described the copulatory behavior of 14 male Sprague-Dawley rats in terms of mount bouts, clusters of closely spaced attempts at mounting females, separated by periods free of mounting attempts. Measures based on mount bouts make possible meaningful temporal analyses of copulatory tests in which penile insertions (intromissions) do not occur during every mount bout. These measures were used to analyze the role of intromissions in governing the temporal patterning of the male's copulatory attempts. Prevention of intromission did not change the intervals between mount bouts significantly. Termination of mount bouts does not depend on intromission, and mounts without intromission strongly influence the timing of copulatory attempts. The tem-

poral organization of mount bouts suggests that they might be basic units in the male's sexual behavior.—*Journal abstract.*

5970. Wechkin, Stanley. (State University Coll. New York, Brockport) **Social relationships and social facilitation of object manipulation in Macaca mulatta.** *Journal of Comparative & Physiological Psychology*, 1970(Dec), Vol. 73(3), 456-460.—Investigated the role of O-demonstrator relationships in social facilitation of object manipulation among 18 adult and 12 juvenile rhesus macaques, using the duplicate cage method. It was found that such social facilitation occurred when the O was familiar with the demonstrator and was not affected by differences in dominance status, sex, or age relationships. Findings are in accord with theories of imitation which emphasize prior interanimal relationships, and, particularly, J. P. Scott's theory of allelomimetic behavior.—*Journal abstract.*

SENSORY PROCESSES

5971. Clopton, Ben M. (U. Washington) **Behavioral and neural aspects of increment detection by monkeys for the intensity of wide-band Gaussian noise.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 540.

5972. Fay, Richard R. (Princeton U., Auditory Research Lab.) **Auditory frequency discrimination in the goldfish (*Carassius auratus*).** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 175-180.—Determined auditory frequency-difference thresholds for 4 goldfish at 50, 100, 200, 400, 600, 800, and 1000 Hz. by a classically conditioned respiratory suppression technique. The difference thresholds increased monotonically from 3.5 Hz. at 50 Hz. to 47 Hz. at 1000 Hz. Although man is about 1 order of magnitude more sensitive in discriminating frequency, the slopes of the frequency-threshold functions for man and fish are identical up to 400 Hz. Above 400 Hz., discrimination ability declines for the goldfish relative to man, because of a frequency-doubling effect in the goldfish's auditory nerve fibers. The mechanisms for frequency analysis are similar in man and fish, at least for frequencies below 1000 Hz.—*Journal abstract.*

5973. Hein, Alan; Gower, Ellen C., & Diamond, Rhea M. (Massachusetts Inst. of Technology) **Exposure requirements for developing the triggered component of the visual-placing response.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 188-192.—Certain visually controlled movements develop only when a kitten (N = 15, 9, and 14) is exposed in light. Visually triggered extension of the forelimbs is not shown when the dark-reared S is 1st tested. Stimulation by light, even if restricted to periods of total immobilization, or with diffusers in front of the eyes, or under stroboscopic illumination, is sufficient for acquisition of the extension response. Visually guided behaviors do not develop under these exposure conditions. Motor-visual feedback, while essential for development of visually guided behaviors, is not required for acquisition of visually triggered extension.—*Journal abstract.*

5974. Hein, Alan; Held, Richard, & Gower, Ellen C. (Massachusetts Inst. of Technology) **Development and segmentation of visually controlled movement by selective exposure during rearing.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2),

181-187.—Attempts to clarify the role of movement-produced changes in visual stimulation for the acquisition of visually controlled behaviors. Exp. I shows that exposure during passive transport, which provides an asystematic relation between self-produced movements and visual stimulation, delays the acquisition of visual-motor coordination when a kitten is subsequently free to locomote in light. Exp. II demonstrates that control of movement by 1 eye develops if that eye is exposed during locomotion. This eye does not transfer to the contralateral eye which is exposed only during passive transport. In Exp. III, view of the forelimbs is restricted to 1 eye. Visually guided reaching develops under the control of that eye but does not transfer to the eye which has not viewed the limbs. Results of Exp. II and III provide evidence that the system for visual guidance of movement consists of components which can be acquired independently. (18 ref.)—*Journal abstract.*

5975. Johnson, D. L. & Wenner, A. M. (U.S. Air Force Academy, Colo.) **Recruitment efficiency in honeybees: Studies on the role of olfaction.** *Journal of Apicultural Research*, 1970, Vol. 9(1), 13-18.—Measurements were made on the activities of worker honeybees (*Apis mellifera*) which attended waggle dances by marked foragers in an observation hive, and on the success of unmarked recruits in finding a food source in the field. Potential recruits attended waggle dances for about 7 straight runs and then most of these bees left the hive within 1 min. When unscented sucrose was provided at the food site, few unmarked bees reached that source. When scent was added to the food, recruitment efficiency was improved. Numbers of unmarked foragers reaching the source varied directly with the amount of scent provided. Recruitment efficiency was also greatly influenced by alteration of the natural odor in the vicinity of a food source, whereas the numbers of unmarked foragers reaching the control site remained unchanged. These data are not consistent with the classic dance language hypothesis of honeybee communication, but do indicate that recruited foragers use olfaction in locating a food source. The greater the odor concentration at the food source the less difficult it is to locate a site by means of olfaction.—*W. E. Wood.*

5976. Smith, Lars. (U. Oslo, Norway) **Eye dominance in a monkey.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 657-658.—Developed a technique of examining eye dominance in rhesus monkey. 1 S was tested in binocular viewing conditions which were conflicting due to the method of previous training. Left-eye dominance was demonstrated in this S, who also preferred to use its left hand when working a lever.—*Journal abstract.*

constancy at various age-levels. *Journal of American Psychology*, 1970(Sep), Vol. 83(3), 372-376.—Ss viewed white disks (3, 6, 12, and 24 in. in diameter) at a distance of 25, 50, 100, and 200 ft., respectively. The visual angle subtended by each test object was constant at .57°. 18 5-12 yr. old children and 6 undergraduates formed 4 age groups of 6 Ss each with an additional 18 children and 6 undergraduates comprising 4 control groups. Separation slightly reduced the tendency toward size constancy at the longer distances. Data support the assumption that size constancy and the Ponzo illusion share common mechanisms, since the developmental size-distance function is independent of whether the comparison is successive, as in most size-constancy experiments, or simultaneous, as in the Ponzo illusion.—*Journal abstract*.

5988. Laverde Rubio, Eduardo; Castro de Wolff, Marina; Mojica, Leonor, & Sabogal, Fanny. (National U., Bogotá, Colombia) **Una institución privada de pro-**

tección infantil en Bogotá. [A private childhood protection institution in Bogotá.] *Revista de Psicología*, 1967, Vol. 12(1-2), 69-74.—Descriptive statistics concerning background, intelligence, and personality adjustment are given for 62 of the approximately 170 4-18 yr. old children who are inmates in an institution for orphans and children from broken homes. About 74% of the children have emotional problems, and an additional 18% are mentally deficient.—*L. Zusne*.

5989. Lieberman, Lewis R. (Charles L. Mix Memorial Fund, Americus, Ga.) **Life satisfaction in the young and the old**. *Psychological Reports*, 1970(Aug), Vol. 27(1), 75-79.—Administered the Life Satisfaction Index A (LSIA) to a group of 101 elderly persons (M age = 77.6) and a group of 78 undergraduates (M age = 20.1). The mean LSIA score of approximately 12 for both groups indicates no difference in degree of life satisfaction. An analysis of the responses of both groups to each of the 20 items of the LSIA, however, shows significant differences in the sources of satisfaction for each group. The old seemed more satisfied with their past, while the young seemed more apprehensive about the present and more optimistic about the future. The following hypothesis is offered: Life satisfaction, rather than being merely a reflection of a person's current level of goal achievement, is more like a set or orientation to one's environment which is acquired fairly early and remains moderately stable throughout life.—*Journal abstract*.

5990. Neimark, Edith D. & Slotnick, Nan S. (Douglass Coll., Rutgers State U.) **Development of the understanding of logical connectives**. *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 451-460.—Administered a 16-item test of logical connectives to 455 3rd-9th graders and to 58 undergraduates to assess their understanding of class inclusion and exclusion, class intersection and class union. 1/2 of the groups received a test in which set elements were pictures; for the other 1/2, elements were words. Although there was a significant grade main effect for all 3 types of questions: (a) inclusion and exclusion are understood by a majority of even the youngest Ss, (b) intersect is understood by a majority of all but the youngest Ss, and (c) union is not understood by the majority of Ss except at the college level. Data are discussed in light of related evidence, and an information processing account is proposed to account for the findings.—*Journal abstract*.

5991. Smothergill, Daniel W., Martin, Richard, & Pick, Herbert L. (Syracuse U.) **Perceptual-motor performance under rotation of the central field**. *Journal of Experimental Psychology*, 1971(Jan), Vol. 87(1), 64-70.—Reports 3 experiments on performance of simple eye-hand tasks under rotation of the central field of view. Rotation was achieved by use of a closed-circuit TV system. Exp. I, with 280 right-handed 7-9 yr. old children and college adults, found a developmental change in performance under large rotations (e.g., 180°) as well as evidence of a discontinuous breakdown angle. Exp. II, with 70 high school students, successfully replicated these results. Exp. III investigated the breakdown-angle hypothesis in 30 undergraduates with a more sensitive design. Support was found for the hypothesis, but the region in which breakdown occurred varied somewhat among Ss.—*Journal abstract*.

INFANCY

5992. Bell, Richard Q. (National Inst. of Mental

Health, Bethesda, Md.) **Sleep cycles and skin potential in newborns studied with a simplified observation and recording system.** *Psychophysiology*, 1970(May), Vol. 6(6), 778-786. Devised a simple visual observation system, supplemented by measurement of skin potential, for developmental studies of sleep cycles in settings where multiple electrode placement is not practicable. Findings replicate essential features of quiet and active sleep cycles which were previously reported to exist against the background of decreasing level of physiological arousal, as sleep proceeds. 12 newborns showed approximately $\frac{1}{2}$ of their interfeeding sleeping time in the REM stage of sleep. Skin potential rapidly declined from the waking level, continued to decrease in level throughout sleep, increased in variability during REM sleep, and increased in level at the second waking period.—*Journal abstract.*

5993. Hutt, Corinne & Hutt, S. J. (U. Oxford, England) **The neonatal evoked heart rate response and the law of initial value.** *Psychophysiology*, 1970(May), Vol. 6(6), 661-668.—Presented 2-sec long square wave tones at frequencies of 125 and 1000 Hz and 75-db sound pressure to 6 newborn infants. Mean heart rates were computed for the 10 sec. prior to and the 10 sec. following stimulus onset, i.e., the prestimulus and stimulus heart rate values, respectively. The law of initial value (LIV) was shown to operate strongly only in the case of the 125 Hz stimulus. Even for this stimulus, LIV depended upon the state of the S, showing an appropriate negative correlation between prestimulus and stimulus values in regular sleep and quiet wakefulness but a slightly positive correlation in irregular sleep. In randomly selected control periods, the 1st 5 sec. served as prestimulus values and the 2nd 5 sec. as stimulus values. Regression coefficients for these control periods did not differ significantly from those during which the stimulus was actually present. In view of the special conditions required for its demonstration, the generality of Wilder's "law" is seriously questioned. (17 ref.)—*Journal abstract.*

5994. Korner, Anneliese F. (Stanford U., Medical School, Palo Alto, Calif.) **Visual alertness in neonates: Individual differences and their correlates.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 499-509. Recorded frequencies and durations of spontaneous visual alertness and measured visual pursuit in 32 2- to 3-day-old healthy neonates. Rank correlations of .60, .65, and .74 between the 3 visual measures suggest that Ss who alerted frequently tended also to be the Ss who alerted longest and who were most capable of visual pursuit. Results show intraindividual stability in the visual behaviors and high variance between Ss in their capacity for visual alertness. Ss' sex, parity, birthweight, estimated conceptual age, and postnatal age were not significantly related to the capacity for visual alertness, nor were the moderate levels of obstetric sedation used in this sample. The 3 visual measures, while tapping a shared capacity, had different correlates. Frequencies and durations of visual alertness were significantly related to a number of variables which had in common, moderate degrees of underlying activation and arousal. These factors did not contribute to visual pursuit. Sensitivity to auditory stimuli was significantly correlated with the capacity for visual pursuit but was unrelated to other visual measures. (18 ref.)—*Journal abstract.*

5995. Melson, William H. (U. North Carolina)

Attentional responses of five-month infants to discrepant auditory stimuli. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 382.

5996. Miranda, Simón B. (Case Western Reserve U.) **Visual abilities and pattern preferences of premature infants and full-term neonates.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 189-205.—Used the visual-preference method to present 14 pairs of flat visual stimuli to 27 premature infants of less than 38 wk. conceptional age and to 27 full-term neonates. Average age at time of presentation for premature Ss was 22.5 days; for normal Ss, 3.5 days. There was good inter-O agreement on the visual-fixation responses for both samples. Close similarity between groups was found in the mean length of fixation to a given target in 13 of the 14 stimulus pairs. Premature infants attended selectively to stimuli in 7 of the 14 target pairs, and neonates in 6. The responses of the 2 samples to a pair of stimuli varying in number and size of details was associated with age from conception. The premature sample gave additional differential fixation responses consistent with such an association. Both groups discriminated lines subtending a visual angle of 66 min. Results indicate that infants averaging 1 mo. less in conceptional age than full-term newborns can see and respond differentially to patterned visual stimuli, and that certain responses may be indicative of level of neurological maturation. (27 ref.)—*Journal abstract.*

5997. Nisbett, Richard E. & Gurwitz, Sharon B. (Yale U.) **Weight, sex, and the eating behavior of human newborns.** *Journal of Comparative & Physiological Psychology*, 1970(Oct), Vol. 73(2), 245-253. In Exp. I with 42 healthy single-birth infants, the formula given was sweetened, and heavy Ss were found to increase their intake more than lighter Ss. In Exp. II with 34 Ss, sucking the formula was made difficult, and heavy Ss were found to be less willing to exert effort to obtain food than lighter Ss. Females were more responsive to the sweet taste and less willing to work for their formula than were males. Results parallel weight and sex differences found in human adults and in other organisms, and suggest that there are individual differences in eating behavior among humans which are biologically determined. (40 ref.)—*Journal abstract.*

5998. Shaw, Jon A., Wheeler, Peggy, & Morgan, Donald W. (130th Station Hosp., Heidelberg, W. Germany) **Mother-infant relationship and weight gain in the first month of life.** *Journal of the American Academy of Child Psychiatry*, 1970(Jul), Vol. 9(3), 428-444.—Explored the multiple determinants of infant weight gain in the 1st mo. of life, with particular emphasis directed toward psychosocial and biological variables. It was found that infant weight gain during the neonatal period was relatively independent of psychosocial variables, but was related to biological variables of race, sex, the amount of formula, and the ingestion of solids. Maternal anxiety was not predictably related to infant weight gain. Birth weight was inversely related to maternal anxiety during pregnancy, so that the greater the level of anxiety, the smaller the baby at birth. (45 ref.)—*Journal summary.*

5999. Stratton, Peter M. (U. Leeds, England) **The use of heart rate for the study of habituation in the neonate.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 44-56. Describes a procedure for choosing heart rate (HR) response measures, involving minimal assumptions about the experimental situation. Applied to the habit-

uation of neonates to medium intensity auditory stimuli, this procedure indicated an increase in HR as the most useful response characteristic. Habituation of the acceleratory response was found to take the form of a logarithmic function of trial number. Assumptions underlying the usual methods of correction for initial values are examined and most of them are shown to have been violated in the present data. Further, application of various corrections failed to improve the consistency of measures of habituation. Multiple regression analysis of 14 measures of the acceleratory response show that the increase in rate during the 1st 6 sec. following stimulus onset was the most consistent indicator of habituation. Addition of further measures did not contribute significantly to the relationship (20 ref.)—*Journal abstract*.

6000. Thomas, Hoben. (Pennsylvania State U.) **Psychological assessment instruments for use with human infants.** *Merrill-Palmer Quarterly*, 1970(Apr), Vol. 16(2), 179-223.—Presents a lengthy and intensive review of the research and description of 9 instruments which attempt to quantify human infant behavior: Cattell Infant Intelligence Scale, Gesell Developmental Schedules, Griffith's Mental Development Scale, Bayley's scales, Northwestern Intelligence Tests, Graham's Behavior Tests for Newborns, Prechtl's Neurological Examination, and Flint's Infant Security Scale. Brief mention is given to various instruments, old and new, by Bühler, Kuhlmann, Linfert, Doll, Sheridan, and Caldwell and Drachman. (165 ref.)—*R. V. Hamilton*.

6001. Vítová, Z. & Hrbek, A. (Charles U., Research Inst. for Child Development, Prague, Czechoslovakia) **Ontogeny of cerebral responses to flickering light in human infants during wakefulness and sleep.** *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 391-398.—Studied the ontogeny of responsiveness to repetitive visual stimulation in 135 healthy infants from birth to 2 yr. old. The effect of flickering light on the EEG was minimal at birth, but improved conspicuously during waking from 2-5 mo. of age. In the early 1/2 of this period, the responsiveness to higher flash rates increased abruptly; at the end, significantly longer runs of driven rhythm were observed during stimulation. The amplitude of driven waves became higher and the interference of photic driving with the waves of the resting EEG began to decline. The sudden increase in number of exogenous fibers and dendritic branching in the cortex, with the subsequent increase in quantity of synaptic connections, in this period, might be associated with the prominent improvement of photic driving during mo. 2-5. In sleep, responsiveness in the visual system became better from 6 mo.-1 yr. The high intensity of photic stimulation is considered the most important factor underlying the relatively marked responsiveness to flicker in the 1st 2 yr. of life. (French summary) (29 ref.)—*Journal summary*.

6002. Weiland, I. Hyman & Sperber, Zanwil. (San Fernando Valley Child Guidance Clinic, Van Nuys, Calif.) **Patterns of mother-infant contact: The significance of lateral preference.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 157-165.—Earlier reports by L. Salk that exposure of an infant to the sound of an adult heartbeat is accompanied by less infant crying and reports by Salk and Weiland that mothers tend to hold infants to the left of their chest irrespective of the mother's handedness suggests that the sound of an adult heartbeat is important in anxiety relief for infants and adults. Several experiments to test hypotheses

growing out of the earlier studies are reported and the implications of these studies for the development of early object cathexis are discussed. (16 ref.)—*Journal summary*.

CHILDHOOD

6003. Armentrout, David P. (Inst. for American Universities, Aix-en-Provence, France) **A theoretical note on autonomous behavior as a conditioned consequence.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 275-276.—A topological concept of autonomous behavior is shown to be a compatible holistic consequence of conditioning. The argument is generalized to fit typical childhood development.—*Author abstract*.

6004. Bannatyne, Alex D. (U. Illinois, Inst. for Research on Exceptional Children) **A comparison of visuo-spatial and visuo-motor memory for designs and their relationship to other sensori-motor and psycholinguistic variables.** *Journal of Learning Disabilities*, 1969(Sep), Vol. 2(9), 451-466.—Explores the relationships between visuospatial and visuomotor memory for designs and other sensorimotor and psycholinguistic variables as measured by the Illinois Test of Psycholinguistic Abilities. 50 3rd grade children were given a multiple choice answer (nonmotor) memory for designs test, the scoring categories being correct original, mirror image, simplified design, rotated design, fragmented design, out of proportion design, complicated design, and symmetrical design. These matched a similar classification of the Graham-Kendall Memory for Designs Test (MFD) answers. Results tentatively indicate that the variables on the 2 tests could not be equated, some indicating slow visuospatial development while others suggested neurological dysfunction. Both these syndromes were associated with left-handedness. Rotated drawings (MFD) were associated with right-handedness, and were more frequently drawn by girls. (33 ref.)—*Journal abstract*.

6005. Brown, R. I. & Semple, Lorna. (U. Calgary, Vocational Rehabilitation Research Inst., Alberta, Canada) **Effects of unfamiliarity on the overt verbalization and perceptual motor behaviour of nursery school children.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 291-298.—Subjected a group of 30 3-5 yr. old nursery schoolchildren from poor socioeconomic conditions to familiar and unfamiliar social and physical conditions. Under unfamiliar conditions, even with opportunity to learn the tasks beforehand, Ss showed decreased motor-perceptual and verbal behavior, as well as freezing behavior similar to fear reactions in other animals together with global gazing. Some practical suggestions are made with regard to handling this behavior in clinical situations together with indications for further research.—*Journal abstract*.

6006. Dureman, Ingmar & Pålshammar, Ake. (U. Uppsala, Sweden) **Differences in tracking skill and psychophysiological activation dynamics in children high or low in persistence in schoolwork.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 95-102.—Compared 7 9-10 yr. old children rated by their teachers as high in persistence (HP) and 7 rated as low in persistence (LP) in a simulated car-driving situation with a risk-taking game component. Increased reward was paid for every consecutive 2 min. that they managed to drive without

making more than 5 off the road errors within each of 4 10-min periods. More than 5 errors meant loss of accumulated reward, and the situation thus was meant to evoke a kind of temporal approach-avoidance conflict. Heart rate, skin conductance, and respiratory rate were recorded throughout the session. LP Ss made significantly more off the road errors than the HP Ss during the 4 driving periods. They also had significantly lower skin conductance levels and lower respiratory rates during the work periods, as well as a suggested difference in the pattern of change in skin conductance.—*Journal abstract.*

6007. Eckert, Helen M. (U. California, Berkeley) **Visual-motor tasks at 3 and 4 years of age.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 560.—For 6 boys and 8 girls tested at 3 yr. and again at 4 yr., there were more significant intercorrelations in visual-motor test items for boys which were suggestive of clustering for some tasks. Results suggest data for each sex should be analyzed separately.—*Author abstract.*

6008. Edge, David. (Ed.) (Edinburgh U., Science Studies Unit, Scotland) **The formative years: How children become members of their society.** New York, N.Y.: Schocken, 1970. 72 p. \$4.50(cloth), \$1.75(paper).

6009. Edwards, Joseph S. & Edwards, Diane D. (U. Kansas, Medical Center) **Rate of behavior development: Direct and continuous measurement.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 633-634.—Describes a new method using direct and continuous records of specific behavior rates which provides precisely quantified descriptions of behavior development. Dynamic developmental changes are reflected in the acceleration, maintenance, and deceleration of the behavior rates.—*Journal abstract.*

6010. Fehr, F. S. (U. Illinois, Children's Research Center) **A simple method for assessing body movement and potential artifacts in the physiological recordings of young children.** *Psychophysiology*, 1970(May), Vol. 6(6), 787-789.—Describes a method which involves the attachment of open-ended electrodes to the cloth cover of the chair in which the S reclines. 12 normal full-term male infants served as Ss. Techniques are discussed for limiting possible extraneous noise, and basic findings under adverse laboratory conditions are presented.—*Journal abstract.*

6011. Fowler, William. (Ontario Inst. for Studies in Education, Toronto, Canada) **Problems of deprivation and developmental learning.** *Merrill-Palmer Quarterly*, 1970(Apr), Vol. 16(2), 141-161.—Presents a review which suggests that the important foci of investigation in the dimension of developmental learning of cognitive processes are (a) the comparative importance of early vs. later stimulation, (b) the existence of critical periods for and sequential stages of cognitive development, (c) the cumulative role of stimulation in the developing of abilities and a related concern, e.g., the patterning of abilities in content, form, and level according to the cumulative differentiation of stimulation. Suggested lines for inquiry and investigation are: (a) cumulative and ecological aspects of developmental research, (b) development of logic (empirical measures), (c) identification and interaction of stimulation specifics of developmental deprivation, (d) significance of longitudinal approach to the study of developmental learning, (e) stages and sequences, (f) intervention studies of comprehensive and cumulative effect of systematic and controlled stimu-

lation on developmental learning, (g) cognitive health and developmental learning clinics, and (h) priorities of subject area and cognitive modes in developmental learning. (102 ref.)—*R. V. Hamilton.*

6012. Helper, Malcolm M. (Ohio State U.) **Comparison of pictorial and verbal semantic scales as used by children.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 149-156.—Studied the ability of pictorial rating scales to assess the major semantic dimensions of evaluation and potency. Children at 4 grade levels (4th and 6th grades, kindergarten, and nursery school 4 yr. olds) rated 21 concepts on 8 pictorial scales and on 4 verbal marker scales. Very clear-cut evaluation and potency factors, each defined by both types of scales, emerged from factor analysis (with blind rotation) of the scale intercorrelations in the 2 oldest groups. Only the pictorial scales yielded a clear-cut potency factor in the kindergartners. Neither type of scale yielded interpretable factors in the nursery school group. It is concluded that a pictorial scale format has some advantage in getting semantic ratings from children in the earliest school grades.—*Journal summary.*

6013. Kagan, Jerome. (Harvard U.) **Attention and psychological change in the young child.** *Science*, 1970(Nov), Vol. 170(3960), 826-832.—Suggests that alterations in behavior and cognitive structure involve a variety of processes beyond the principles of conditioning and that the changes in cognitive structure that occur when a child encounters discrepant events "should provide insights into the nature of psychological growth." It is noted that quantification of the process of attention in the child is still undeveloped, as the variables in question reflect different aspects of the attention process. (31 ref.)—*P. McMillan.*

6014. Kaplan, Burt E. (U. Wisconsin) **Psychophysiological and cognitive development in children: The relationship of skin conductance and heart rate to word associations and task requirements.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 18-26.—Recorded heart rate and skin resistance from 96 5-7 yr. old male and female children during the following conditions: low arousal (rest), high arousal (auditory and visual stimulation), and administration of a Word Association Test (WAT) and the Peabody Picture Vocabulary Test (PPVT). Ss who gave a mature response pattern on the WAT tended to have lower conductance levels than immature responders. Heart rate decreased during environmental intake (high arousal), increased during environmental rejection (WAT), and was unchanged during a combined intake and rejection situation (PPVT). Skin conductance data were consistent with recent theories concerning the development of mature cognitive behaviors in children and the psychophysiological correlates of complex and simple behaviors. (22 ref.)—*Journal abstract.*

6015. Khandrikov, V. & Markelov, V. (Moscow State U., USSR) **Vliyaniye motivov srovnaniya na osnovnye kachestvennye osobennosti dvigatel'noi deyatel'nosti srednikh shkol'nikov v zavisimosti ot sily nervnoi sistemy.** [Influence of competitive motives on the basic qualitative features of motor activity of middle schoolchildren as a function of strength of nervous system.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 159-166.—22 12-13 yr. old Ss participated in a study to determine (a) whether there are typological differences in the influence of competitive motives on the basic motor parameters (strength, rapidity, endurance,

and coordination of movements), and (b) whether the deficiencies, associated with the weak type of nervous system, can be overcome by special training. Competitive motives have different influences on motor parameters, depending on strength of nervous system. Those with a weak type of nervous system performed in competition at a lower level than during training; those with strong type of nervous system, at a higher level.—*I. D. London.*

6016. Kneutgen, Johannes. (100 Kaldauer Str., Siegburg, W. Germany) **Eine Musikform und ihre biologische Funktion: Über die Wirkungsweise der Wiegenlieder.** [The biological function of a category of music: On the effect of lullabies.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(2), 245-265.—Over a time span of 3 mo. an Argentinian lullaby was played nearly every day in sessions lasting from 30 min. to 2 hr. for 4 Ss. Breathing rhythm and EKG were recorded during this time. The lullaby had the effect of markedly decreasing heart beats. The breathing rhythm became synchronized with the rhythm of the music. No such effects were found in a control group exposed to jazz music. The enhancing effect of lullabies in successful nursing care is pointed out. (English & French summaries) (17 ref.)—*W. J. Koppitz.*

6017. Lessing, Elise E., Zagorin, Susan W., & Nelson, Dorothy. (Inst. for Juvenile Research, Chicago, Ill.) **WISC subtest and IQ score correlates of father absence.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 181-195.—Ss were 311 boys and 122 girls who had been given the WISC as part of their diagnostic evaluation at a child guidance clinic. A history of prolonged father absence (found in 138 Ss) was associated with a lower Performance IQ and lower scores on Block Design and Object Assembly, regardless of sex or social class, and with lower scores on Arithmetic for boys only. Working-class, father-absent Ss also earned lower mean Verbal and Full Scale IQ scores. Middle-class, father-absent Ss earned a higher mean Verbal IQ than father-absent Ss. Of the 2 subgroups of Ss with a history of father absence, only those with no father figure in the home at the time of testing (but not those with a stepfather) differed from father-present Ss in regard to WISC scores. (25 ref.)—*Author abstract.*

6018. Marcus, Joseph; Thomas, Alexander, & Chess, Stella. (Hebrew U., Hadassah Medical School, Jerusalem, Israel) **Behavioral individuality in kibbutz children.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 43-54.—Reviews the literature on kibbutz children to demonstrate that the role that the child's individuality plays in the child-environment interactional system has been neglected and there has been a tendency toward stereotyping kibbutz children. Using direct observation and behavioral interviews focused on the individuality of temperamental characteristics, 3 girls and 3 boys between 3 and 4 yr. old were studied over 2 yr. Results substantiate the clinical impression that the individual temperamental pattern of each child constitutes a most important factor in his development. The importance of individuality in theory of child development and in child caretaking is pointed out. (26 ref.)—*Journal abstract.*

6019. Nalven, Frederic B. (Manhattan School for Seriously Disturbed Children, New York, N.Y.) **Manifest fears and worries of ghetto vs middle-class suburban children.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 285-286.—Compared the manifest fears and worries of 101 ghetto 5th and 6th graders with those of

150 of their suburban counterparts. The major difference was the greater number of specific animal fears (including many rats and roaches) reported by the ghetto Ss. Suggestions for developing relevant curriculum materials are made.—*Journal abstract.*

6020. Nathan, Susan W. & Hass, Wilbur A. (Children's Hosp., Pittsburgh, Pa.) **Age-development in the linear representation of words and objects.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 197-204.—130 4-10 yr. old children were asked to select line drawings to represent common objects, and then to select from the same line drawings ones which represented words corresponding to those objects. The following hypotheses, based on H. Werner and B. Kaplan's approach to symbol formation, were confirmed: (a) as age increases there is greater consensus among children as to which of several line drawings represents a given word or object, and (b) as age increases children are more likely to choose the same line drawing to represent both an object and the word corresponding to that object.—*Author abstract.*

6021. Politzer, Robert L. & Weiss, Louis. (Stanford U.) **Developmental aspects of auditory discrimination, echo response, and recall.** *Modern Language Journal*, 1969(Feb), Vol. 53(2), 75-85.—Reviewed an experiment designed to ascertain if auditory discrimination, pronunciation, and recall of vocabulary varied as a function of age. Ss were 1st, 3rd, 5th, 7th, and 9th graders from the same socioeconomic stratum. Ss in the auditory discrimination test differentiated between sets of French vowel phonemes, French vowel sounds, and English vowel sounds. In the pronunciation test, each S was shown a picture representing the word to be pronounced and a model of the pronunciation. In the recall test, S was shown the same picture as above and recalled the name of each item. Data indicate that in each area tested, the level of performance tends to increase with maturation. (17 ref.)—*C. O'Donnell.*

6022. Pollitt, Ernesto & Ricciuti, Henry. (Yale U., Medical School) **Biological and social correlates of stature among children in the slums of Lima, Peru.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 735-747.—A study of 48 children, 6-53 mo. old, with contrasting stature from the slums of Lima, Peru showed that the short Ss were more likely to have shorter mothers, who had had more pregnancies, less years of schooling, and a greater number of marriages. Results suggest that although differences in stature might reflect differences in nutritional background, they are also likely to reflect differences in other important biosocial factors. (29 ref.)—*Journal abstract.*

6023. Sukhanova, N. V. (Sechenov Inst. of Evolutionary Physiology & Biochemistry, Leningrad, USSR) **Osobennosti formirovani vegetativnogo komponenta rechevoi reaktsii cheloveka.** [Features of the formation of the autonomic component of the speech reaction in man.] *Zhurnal Vyshei Nervnoi Deyatel'nosti*, 1969, Vol. 19(2), 313-318.—Studied (a) the features typifying the autonomic component of the speech reaction at various stages of ontogenesis, and (b) the autonomic component as a function of the developmental level of speech-motor coordination. 4 groups of Ss: 23 1.5-2 yr. olds, 23 4-5 yr. olds, 23 6-7 yr. olds, served as Ss, 15 adults as controls. Autonomic changes in speech activity were indexed by the reaction of the cardiovascular system: pulse-rate, arterial pressure, EKG. Data suggest that (a) speech is accompanied by the expenditure of energy and by

enhanced activity of the systems for securing gas exchange (respiration and circulation), (b) autonomic reactions can be directly included in the articulatory act itself, (c) autonomic reactions are modified under the action of emotions which almost always accompany human speech.—*I. D. London.*

6024. Watson, Peter. (Trent U., Peterborough, Ontario, Canada) **Individual differences in children's reactions to frustrative nonreward.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 216-234.—Investigated individual differences in children's reactions to frustrative nonreward in a series of 3 exploratory studies. In Exp. I, 22 kindergarten Ss were given a series of double-lever trials in which responses to the 1st lever were reinforced on a 50% schedule while 2nd lever responses were given 100% reinforcement. In Exp. II, Ss were 15 males and 15 females from each of kindergarten, and Grades 2, 4, and 6. Ss were given 8 choice trials with predetermined success or failure outcomes. In Exp. III, 30 male and 30 female Grade 2 Ss were presented the same task as in Exp. II except that 1/2 of the Ss were told the problem would be very difficult and the other 1/2 that it would be very easy. Most Ss between the ages of 5 and 13 yr. tended to show increments in motivation and increased avoidance tendencies after nonreward. Children differed in the latency of these reactions: some Ss demonstrated immediate or short-latency reactions, while in others the reaction was delayed or of long latency. The immediate reaction was relatively more common in younger children and in those with low expectancy of success, while older children and those with high expectancy of success tended more frequently to demonstrate the delayed reaction to nonreward.—*Journal abstract.*

Learning

6025. Ames, Louise B. (Gesell Inst. of Child Development, New Haven, Conn.) **A low intelligence quotient often not recognized as the chief cause of many learning difficulties.** *Journal of Learning Disabilities*, 1968(Dec), Vol. 1(2), 735-739.—Suggests that too often low IQ is not recognized as the problem for inadequate school performance, and proposes that whenever a child is having serious trouble in school, his IQ be checked before a more elaborate search for the cause is undertaken. Illustrative cases are presented to demonstrate other inadequacies which often accompany low IQ, i.e., immaturity and visual problems, and various solutions to the problem of an improvement program.—*M. Maney.*

6026. Di James, Dennis D. (U. Southern California) **The effect of three classes of reinforcement on verbal operant conditioning.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 641.

6027. Doan, Helen M. (York U., Ontario, Canada) **Effects of correction and non-correction training procedures on "easy" and "hard" discrimination learning in children.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 459-466.—Examined the effects of correction and noncorrection training procedures on 40 4- and 5-yr-old children's 2-choice simultaneous visual discrimination learning, when either easy or hard tasks were presented. Results indicate that performance on the more difficult problem was facilitated by the use of a correction procedure. There was very little difference,

however, between the group trained with the correction procedure and that trained with the noncorrection procedure on the easy task.—*Journal abstract.*

6028. Fuld, Paula A. (Fordham U., Div. of Foundations, Psychology & Services) **Syntactical mediation of paired-associate learning as a function of age.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 248-256.—Investigated mediational deficiency and productional deficiency in learning pairs of picture names using groups of bright, upper socioeconomic status Ss with mean ages of 56-94 mo. Productional deficiency was circumvented in the experimental Ss by reading a sentence about each pair to them during the 1st trial. The control Ss instead heard the names of the stimuli repeated together. A self-paced anticipation interval was used with a 3-sec presentation of the pairs and no ITI. A steep age gradient was obtained for the control group means, but most of the experimental Ss made virtually no errors. Results support the hypotheses: (a) young children's ability to learn paired associates increase as a function of age, (b) when syntactical links are provided, the paired-associate learning of both younger and older children is facilitated. (17 ref.)—*Journal abstract.*

6029. Goulet, L. R. & Sterna, Harvey L. (U. Illinois) **Verbal-discrimination learning and transfer with verbal and pictorial materials.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 257-263.—Groups of 4th grade children (N = 48) learned a 6-pair discrimination list involving either word or picture materials, followed by discrimination-reversal transfer lists consisting of either picture-equivalent or word-equivalent pairs. The words lists were easier than picture lists in acquisition. On List 2, positive transfer was found on the initial practice trials, with an inhibitory (negative transfer) effect apparent on later trials. The transfer data were in direct accord with predictions generated from the frequency theory of verbal-discrimination learning and support the extension of the theory to discrimination tasks involving nonverbal materials. Transfer functions were highly similar whether the class of materials was the same (Word-Word or Picture-Picture) or was changed (Word-Picture or Picture-Word) on Lists 1 and 2.—*Journal abstract.*

6030. Henderson, Kent. (Ontario Inst. for Studies in Education, Toronto, Canada) **Reaction to success and failure in complex learning: A postfeedback effect.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 206-215.—Gave 60 female 7-10 yr. olds 2 concept identification (CI) problems in which feedback was actually scheduled for 12 presolution and 6 criterion trials in each problem. 5 sec. after each CI trial, S made a 2nd response (R₂) in which she either pulled a lever or pushed a panel under high or low effort. The next CI trial began after a 20-sec interval. R₂ response and movement time was longer following incorrect than correct feedback contrary to expectations generalized from frustration theory. Lever vs. panel and high vs. low effort influenced overall time but no interactions with feedback occurred. The postfeedback effect could be attributed to cognitive or motivational processes that elicit greater response interference following incorrect than correct feedback.—*Journal abstract.*

6031. Hoglund, Janet & Locke, John L. (U. Illinois) **Note on servo theory in children's phonetic learning.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 417-418.—2 groups of 10 matched 4-yr-olds were given the

task of learning a novel phonetic response with or without a previous period of exposure to the stimulus. The 2 groups were very similar in the level and distribution of their learning, suggesting some mild, tentative support for a servo model of phonetic learning.—*Journal abstract.*

6033. Morin, Robert E., Hoving, Kenneth L., & Konick, Dorothy S. (Kent State U.) **Short-term memory in children: Keeping track of variables with few or many states.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 181-188.—Attempted to determine if ability to remember the most recent state of a variable (e.g., that dog was the last animal seen) depends on whether the variable has few or many states. 24 male and 24 female 4-yr-old Ss were used to test the hypothesis in young children. Ss were presented 24 line drawings of 6 familiar objects within 4 variables (e.g., toys: wagon, boat, bike, drum, sled, train). After presentation of 4 items, Ss were asked for the most recent state of 1 variable. Each trial contained an item from each of the 4 variables. Items were presented visually to $\frac{1}{2}$ of the Ss and orally to the others. Recall errors were of a single type: when Ss responded incorrectly they always named an alternate state of the same variable.—*Journal abstract.*

6034. Nolan, J. Dennis & Pendarvis, Leah V. (Ohio State U.) **Effects of variable-irrelevant dimensions on the discrimination reversal learning of nursery school children.** *Journal of Experimental Psychology*, 1970(Dec), Vol. 86(3), 428-433.—48 nursery school children learned color, form, or size discriminations, followed by discrimination reversals. There were either 1 or 2 variable-irrelevant dimensions present in both original learning and reversal. In the original discrimination, size problems were learned more readily than form problems, and form more readily than color problems. The form and color original problems were somewhat more difficult with 2 irrelevant dimensions than with 1 irrelevant dimension. Size problems were learned quickly under both conditions. The form and color reversals were facilitated under 2 irrelevant dimension conditions, but not under 1 irrelevant dimension conditions. The size reversals were accomplished very rapidly under both conditions. Results are discussed in terms of their implications for different models of discrimination learning. (16 ref.)—*Journal abstract.*

6035. Paletz, Merrill D. (Adler Zone Center, Champaign, Ill.) **Prior reinforcement history as an explanation for the effects of sex of subject and experimenter in social reinforcement paradigms.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 227-238.—In this study of the cross-sex effect, it was predicted that children are more satiated for reinforcement from same-sexed adults than for that from opposite-sexed adults, and that social reinforcement from opposite-sexed adults would be the more effective in an experimental situation. It was also predicted that the E who had been neutral in the pretraining would be more effective in the reinforcement condition than the one who had been highly reinforcing. 7-9 yr. old Ss were exposed to a male adult and a female adult E during 2 pretraining games. 1 adult was highly reinforcing, the other neutral. Following the pretraining, 1 of these adults served as the E in a training task of marble dropping.

Only a minor prediction was supported and this support was weak. (30 ref.)—*Author abstract.*

6036. Rice, James A. (U. Houston) **Right-left discrimination: Systematic reversal in bright children.** *Journal of Learning Disabilities*, 1968(Nov), Vol. 1(11), 654-659.—Attempts to clarify the issue of systematic reversal in right-left discrimination particularly as it has relevance for school-related tasks and for visual-motor and visual-memory-motor abilities. A 24-item right-left discrimination test, the Auditory-Vocal Automatic and the Auditory-Vocal Sequencing subtests of the Illinois Test of Psycholinguistic Abilities, the Benton Visual Retention Test, and the Wide Range Achievement Test were administered to 200 kindergarten-3rd grade bright children. Results of chi-squares between reversal (R) and nonreversal (NR) subgroups computed for incidence in grade, sex, and handedness show that: (a) incidence of the R tendency drops markedly from kindergarten to 3rd grade; (b) neither sex nor handedness appear related to the occurrence of the R tendency; and (c) age, particularly at the kindergarten level, appears to be a factor, with R children being younger. It is concluded that since little difference of either statistical or operational significance is apparent between R and NR groups, it is probable that age is a significant factor related to differences in academic achievement, and therefore, the question of a cumulative effect is invalid.—*M. Maney.*

6037. Rosenbaum, Michael. (U. Illinois) **A methodological investigation of social reinforcement studies: The effects of fixed-interval and fixed-ratio schedules on time and rate measures.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 938-939.

6038. Schwenn, Elizabeth A. & Davidson, Robert E. (U. Cincinnati) **Syntactical mediation and transfer.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 440-444.—95th and 6th grade Ss learned 2 paired-associate lists of 15 noun pairs each. The lists conformed either to an A-B, C-D or an A-B, A-C transfer paradigm. 6 alternating study and test trials were given on the 1st list. On the 2nd list, 4 study and test trials were given and independent groups of Ss were given different verbal contexts which linked the members of each pair on the 2nd list (simple declarative sentence, conjunction phrase, or no context). The dependent variable of interest was the number of correct responses on the 1st 2 trials of the 2nd list. Results show that sentences facilitated 2nd list learning over both the conjunction and the no context condition and that conjunctions did not differ from the no context condition. Overall comparison of paradigms indicate significant negative transfer in the A-C condition. While there was a tendency toward less negative transfer in the sentence condition than in the conjunction and no context conditions, the interaction only approached statistical significance.—*Journal abstract.*

6039. Williams, Joanna P. (U. Pennsylvania, Graduate School of Education) **Training kindergarten children to discriminate letter-like forms.** *American Educational Research Journal*, 1969(Nov), Vol. 6(4), 501-514.—Tested 64 kindergartners on their ability to discriminate 6 Gibson graphemes after 1 of 3 types of training: (a) discrimination training in which transformations of the standards were the comparison stimuli; (b) discrimination training in which the comparison stimuli were very different from the standards; and (c) reproduction training, in which the standards were

traced and copied, and no comparison stimuli were presented. The 1st group was significantly superior to the other 2 groups, which did not differ. Performance also varied as a function of the type of transformation. Implications for the development of effective reading readiness materials and for the appropriate timing of this type of training are discussed.—*Journal abstract.*

Concepts & Language

6040. Corman, Harvey H. & Escalona, Sibylle K. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Stages of sensorimotor development: A replication study.** *Merrill-Palmer Quarterly*, 1969(Oct), Vol. 15(4), 351-361.—Presents a replication (247 Ss in the cross-sectional samples, and 45 Ss in the longitudinal studies; age range, 9-26.5 mo.) of Piaget's observations on cognitive development and the "construction of a set of scales, designed to measure early cognitive development in terms of sensorimotor stages": prehension, which reflects developmental changes from the lowest level of Stage II, primary circular reactions, to secondary circular reactions when eye-hand coordination and other schemas that combine different modalities are available; object permanence, concerning the establishment of the object concept, external, relatively permanent, and existing independent of the self; and spatial relationships, the capacity to adapt to and comprehend the objective properties of physical space. The scales "lend themselves to purposes different from the purposes of tests of general intelligence": for research and, in a practical sense, to the "design of preventive and compensatory programs for young children."—*R. V. Hamilton.*

6041. de Lemos, Marion M. (Australian Council for Educational Research, Melbourne, Victoria) **The development of conservation in aboriginal children.** *International Journal of Psychology*, 1969, Vol. 4(4), 255-269.—145 8-15 yr. old Ss, from 2 aboriginal settlements in Australia, took tests based upon Piaget's studies of conservation of quantity, weight, volume, length, area, and number. Results generally offer support for Piaget's stages, though conservation (especially of area) tends to develop much later in aboriginal Ss than in European Ss and in some cases does not develop. A further discrepancy involves failure to find an invariant order of development among aboriginals for conservation of quantity and weight. Educational, language, and genetic factors offer possibilities that may account for differences between European and aboriginal Ss. (38 ref.)—*S. E. Gavin.*

6042. Fredrick, Wayne C. (U. Wisconsin) **Reliability of measures from 500 written words.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 126.—Gives data on the reliability of the K. W. Hunt measures of sentence maturity when 500-word samples are used. The themes of 135 8th graders were collected weekly for 6 wk. and samples of at least 1000 words were extracted and scored on 16 of the measures used by Hunt. It was found that "samples much larger than 500 words are needed to give a reliable indication of the kinds of subordinate structures used, but for scores such as clause length, ... [the shortest grammatical units into which sentences can be segmented without producing sentence fragments], and sentence length, the reliability of the 500-word sample may ... be sufficient."—*M. West.*

6043. Harlen, W. (Bristol U., Inst. of Education, England) **The development of scientific concepts in young children.** *Educational Research*, 1968(Nov), Vol.

11(1), 4-13.—Reviews the research concerning the effects of maturation and experience on the development and acceleration of concept formation. Piaget's analysis of the development of scientific concepts in young children is discussed, and 3 main types of research are considered: the observation of concept formation after (a) unguided experiences, (b) guided experiences over an extended period of time, and (c) short-term training in specific activities. Generally, training effects lasted at least for a short time, and it is concluded that "... certain experience does aid concept formation, but only within limits ... determined by the type of experience and the child's point of development when exposed to it." (27 ref.)—*R. Wiltz.*

6044. Heron, Alastair & Simonsson, Märta. (U. Zambia, Lusaka) **Weight conservation in Zambian children: A non-verbal approach.** *International Journal of Psychology*, 1969, Vol. 4(4), 281-292.—African and European schoolchildren attending Zambian schools served as Ss in a nonverbal approach for determining weight conservation ability. Ss first received practice with scale weights. Next they experienced obviously equal and obviously unequal balls of plasticine. Finally they took the Piagetian test itself. Results show that 40-50% of urban African Zambian primary schoolchildren fail to demonstrate conservation of weight by age 15. At early ages, however, the proportion of conservers among Zambian children is comparable with that found elsewhere. Data from the control group of Ss of European extraction and upbringing are like those reported from Switzerland and the United States in studies using the classical Geneva method. Factors related to later elementary school years appear to account for deficits in proportions of conservers from age 10 onwards. Studies of young adult nonconservers may cast light on the basis for deficit. In general, the nonverbal method for testing conservation works satisfactorily. (16 ref.)—*S. E. Gavin.*

6045. Ilan, Leila C. & Tan, Allen L. (U. Philippines, Manila) **Attribution of punishment among Filipino children.** *Philippine Journal of Psychology*, 1969(Jun), Vol. 2(1), 4-7.—In a test of Piaget's proposed 2 stages of morality, a group of 3rd and 6th graders were presented with 3 stories each involving some misbehavior and were asked to write down what they thought should be done to the offenders. In 1 story, the misbehavior was accidental; in another story, it was intentional; while in the 3rd story, motives were present but no consequence ensued. Analysis of variance performed on the data resulted in a negligible Grade \times Conditions-of-Misbehavior interaction which was contrary to Piaget's theory of moral development. The analysis revealed that females, as well as younger children, tend to be more punitive while all children regardless of age, seem to consider intentions more than consequences in attributing punishments.—*Journal abstract.*

6046. Keislar, Evan R. & Stern, Carolyn. (U. California, Los Angeles) **Differentiated instruction in problem solving for children of different mental ability levels.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 445-450.—During an 8-day instructional program, 82 high-IQ 2nd and 3rd graders assigned to 3 levels (4th, 5th, and 6th grade), were taught to solve problems based on discovering the rule for matching, using either a simple gambler's strategy or a more complex hypothesis testing approach. On each of the 3 criteria (posttest, transfer, and retention), Ss in the

high-ma group who were taught the complex strategy were superior to those taught the simple strategy: the reverse was true with the low-ma group. The disordinal interaction was significant ($p < .05$) for both posttest and transfer.—*Journal abstract.*

6047. Kendall, Martha B. & Sibley, Ralph F. (U. New Hampshire) **Social class differences in time orientation: Artifact?** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 187-191.—Replicated L. L. LeShan's (see PA, Vol. 27:3494) study which reported class differences in the time spans of children's stories. In this replication, 20 lower-class and 18-middle-class 6th graders told stories about a picture. LeShan's finding that middle-class stories covered a longer time span was supported. Middle-class Ss, however, also told longer stories and used more past tense verbs than lower-class Ss. Analysis of the results indicated that time span may have been an artifact of story length.—*Journal summary.*

6048. Kershner, John R. (U. California, Los Angeles) **Children's spatial representation of directional movement and figure orientations along horizontal and vertical dimensions.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 641-642.—Tested 160 1st grade children for their ability to conserve multiple spatial relations. An analysis of task-related errors supported J. Piaget's distinction between perceptual and representational space as well as the importance of eye-hand movement and the relative position of objects in the perceptual field. Ss with a preference for their right hand and left eye showed more success in reproducing spatial relations than Ss with right-hand and right-eye preference. Results support a visual-imagery mode of representation but not the importance of verbal knowledge or activity. The significance of mixed lateral dominance to spatial orientation was seen to be consistent with neurophysiological evidence.—*Journal abstract.*

6049. Kingsley, Phillip. R. (U. Michigan) **Developmental changes in children's use of language: Relationships with certain aspects of cognitive development.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 931.

6050. Kingston, Albert J. & Weaver, Wendell W. (U. Georgia) **Feasibility of cloze techniques for teaching and evaluating culturally disadvantaged beginning readers.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 205-214.—182 1st graders in rural, white schools in North Carolina and Georgia were taught to complete deletions in the natural language. These completed deletions were then used to study oral and written language performance by the Ss. It was found that 1st graders performed the tasks presented and that the measures offered promise for use in evaluating the relationship of the child's oral language performance to his performance with reading tasks. The 6 cloze tasks were better predictors of end-of-course standard reading test scores than were the readiness and basal reader instruments.—*Journal summary.*

6051. Klindová, L'uboslava. (Research Inst. of Pedagogy, Bratislava, Czechoslovakia) **O niektorých osobitostach triedenia predmetov u detí od 3 do 7 rokov.** [Some problems in the classification of child development.] *Jednotná Škola*, 1969(Jan), Vol. 21(1), 46-60.—Reviews special features of classification by 3-7 yr. old children. 2 variations in the process of classification of objects by the picture method are discussed: forming categories from individual pictures, and forming

exclusion categories by removing objects that do not belong. Evaluation is made according to the number of correct classification operations and according to verbal expression given by the children for their operations. Survey results show that the development rate in children is not the same in all age groups, i.e., increase and slowing down often alternate and there is often a period of stagnation especially in the case of 7 yr. olds. It is concluded that, from the quantitative viewpoint, the standard of classification ranges from random grouping without a definite classification criterion, to a comparatively high level criteria of a different hierarchy. (Russian summary)—*English summary.*

6052. Lloyd, Barbara B. & Light, Richard A. (U. Sussex, England) **Cognitive stages of dream concept development in English children.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 271-272.—A questionnaire designed to diagnose stages in dream concept development was administered to 40 3-9 yr. old English Ss. Guttman scalogram analysis showed that the 6 stages approximated the invariant, unidimensional scale described by Kohlberg. A Spearman rank-order coefficient showed a high positive relationship between age and stage. Results support a stage hypothesis and offer further evidence of the role of maturation in dream concept development.—*Author abstract.*

6053. Peisach, Estelle & Wein, Norman. (New York U., School of Education) **Relationship of conservation explanations to item difficulty.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 167-180.—The relevance of explanations as a measure of a child's understanding of the principle of conservation has been critically questioned. The relationship between the type of explanation and difficulty level of the conservation task was studied on the assumption that changes in the distribution of explanations, as a function of item difficulty, would demonstrate the pertinence of the explanation as a measure of conservation. The frequency of various explanations of 180 children classified by grade (kindergarten, 1st and 2nd), sex, socioeconomic status level, and a conservation score independent of explanation, were examined in relation to the difficulty level of 7 conservation items. Changes in response obtained relative to the difficulty level of the items suggest that inability to express cogent reasons for conservation is reflective of a lower level of conservation conceptualization.—*Author abstract.*

6054. Roodin, Marlene L. & Gruen, Gerald E. (Purdue U.) **The role of memory in making transitive judgments.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 264-275.—Attempted to determine the effect of a memory aid on children's transitive judgments. $\frac{1}{2}$ of the 24 middle-class Ss at 5, 6, and 7-yr-old were allowed to use a memory aid for initial comparisons ($A > B$ and $B > C$) while the other $\frac{1}{2}$ were not. Ss responses were evaluated according to 2 criteria: (a) correct (transitive) judgment alone (i.e., $A > C$), and (b) correct judgment plus verbal explanation of the transitive judgment. Ss given the memory aid made significantly more transitive judgments and correct verbal explanations of transitivity at every age level. Transitivity increased monotonically as a function of age. Virtually all Ss who could verbally explain transitivity also made correct, transitive judgments, although the converse was not true.—*Journal abstract.*

6055. Rothenberg, Barbara B. & Courtney, Rosalea G. (Education Testing Service, Princeton, N.J.) **A devel-**

opmental study of nonconservation choices in young children. *Merrill-Palmer Quarterly*, 1969(Oct), Vol. 15(4), 362-373.—The factor of proximity, in addition to length, density, and manipulation, in young children's nonconservation choices was included in this study which showed that young Ss (2.5-3.3 yr. old) tended to select primarily on the basis of closeness while the older Ss (5.3-6.2 yr. old) tended to choose on the basis of length; lower socioeconomic Ss tended to choose on the basis of closeness and sometimes manipulation, while the middle socioeconomic Ss tended to choose on the basis of length; and that significant sex differences did not emerge.—*R. V. Hamilton.*

6058. Seggie, J. L. (U. Newcastle, New South Wales, Australia) **The utilization by children and adults of binary propositional thinking in concept learning.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 235-247.—An analysis of conjunctive concepts based on 2 binary stimulus dimensions reveals that the relationship between the individual relevant stimuli and classification is 1 of implication. In the case of irrelevant dimensions a tautologous relationship exists. J. Piaget's contention was tested that adult Ss can utilize such relationships in problem solving, while children have difficulty in this area. 2 groups of 14 12-13 yr. olds and 2 groups of 14 undergraduates learned a conjunctive concept. Prior to concept learning $\frac{1}{2}$ of the Ss were given the opportunity to establish the logical relationships which existed between the individual dimensions and the classification. These Ss learned the concept with significantly fewer errors than the remaining Ss. The adults were relatively more efficient in the utilization of the logical relationships than the children. During the preconcept learning period interesting differences appeared in the search strategy of adult and child Ss, differences not encompassed by Piagetian theory.—*Journal abstract.*

6059. Stones, E. (U. Birmingham, School of Education, England) **Verbal labelling and concept formation in primary school children.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 245-252.—Gave 30 primary school children aged 7, 9, and 11 yr. old, the standard Vigotsky sorting task and labeled specially constructed extension tests utilizing 3-dimensional everyday objects and 3-dimensional drawings of objects. 30 other children of the same ages were given identical tasks except that the nonsense syllables were omitted from the base of the experimental blocks. The English Picture Vocabulary Test was also administered on a group basis as a test of language ability. Most of the Ss using the labeled blocks, but hardly any Ss using unlabeled blocks, succeeded in the extension tests. The extent to which these results bear on the problem of the relationship between concept formation and the use of language is discussed. (19 ref.)—*Journal abstract.*

6060. Vanyushkina, L. N. (Moscow State U., USSR) **Vyrazitel'nye komponenty naglyadno-deistvennogo myshleniya u detei rannego vozrasta.** [Expressive components of visually active thinking in children of

early age.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 139-142.—Ss were 13 15-29 mo. old children. Right-handed tasks were accompanied by first imitative and then anticipatory movements of the fingers of the left hand, which reflects the processes of visually active thinking. The findings are summarized.—*I. D. London.*

6061. Weiss, A. A. (Hebrew U., Jerusalem, Israel) **Bender-Gestalt performance and concept formulation.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 76-81.—Developed a 16-item multiple-choice-type series of graphic stimuli to test the presence or absence of certain concepts implied in the developmental improvement of the execution of the Bender-Gestalt (B-G) test in small children. 26 kindergarten children and 26 1st graders were individually administered the B-G and Concept tests. No sex differences were found but significant differences were obtained on both instruments between the 2 age groups. While the presence of the concepts concerned is significantly related to the level of execution in kindergarten Ss, the correlation was nonsignificant in 1st graders. Bender's developmental table and raw data show that improvement beyond age 7 is not dependent on concepts except those of numbers and the diagonal, and the ability to integrate 2 principles.—*Journal abstract.*

6065. Fischbein, E., Pampu, Ileana, & Minzat, I. (Inst. of Psychology, Bucharest, Romania) **Effects of age and instruction on combinatory ability in children.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 261-270.—Investigated the effect of direct instruction on the ability to handle permutations and arrangements, as an example of a problem at the level of formal operations. 60 Bucharest schoolchildren, 20 each aged 10, 12, and 14 yr. tested individually, 1st estimated the number of possible permutations with 3, 4, and 5 objects.

Results show that these subjective estimates improved with age, with a threshold (or marked improvement) at age 12, though there was serious underestimating at all ages. A step-by-step teaching strategy using generative "tree diagrams" was then used. Even the 10 yr. olds learned the use of the tree diagrams and the appropriate procedures for permutations and arrangements. (16 ref.)—*Journal abstract.*

6066. Golden, Nancy E. & Steiner, Sharon R. (School District 54, Schaumburg, Ill.) **Auditory and visual functions in good and poor readers.** *Journal of Learning Disabilities*, 1969(Sep), Vol. 2(9), 476-481.—Investigates the relationship between specific auditory and visual functions and reading performance. 10 pairs of 2nd graders matched as good and poor readers on the basis of MA, IQ, and CA were tested with several subtests from the revised Illinois Test of Psycholinguistic Abilities and the Monroe Visualization Test. Findings suggest that poor readers were lacking primarily in auditory functions rather than visual. (15 ref.)—*Journal abstract.*

6067. Keogh, Barbara K. (U. California, Los Angeles) **The copying ability of young children.** *Educational Research*, 1968(Nov), Vol. 11(1), 43-47.—Administered the Bender Gestalt and Draw-A-Person tests to groups of 8-14 English schoolchildren to provide norms for evaluating performance on these tests when group administered. The 343 5-9 yr. old children were of varied socioeconomic and geographic background and were drawn from 6 state schools in the English Midlands. Generally results are consistent with previously published American norms for individually administered tests, although present scores on the Bender Gestalt are consistently, but insignificantly poorer for all age groups. It is suggested that the finding may be the result of the group administration procedure. Other findings included (a) a significant difference between 8-yr-old boys and girls on the Bender Gestalt, (b) consistently poorer scores by 1 school in the poorest socioeconomic area on the Bender Gestalt, (c) significant correlations between the 2 tests at each age, and (d) demonstration of certain types of errors on the Bender Gestalt which seemed to be typical of various age groups.—*R. Wiltz.*

6068. Martin, Felix. (U. Georgia) **Questioning skills among advantaged and disadvantaged children in first grade.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 617-618.—The evaluation of questioning skills among 1st grade children (100 advantaged and 100 disadvantaged) on the question-asking activity of the Torrance Tests of Creative Thinking utilized an 11-category system of classification for analysis. A comparison of the categories indicate that the disadvantaged Ss seem to be at a lower developmental level of question-asking skills than their advantaged counterparts.—*Journal abstract.*

6069. Very, Philip S. & Iacono, Carmine H. (Rhode Island Col.) **Differential factor structure of seventh grade students.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 239-251.—203 7th graders (107 males, 96 females) from a New England junior high school were tested on the Developmental Battery of Intellective Abilities. The study was designed to investigate the factorial structures of the age differentiation hypothesis. This hypothesis was supported by the following results as predicted: numerical facility and perceptual speed were a single factor at this age level; a purely verbal factor was not found as in college students

but rather a verbal reasoning factor. No inductive reasoning factor was present in the females; general reasoning was not found as expected, and symbolic reasoning in males, estimative ability in males, and arithmetic reasoning in both groups were found as predicted. In general male factors were more differentiated and clearer than those of females; 7 factors were found in males and 5 factors were found in females, which further supports the sex differences predicted. (19 ref.)—*Author abstract.*

6070. Willerman, Lee; Naylor, Alfred F., & Myrianthopoulos, Ntinios C. (U. Michigan) **Intellectual development of children from interracial matings.** *Science*, 1970(Dec), Vol. 170(3964), 1329-1331.—Reports that interracial offspring of 61 white mothers obtained significantly higher IQ scores at 4 yr. of age than interracial offspring of 27 Negro mothers, suggesting that environmental factors play an important role in the lower intellectual performance of Negro children.—*Journal abstract.*

Perception

6071. Abravanel, Eugene. (George Washington U.) **Choice for shape vs. textural matching by young children.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 527-533.—Choice for shape vs. textural matching of stimulus materials by means of active touch was studied intra- and intermodally in 130 preschool children. A significant trend toward matching by shape was present as early as ages 4 and 5 under both intra- and intermodal conditions. This finding is contrary to those of other investigations of preference for shape vs. texture matching and discrimination learning in children. This discrepancy is resolvable in terms of recent evidence on the nature of perceptual activity and exploration by young children which highlights the interaction between stimulus materials and mode of exploration for determining what is perceived. (15 ref.)—*Journal abstract.*

6072. Cohen, S. Alan. (Yeshiva U.) **Studied in visual perception and reading in disadvantaged children.** *Journal of Learning Disabilities*, 1969(Oct), Vol. 2(10), 498-507.—Summarizes findings from a 1st grade study, a secondary school study, clinical studies, and a letter reversals study concerned with perceptual dysfunctions in urban low socioeconomic status children. Results suggest that tests of visual perception are tapping behaviors used to construct IQ tests; therefore, while visual perception training might raise IQ scores, changes in more practical areas do not automatically follow. It is concluded that it is not necessary to teach visual-perceptual-motor behaviors in order to teach disadvantaged underachievers to read, but more attention should be given to spatial orientation of letters both in isolation and in sequences. Critiques by G. N. Getman, C. D. Benton, G. B. Schiffman, and B. Bateman follow the article.—*M. Maney.*

6073. D'Agata, G., Boiardi, A., & Lanzi, G. **La percezione di figure nascoste in soggetti d'età scolare.** [Perception of hidden figures in school age subjects.] *Neuropsichiatria*, 1968(Jan), Vol. 24(1), 51-64.—A positive correlation was found between general intelligence and performance on figure-background discrimination; ($r = +.75$) using a new hidden-figures test developed by the authors.—*L. L'Abate.*

6074. Fatouros, M. & Glick, J. (U. Thessaloniki, Greece) **The influence of identity of objects on**

whiteness constancy. *Ergonomics*, 1970(Jan), Vol. 13(1), 89-91.—Reports an experiment with 32 7- and 11-yr-old boys in 4 groups, investigating whether judgment concerning the relative whiteness of objects is influenced by their degree of similarity, or by their shape. Results indicate that (a) comparisons were better between identical objects, and (b) types of differences between nonidentical objects were not important. (French & German summaries)—*Journal abstract*.

6075. Koetting, James F. (U. Houston, Coll. of Optometry) **Word recognition as a function of locus in the four lateral visual fields: The Iota phenomenon.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Jan), Vol. 47(1), 56-66.—Evaluated performance in each of the 4 lateral visual fields using 3-letter English words. A search was made for observable superiority of word recognition in any 1 of the fields or in their various combinations. Apparatus included a modified stereoscopic viewing device and tachistoscopic mechanism for presenting targets in positions laterally displaced from the point of fixation at a typical reading distance. Ss were 46 5th grade children. A superiority of performance was found in the right binocular field as compared to the left, and in the total field of the left eye as compared to that of the right. Superiority of performance found in the nasal field of the left eye is apparently responsible for these differences. Results support the position that the numerical superiority of nerve fibers servicing a given retinal locus and its associated visual field is not the responsible factor for superior performance in recognizing words, and that a learned postexposural processing of information influenced by the nature of the stimulus-target is involved in what is perceived. A dominance of the left cerebral hemisphere for word recognition and reading is also suggested. (15 ref.)—*Journal abstract*.

6076. McFarland, Richard A. (California State Coll., Fullerton) **Reinforcement in figure-ground perception.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 403-407.—2 parts (faces) of a reversible figure were differentially reinforced by giving S money whenever he was shown 1 of the faces and taking money from him whenever he was shown the other face. Ss were 24 8-12 yr. old children. After reinforcement trials, Ss located the face previously associated with reward reliably more rapidly than the other face. Results indicate that changes in figure perception may be influenced by past histories of reward and punishment associated with the figures.—*Journal abstract*.

Personality

6077. Chiva, A. M., Fontaine, M. A., & Santucci, H. (15 quai Anatole France, Paris, France) **Les mécanismes de contrôle chez l'enfant au test de Rorschach et dans des activités psychomotrices.** [The child's mechanisms of control in the Rorschach and in psychomotor activities.] *Enfance*, 1970(Jan), No. 1, 47-54.—2 groups of 20 and 18 Ss each (median ages = 9.2 and 12½ yr., respectively) were each divided into 2 categories on the basis of their reaction to stress. Group 1 were those who internalized and Group 2 were those who "exteriorized." In the younger age group exteriorizers predominated but in the older group, the proportions of internalizers and exteriorizers were about equal. All Ss were given 3 psychomotor tests and the Rorschach. A general tentative conclusion is that the

behavior and test data are in agreement and that the degree of validity is such that a more extensive study will be undertaken.—S. S. Marzolf.

6078. Eisenman, Russell & Brownstein, Gary M. (Temple U.) **Restriction of emotional release and creativity.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 647-650.—Studied environmental effects on creativity in children, by placing 55 4th graders in 1 of 3 treatment groups: frustration and emotional release, frustration and no emotional release, or control. Changes in fluency and originality were investigated, as well as correlations among these measures and with IQ. Significant results suggest that the frustration may have energized Ss, leading to greater fluency and originality. However, these conclusions are tentative, especially because of little correlation among the measures, in contrast to the finding of R. Eisenman for adults, but similar to the finding of K. G. O'Bryan and R. S. MacArthur who also tested young children and found no originality or fluency factors.—*Journal abstract*.

6079. Eppes, John W. (Emory U.) **The effect of varying the race of the experimenter on the level of aspiration of externally controlled inner city school children.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 912.

6080. Kemmler, Lilly; Windheuser, Heinz J., & Morgenstern, Frieder. (U. Münster, Psychological Inst., W. Germany) **Gruppenanwendung von "Plaget"-Geschichten zum moralischen Urteil bei acht- bis neunjährigen Jungen im Vergleich mit einigen anderen Variablen.** [Group application of Piaget-type stories for the moral judgment in eight- and nine-year-old boys in comparison with some other variables.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(2), 113-124.—Based on Piaget's theory of development of moral judgment in children, a multiple-choice questionnaire was constructed including 12 stories based on Piaget's thinking regarding a number of dimensions, e.g., distributive vs. retributive justice, or attitude towards punishment. The sample consisted of 146 4th grade boys in Germany. Rank-order correlation showed significance (.01) for the total score of the questionnaire as well as for the punishment stories. Correlations with intelligence, school achievement, and perceived responsibility for success and failure were moderate. Significant relations also exist with occupational status of father, i.e., there were higher scores for boys of white-collar workers. No relation to religious confession exists. (English summary) (23 ref.)—R. F. Wagner.

6081. Kreidler, Hans & Kreidler, Shulamith. (Tel Aviv U., Israel) **Dependence of laughter on cognitive strategies.** *Merrill-Palmer Quarterly*, 1970(Apr), Vol. 16(2), 163-177.—Since the absurd is a most potent stimulus for laughter but does not always evoke laughter, it was assumed that facilitatory conditions must be operative in addition to the stimulus. The hypothesis that cognitive strategies play a determining role as facilitatory conditions for laughter was tested by asking 92 5½-yr-old Ss of European and Oriental origin to express their opinion about 15 pictures depicting absurd situations. The results show that laughter and smiling appeared at a significant frequency only when the following cognitive strategies were adopted: identification of the absurd with criticism, or wonder, or mockery. The only inhibiting cognitive strategy was a mere description of details. Nonfacilitatory cognitive

strategies were: irrelevant criticism, a mere statement of theme not noting or identifying the absurd, and those which consisted of active attempts at resolving the absurd on the level of reality, or fantasy, or through denial. (49 ref.)—*R. V. Hamilton.*

6082. Lickona, Thomas. (State U. New York, Albany) **Piaget misunderstood: A critique of the criticisms of his theory of moral development.** *Merrill-Palmer Quarterly*, 1969(Oct), Vol. 15(4), 337-350.—Attempted to "demonstrate that Piaget's ideas about the development of moral judgment have been widely misunderstood and thus, for the most part, inadequately tested. A meaningful overall evaluation of his theory must await the accumulation of research which is based on a clear understanding of his concepts as he presents them. There is at present, little reason for rejecting Piaget's original and persuasive conceptualization of the developmental changes which occur in children's comprehension of morality." (25 ref.)—*R. V. Hamilton.*

6084. Milgram, Norman A.; Shore, Milton F., Riedel, Wolfgang W., & Malasky, Charlotte. (Temple U., Coll. of Education) **Level of aspiration and locus of control in disadvantaged children.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 343-350.—Compared culturally disadvantaged and advantaged 6-yr-old Ss on level of aspiration and locus of control. No differences between disadvantaged Negro and white Ss were found on either measure, but disadvantaged Ss in general were characterized by higher and less accurate levels of aspiration on specific performance tasks and by less internal locus of control.—*Journal abstract.*

Social Behavior

6085. Breyer, Norman L. & May, Jack G. (U. Connecticut) **Effect of sex and race of the observer and model on imitation learning.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 639-646.—Investigated the effects of sex and race of O and model characteristics, verbal, motor and total numbers of imitative responses, within a $2 \times 2 \times 2 \times 2 \times 3 \times 4$ repeated measures design which also assessed the effects of idiosyncratic model effects within each model characteristic. Ss were 96 Negro and white, male and female 60-72 mo. old children. Data collectors were 24 18-26 yr. old adults, representing each race-sex combination. Analysis of the verbal imitation data indicate that Negro females imitated more than Negro males while white males imitated more than white females. Analysis of the motor and total imitation resulted in similar significant effects. In both cases, a significant race of S effect and an interaction effect between race of S, sex of model (M) and exposure trials are reported. An analysis of the motor imitation data yielded a significant race of S by team of model effect and a 4-way interaction between sex of S, sex and race of M, and exposure trials. (17 ref.)—*Journal abstract.*

6086. Bugental, Daphne E., Kaswan, Jaques W., & Love, Leonore R. (U. California, Los Angeles) **Perception of contradictory meanings conveyed by verbal and nonverbal channels.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 647-655.—Acted, videotaped messages containing conflicting

inputs (friendly or unfriendly) in verbal (content), vocal (tone), and visual (facial expression, etc.) channels were shown to 80 5-12 yr. old children and their parents (N = 80). Joking messages (criticisms said with a smile) were interpreted more negatively by children than adults; this age difference was most pronounced for female joking. There was also a general difference in the ratings of conflicting messages from men and women: women were rated as more negative (unfriendly). A linear model was found to be inadequate in accounting for the integration of conflicting messages; a strong interaction was found between verbal and vocal channels (a positive input in 1 channel was discounted if the other channel was negative). (16 ref.)—*Journal abstract.*

6088. Northway, Mary L. (U. Toronto, Inst. of Child Study, Ontario, Canada) **The stability of young children's social relations.** *Educational Research*, 1968(Nov), Vol. 11(1), 54-57.—Reports the results of a long-term study in which 3-choice, 3-criteria sociometric tests were administered twice a yr. to all children enrolled in the Institute of Child Study at a Canadian university. 3 analyses of the sociometric status of children were made: (a) scores from 8 tests for 10 Ss from kindergarten to Grade 3 reveal high correlations between scores at various points on the grade level continuum; (b) over 2000 scores for all Ss between junior nursery and Grade 5 who had taken 2 or more tests indicate that scores between any 2 immediate testing points are highly significantly correlated, and that the level of significance is inversely related to distance between testing points and directly related to age at testing; and (c) analysis of scores from 3 different groups of Ss who attended school with those in their group revealed that although combined scores reflected the general trend, the groups differed considerably from each other in the degree of sociometric stability. It was also found that the degree of stability follows different patterns for girls and boys, with the former being more stable in early years, and the latter being more stable in later years. It is suggested that physiological predisposition, relationships with adults, and early experience in the peer group all play a role in determining social potential.—*R. Wiltz.*

6089. Witt, Peter A. & Gramza, Anthony F. (U. Illinois, Children's Research Center) **Position effects in play equipment preferences of nursery school children.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 431-434.—Studied the position preferences of 4 groups of nursery school Ss (N = 35) in a laboratory playroom. A large and small trestle were interchanged between center and corner positions in a series of play sessions. The frequency with which Ss used trestles in each position was recorded. A significant difference between sessions for 3 groups indicate that the trestle in the center position received more use than the 1 in the corner. Also, the large trestle placed in the center was used more than the small trestle when it was in the center position. The interaction of position and trestle size is noted along with the importance of studying other specifiable parameters affecting a child's use of play equipment.—*Journal abstract.*

Parent-Child & Family Relations

6091. Hore, Terry. (Monash U., Clayton, Victoria, Australia) **Social class differences in some aspects of the nonverbal communication between mother and preschool child.** *Australian Journal of Psychology*, 1970(Apr), Vol. 22(1), 21-27.—Although it has been a common finding that social class differences exist in the use of language, it is not known whether nonverbal communication is also used differentially by different socioeconomic status groups. Videotaped recordings were made of the interactions between 2 divergent SES groups of 15 mothers and their preschool children in 2 situations. Data were analyzed with respect to 3 nonverbal variables. It was found that low SES mothers used more physical contact during a practical task; no difference existed between the SES groups on physical closeness during the tasks; the high SES mother-child pairs exchanged more mutual glances. (24 ref.)—*Journal abstract*.

6092. Osofsky, Joy D. (Syracuse U.) **Situational variability of parental behavior in controlled tasks.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 382-383.

6093. Schecter, David. **El complejo de Edipo: Consideraciones sobre el desarrollo del ego y la interacción parental.** [The oedipal complex: Considerations on ego growth and parental interaction.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1969, No. 11, 25-46.—Examines the appearance and resolution of the oedipal phase of human development from 2 viewpoints: (a) the cognitive-affective development of the child as it advances from a symbiotic social unit of 2 persons toward the interpersonal world, which is essentially oedipal or triangular; and (b) the familial and parental response to this development when oedipal conflicts appear. The solution of oedipal conflicts are considered, exposing the transactional nature of the reciprocal forces upon which depend healthy or pathological resolutions of the oedipal phase. (34 ref.)—*P. Hertzberg*.

6094. Tracy, Michael L. (U. Michigan) **The effect of feedback and information on child rearing styles.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 649.

6095. Troll, Lillian E., Neugarten, Bernice L., & Kraines, Ruth J. (Merrill-Palmer Inst., Detroit, Mich.) **Similarities in values and other personality characteristics in college students and their parents.** *Merrill-Palmer Quarterly*, 1969(Oct), Vol. 15(4), 323-336.—Resemblances were greater in values than in other domains for 100 white college students and the 2 parents of each, with somewhat greater similarities between parent-parent than between parent-child. "There was no evidence of greater resemblance in one than in another of the 4 parent-child dyads: mother-son, mother-daughter, father-son, father-daughter. The resemblances did not seem related to any 1 of 8 characteristics of family structure or family emotional climate, although the findings suggested that general cohesiveness and integration of the family may be of some influence." (31 ref.)—*Journal summary*.

ADOLESCENCE

6096. Belfort, Anne D. (Purdue U.) **Teenager's knowledge and attitudes concerning child-rearing practices related to N variables.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 894-895.

6097. Holmes, M., Nicol, C., & Stubbs, R. (U. London, Inst. of Education, England) **Sex attitudes of young people.** *Educational Research*, 1968(Nov), Vol. 11(1), 38-42.—Surveyed 152 teenagers attending a venereal disease (VD) clinic in London and compared their background to that of cross sections of healthy young people reported in another study. Major findings were that the experimental group, relative to the control group: (a) came from similar normal home backgrounds; (b) disliked school, did poorly in it, and left school early; (c) had similar sex education background; (d) were more sexually experienced; and (e) similarly would have desired more sex education at school. It is concluded that adequacy of sex education in school is not a major factor in preventing the control group from contacting VD, and VD education should be given before age 15 to be useful.—*R. Wiltz*.

6098. Loberg, David E. (U. Nevada) **Adolescent attitudes toward authority.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 826.

6099. Orleans, Edward L. (Illinois Inst. of Technology) **Family interaction personality development and vocational choice in adolescent males.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 919-920.

6100. Propper, Martin M., Klaune, Virginia, & Murray, John B. (St. John's U., Jamaica, N.Y.) **Alienation syndrome among male adolescents in prestige Catholic and public high schools.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 311-315.—Found dimensions of A. Davids' alienation syndrome—egocentricity, distrust, pessimism, anxiety, and resentment—among 40 Catholic parochial high school (CHS) males were comparable to those reported for 80 predominantly Jewish public high school (PHS) males. These dimensions were assessed by projective and direct techniques. CHS showed no significant differences from PHS on all 3 measures but significantly more variability on the direct test. These startling commonalities among adolescent populations differing in social class and religious affiliation present strong evidence that CHSs are not immune to the winds of change sweeping our universities and PHSs. Future research should determine whether these dimensions of alienation represent a normative trend, a transitory phenomena or a deviant aspect of psychological development among modern adolescents. (17 ref.)—*Journal abstract*.

ADULTHOOD & OLD AGE

6101. Harwood, Elsie & Naylor, G. F. (U. Queensland, St. Lucia, Australia) **Rates of information-transfer in elderly subjects.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 127-136.—Assessed the maximum rate of information acceptance (MIA) of approximately 185 60-90 yr. old Ss for 3 perceptual tasks of graded difficulty. Results are compared with those of a control group of 42 young adults. MIA was found to be lower in elderly than in young Ss, and to decline consistently through the 7th, 8th, and 9th decades. The rate of decline was greater with perceptual material of an unfamiliar

nature, and where the information has to be accepted from more than 1 source simultaneously. Although the average performance of elderly Ss was consistently lower than that of younger Ss, the range of scores was such that, except in the most difficult situations, some elderly Ss achieved results well ahead of the younger average. MIA calculated in this manner was closely correlated with the WAIS scaled score totals, and with the subtest totals, especially those in the performance section. The effectiveness of much, if not all, cognitive function may be limited by rate of information acceptance. (14 ref.)—*Journal abstract.*

6102. Kahn, Edwin; Fisher, Charles, & Lieberman, Lois. (Mt. Sinai School of Medicine, New York, N.Y.) **Sleep characteristics of the human aged female.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 274-278.—Studied the sleep of 10 normal 66-87 yr. old women for 4 or 5 nights. The amount of REM sleep was not statistically different from the amount previously reported for the elderly male. The elderly male had significantly more 1st NREM periods shorter than 45 min. than the elderly female. This may reflect slight brain changes in the male not yet evident for the female. As previously reported for the male, REM sleep was quite markedly reduced in the oldest female S of this sample. (23 ref.)—*Journal summary.*

6104. Sheppard, Harold L. (Ed.) **Toward an industrial gerontology: An introduction to a new field of applied research and service.** Cambridge, Mass.: Schenkman, 1970. viii, 165 p. \$7.95.—A collection of papers by various authors based on proceedings of a 1968 seminar of the National Council on the Aging, covering the problems of employment faced by the aging. Topics covered include various aspects of industrial gerontology, training of older workers, achievement motivation, age discrimination, and applied research and attitudinal change.

6105. Spitzer, Esther P. (Alfred Adler Inst., New York, N.Y.) **Disengagement: Self-preservation or self-defense? Voices: The Art & Science of Psychotherapy**, 1969-1970(Win), Vol. 5(4), 28-32.—Disengagement as a way of life is "tantamount to slow spiritual suicide." Social rejection of the elderly is seen as causing a vicious cycle in that, feeling rejected, these aging, in turn, reject society. It is believed that wasting their talent, wisdom, and experience marks one of the tragedies of our society. Day care centers for elderly persons are considered to have helped in preventing movement towards spiritual suicide among other things. The need is to learn that an old person can still manifest some degree of capability.—S. R. Greenwald.

SOCIAL PSYCHOLOGY

6106. Gaylin, Willard. (Columbia Psychoanalytic Clinic, New York, N.Y.) **In the service of their country: War resisters in prison.** New York, N.Y.: Viking, 1970. vi, 344 p. \$6.95.

6107. Irving, Jeffrey J. (U. Kansas) **Subject's expectancy and need for social approval in the Rosenthal experimenter effect paradigm.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 898-899.

6108. McGrath, Joseph E. (Ed.) (U. Illinois) **Social and psychological factors in stress.** New York, N.Y.: Holt, Rinehart, & Winston, 1970. xi, 352 p.

6109. Petrovskii, A. V. **O nekotorykh problemakh sotsial'no-psikhologicheskikh issledovaniy.** [On some problems of socio-psychological investigations.] *Voprosy Psikhologii*, 1970(Jul), Vol. 16(4), 3-12.—While there was considerable interest in social psychology in the 1st 10-15 yr. of Soviet psychology, it soon ceased to exist as a branch of psychology, to be revived only in the early 1960s. It has undergone accelerated development since then. Soviet social psychology comprises the areas of mass communication, attitudes, small group processes, special group processes (family, work groups), and social-psychological aspects of personality. The concept of conformity is analyzed to show that research topics in Western psychology cannot be taken uncritically and applied to Soviet realities. The opposite of conformity, for instance, is not nonconformity but collectivism. The difference arises out of different models of personality accepted by Western and Soviet psychologists. The main task of Soviet social psychology is to give teachers reliable methods of psychological analysis of personality and of children's groups. (English summary)—L. Zusne.

CULTURE & SOCIAL PROCESSES

6111. Berry, John W. (Queen's U., Kingston, Ontario, Canada) **Ecology and socialization as factors in figural assimilation and the resolution of binocular rivalry.** *International Journal of Psychology*, 1969, Vol. 4(4), 271-280.—2 distinct relationships could facilitate handling of data in the area of culture and personality. A direct relationship, based upon unique sensory ecology of various cultural groups, parallels laboratory studies relating frequency of prior exposure and perceptual response. An indirect relationship obtains in perceptual responses mediated by social, personality, and developmental factors. Temne, Scot, and Eskimo Ss yielded data supporting the proposed distinct relationships. In 1 investigation, Ss drew what they saw after tachistoscopic presentations of 9 stimuli. In a 2nd investigation, Ss reported what they saw when materials from their own and different cultures were presented stereoscopically, under conditions productive of binocular rivalry. Further investigations could decide whether all perceptual problems can be handled by means of the relationships described. (27 ref.)—S. E. Gavin.

6112. Bochner, Stephen. (U. New South Wales, Sydney, Australia) **The Honolulu Workshop-Conference on psychological problems in changing societies.** *Australian Psychologist*, 1969(Mar), Vol. 3(3), 158-162.—Presents the background and format of, and research proposals presented at a 1968 conference aimed at stimulating genuine cross-cultural research in the behavioral sciences with special emphasis on social change and changing value systems. Plans for the future are also discussed, including a project to set up a local network of social scientists interested in cross-cultural research to channel information and coordinate regional and multinational research projects.—M. Maney.

6113. Ezekiel, Raphael S. (U. Michigan) **Setting and**

the emergence of competence during adult socialization: Working at home vs. working "Out there." *Merrill-Palmer Quarterly*, 1969(Oct), Vol. 15(4), 389-396.—Q-sorts, retrieval of tape-recorded, lengthy, job-centered, semistructured interviews with Ghana-based Peace Corps secondary school teachers enabled outside judges, unfamiliar with the author's hypothesis, to determine the following item sets to be most saliently descriptive of group members: (a) committed to carrying out his job as Peace Corps teacher to best of his ability; (b) is, all-in-all, a good, competent teacher; (c) satisfied with his teaching performance; (d) experiences of success or effectiveness have predominated over ones of failure or ineffectiveness; (e) generally self-confident; and (f) a genuinely dependable and responsible person. Discussed also are overseas freedoms and constraints: freedoms resting in the nature of the job, and constraint in the structure in the volunteer's setting.—*R. V. Hamilton.*

6114. Farris, George F. (Massachusetts Inst. of Technology) Toward a non-experimental method for causal analyses of social phenomena. *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 259-276.—Describes a method for detecting causal relationships among social phenomena in the natural setting. Based primarily upon obtaining an association between 2 factors, 1 measured earlier in time than the other, and controlling the influences of outside factors, it considers causality to be a matter of degree and allows for symmetrical causal relationships. A study of organizational behavior demonstrates the applicability of the method. After contrasting the method to path analysis and panel-study analysis, it is suggested that behavioral scientists think in terms of 3 levels of research on complex cycles of social behavior: 1-point-in-time correlations to determine general associations among factors, methods like the one proposed here to determine general causal relationships, and, when possible, experiments to determine more precisely the causal relationships among factors of particular interest. (34 ref.)—*Journal abstract.*

6115. Gilula, Marshall F. & Daniels, David N. (Stanford U., Medical School) Violence and man's struggle to adapt. *Science*, 1969(Apr), Vol. 164(3878), 396-405.—Analyzes violence from the view of adaptation theory. Adaptation is examined in light of 3 theories of aggression: (a) biological-instinctual, (b) frustration, and (c) social learning. Violence is viewed as a form of coping behavior employed despite its "maladaptive and destructive results." Examples of violence on the American scene include the recent wave of assassinations, violence in the mass media, resistance to gun control legislation, and mental illness and homicide. (57 ref.)—*P. McMillan.*

6116. Guthrie, Robert V. (Ed.) (San Diego Mesa Coll.) *Encounter: Issues of human concern*. Menlo Park, Calif.: Cummings, 1970. 306 p. \$3.95(paper). Discusses critical issues foremost in student consciousness, while showing the intimate ties between the dynamism of the present and the vitality of the expanding fields of psychology. Topics covered by various authors include personality, behavior, and attitude, the question of normality, displaced reactions, youth and protest, addictive reactions in drugs, and the role of psychology.

6117. Meeker, Barbara F. (U. Washington) Experimental study of cooperation and competition in West Africa. *International Journal of Psychology*, 1970,

Vol. 5(1), 11-19.—Prisoner's Dilemma and a Maximizing Difference game (in which a noncooperative choice may result in an outcome that provides S with a higher score than his opponent, but which nonetheless lowers his absolute score) were applied to adult tribal Africans of varying degrees of Westernization. Westernized Ss showed less cooperation than traditional Ss in the Prisoner's Dilemma but not in the Maximizing Difference game. Traditional and Westernized Ss manifested greater similarity to their partners in the Maximizing Difference game than in the Prisoner's Dilemma game. Results lead to appraising individualism-conformity as a very important dimension, to concluding that several dimensions are involved simultaneously, and to contending that results depend on the structure of the situation in which interaction occurs. (French abstract)—*S. E. Gavin.*

6118. Serpell, Robert. (U. Zambia, Lusaka) The influence of language, education and culture on attentional preference between colour and form. *International Journal of Psychology*, 1969, Vol. 4(3), 183-194.—Preference for form over color occurs with increasing age. Results with respect to education appear scantily documented and self-contradictory. Deaf children tend to show greater preference for color over form. Studies with small (though not with large) samples yield sex differences, with boys responding significantly more to form than to color. Boys described as lively reveal more color responses than quiet ones; adult schizophrenics show a high degree of color preference relative to other groups. In the reported research, Zambian Ss (N = 48 6.7-15.6 yr. olds) showed greater attentional preference for color, relative to Western-educated Ss (N = 16 3-8.5 yr. olds) even when codability was equivalent. Western-type education, with its emphasis upon abstract, geometrical form, may produce perceptual experience that differentiates the groups. (French abstract) (37 ref.)—*S. E. Gavin.*

6119. Slater, Philip E. (Brandeis U.) The pursuit of loneliness: American culture at the breaking point. Boston, Mass.: Beacon Press, 1970. xiii, 154 p. \$7.50.

6120. Wilkenfeld, Jonathan. (Indiana U.) Some further findings regarding the domestic and foreign conflict behavior of nations. *Journal of Peace Research*, 1969, No. 2, 147-156.—Deals with deficiencies regarding the method by which indicators were compiled and raw scores were used in a previous study by J. Wilkenfeld (see PA, Vol. 42 9670) which hypothesized that "within certain groups of nations, classified according to type of nation, there is a tendency for domestic and foreign conflict behavior to co-occur, or for the occurrence of one to be followed in time by the occurrence of the other." A partial replication incorporating changes in analysis is reported. Results which confirmed the hypothesized relationships when type of nation, types of conflict, and specific time lags were controlled, paralleled those found in the original study. The small size of the correlation coefficients, however, indicate that much of the variance in foreign conflict on the basis of domestic conflict and vice versa has not yet been explained.—*M. Maney.*

Ethnology

6121. Pierce, Chester M. (Harvard U.) Violence and counterviolence: The need for a children's domestic exchange. *American Journal of Orthopsychiatry*,

1969(Jul), Vol. 39(4), 553-568.—Reexamines the definition of black violence and analyzes the many forms of white violence. The suicide analogy is used to understand the current stage of black counterviolence, and a remedy is proposed that conforms to the "living law" habits of the American people. (16 ref.)—*Journal abstract*.

6122. Poussaint, Alvin F. & Atkinson, Carolyn O. (Tufts U., Medical School) **Negro youth and psychological motivation.** *Journal of Negro Education*, 1968(Sum), Vol. 37(3), 241-251.—Explores internal and external factors of motivation relevant to Negro youth, and their relationships to behavior. It is argued that society fosters a negative self-image among Negroes, impedes self-assertion and aggressiveness, and fails to develop educational aspirations in the schools. It is suggested that "major structural changes" are needed in American society to remedy this situation. (17 ref.)—*S. Appelle*.

Social Structure & Social Role

6123. Fromm, Erich & Maccoby, Michael. **Conceptos y métodos de la psicología social psicoanalítica.** [Concepts and methods of psychoanalytic social psychology.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1969, No. 11, 3-24.—Discusses the problem of character as 1 of the important variants in the transition from agricultural to industrial production. The character structure of the Mexican farmer and his capacity for change is emphasized. Certain questions, pertinent for all agriculturally based societies, are considered: (a) the character of the farmer in relation to psychological and social forces, (b) the possibilities of change in this character with the aim of adapting to an industrial economy, and (c) conditions which facilitate or hinder such a change. Traditional character traits of farmers, i.e., individualism, conservatism, orderliness, parsimony, and brusqueness are analyzed. It is suggested that sociopsychological analytic categories can be applied to social investigation by using an interpretive questionnaire to obtain data which can be statistically structured.—*P. Hertzberg*.

6124. Maida, Peter R. (Pennsylvania State U.) **The relationship of risk-taking and future orientations of persons in a rural Pennsylvania low-income area.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 837.

6125. Schwendiman, Gary; Larsen, Knud S., & Dunn, Freeman. (Marshall U.) **Social position, social desirability and self-esteem.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 117-118.—Welfare clients occupy a position of low desirability, whereas college students, by reason of familial ties or prospective future contribution, occupy a position of high desirability. Significant differences were obtained between these 2 groups (N = 48 and 51, respectively) on self-esteem. Length of time on welfare was a significant factor in welfare clients' self-esteem.—*Journal abstract*.

6126. Shapiro, Joan. (St. Luke's Hosp. Center, Div. of Community Psychiatry, New York, N.Y.) **Dominant leaders among slum hotel residents.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 644-650.—Examined the problem of indigenous leadership among poor minority groups. Observations were presented about 3 40-55 yr. old Negroes who were all on welfare and who emerged as dominant leaders among

slum hotel inhabitants in New York City. A recurrent pattern existing in these slum hotels is a matriarchal quasi-family pattern. These 3 matriarchal leaders fulfilled several basic needs: (a) direct oral gratification, (b) control of disruptive behavior, and (c) assurance of group support of the individual. The functions of the dominant leader are somewhat similar to those performed by mental health workers in bridging the vast gap between the single, poor, and sick person and the services to which he is entitled.—*A. M. Berg*.

6127. Tannenbaum, Abraham J. (Teachers Coll., Columbia U.) **Some non-intellectual concomitants of social deprivation.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 9-30.—Reviews social and psychological considerations of social deprivation emphasizing the necessity of viewing these 2 phenomena as facilitating and reinforcing each other. Popular myths regarding the nature, causes, and cures of social deprivation are pointed out, as is the fact that neither social nor behavior therapy is presently adequate to explain the determinants of poverty. Likewise, neither psychology nor sociotherapy, as currently practiced, seems successful in ameliorating it. It is suggested that the main effects of environmental and personal factors in producing the deprivation syndrome are considerably weaker than is often supposed. An interaction hypothesis involving both external and internal factors is proposed. (31 ref.)—*Journal abstract*.

Religion

6128. Beech, Lawrence A. (York U.) **The California Psychological Inventory as a measurement of permissiveness-restrictiveness and love-hostility.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 381-382.—Administered the CPI and an objective self-report inventory to 66 Protestant ministers. Styles of authority reflected on the subscales for love-hostility and permissiveness-restrictiveness indicate greater hostility but a close congruence on the permissive-restrictive dimension when compared with self-reported styles of authority in pastoral counseling by Ss.—*Journal abstract*.

Cross Cultural Comparison

6129. Beloff, Hella & Paton, Xenia. (U. Edinburg, Scotland) **Bronfenbrenner's moral dilemmas in Britain: Children, their peers and their parents.** *International Journal of Psychology*, 1970, Vol. 5(1), 27-32.—30 conflict situations involving relative influence of peers and parents upon socialization make up the Moral Dilemmas Test. Comparing American with Soviet children, Soviet efforts to ally peer-power with adult goals of character training appear successful, reflected in the Soviets' higher general level of moral responses. 274 British 12 yr. olds, from subsamples distributed geographically, socioeconomically, and in educational philosophy, constituted the present sample. While British children scored close to American norms, autonomy and individuality appeared more marked among the British. Ss from boarding and conventional schools scored higher than those from socially equivalent day and progressive schools. Unanswered limitations involve generalizability to real life and developmental differentials that may confuse comparisons. Results yield promise for the Moral Dilemmas Test and technique. (French abstract)—*S. E. Gavin*.

6130. Berrien, F. Kenneth. (Rutgers State U.) **Familiarity, mirror imaging and social desirability in stereotypes: Japanese vs. Americans.** *International Journal of Psychology*, 1969, Vol. 4(3), 207-215.—240 males and 240 females constituting Japanese and Hawaiian samples were compared with 225 males and 118 females from the United States on judgments of national groups based upon items from the EPPS. Even with social desirability partialled out, Japanese see Americans as more contrasting with themselves than appears for American Ss who compare themselves with Japanese. The Hawaiian sample falls in between the other samples. Data suggest that the strain-toward-consistency theories, derived largely from Western cultures, may not be applicable to Oriental respondents. "Further analyses of cognitive mechanisms in various cultures may lead to important revisions in these theories and may also have a bearing on international bargaining styles." (French abstract) (15 ref.)—S. E. Gavin.

6131. Berrien, F. Kenneth. (Rutgers State U.) **Super-ego for cross-cultural research.** *International Journal of Psychology*, 1970, Vol. 5(1), 33-39.—Ideal cross-cultural research satisfies a number of conditions. It engages collaborative efforts of investigators from different countries, each of whom is encouraged and supported by institutions in their respective countries. It addresses researchable problems of common concern as well as key social problems. It begins with the joint definition of problems and adoption of comparable methods. The "pool" of data is owned jointly by collaborators free to report their interpretations to their constituents but obligated to strive for interpretations acceptable to a world community of scholars. Cross-cultural studies are important for cross-checking hypotheses. Only by testing samples representative of humanity worldwide, can fundamental principles of psychology be achieved. (French abstract)—S. E. Gavin.

6132. Brislin, Richard W. (Pennsylvania State U.) **Back-translation for cross-cultural research.** *Dissemination Abstracts International*, 1970(Aug), Vol. 31(2-B), 895.

6133. Chartier, George M. & Sundberg, Norman D. (U. Oregon) **Commonality of word listing, predictability, originality and chunking: An analysis of American and Indian ninth graders.** *International Journal of Psychology*, 1969, Vol. 4(3), 195-205.—Indian Ss of varied socioeconomic status from 3 communities in northern India manifested significantly greater variability in word-naming commonality than appeared among American Ss. This finding runs counter to the conception of American individuality as opposed to Indian group orientation. American Ss mentioned significantly more children than adults in a word-naming task, while the reverse held for Indian Ss. This finding supports the interpretation of greater peer orientation among Americans than among Indians. Girls in American but not Indian groups gave more identical words than did boys. No relationships appeared between commonality, predictability, and originality. Further study could cast light upon which aspects of language or environment or both produce the marked similarities between cultural groups. (French abstract) (26 ref.)—S. E. Gavin.

6134. Cüceloglu, D. M. (U. Illinois) **Perception of facial expressions in three different cultures.** *Ergonomics*, 1970(Jan), Vol. 13(1), 93-100.—60 abstract facial expressions created by the use of 4 eyebrow, 3 eye, and 5

mouth types were rated on 40 emotion-name scales. These scales were constructed for each of 3 national groups (20 American, 20 Japanese, and 20 Turkish male undergraduates), within their respective languages. By factor analysis 3 cross-cultural bipolar dimensions which accounted for 72.4% of the total variance were found and labeled pleasantness, irritation, and nonreceptivity. Analysis of the components of the faces representing the 2 poles of each dimension revealed considerable similarity between the language groups, but also some differences. (French & German summaries)—*Journal abstract*.

6135. Gordon, Leonard V. & Kikuchi, Akio. (State U. New York, School of Education, Albany) **Response sets of Japanese and American students.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 143-148.—The School Environment Preference Schedule, a 24-item scale employing a 5-choice Likert response format and designed to measure the bureaucratic personality at the school level, was administered in the original and in translation to counterpart student samples in the United States and Japan. The extremeness response set was equal in strength and contribution to scale variance in both cultures. However, the Japanese were decidedly more prone to use the neutral or "undecided" category. Implications of response set differences for cross-cultural opinion and attitude research are discussed.—*Author abstract*.

6136. Hess, Robert D. & Minturn, Leigh. (Stanford U.) **Authority, rules and aggression: A cross-national study of the socialization of children into compliance systems.** *International Journal of Psychology*, 1969, Vol. 4(4), 307-316.—Danish, Greek, Italian, Indian, Japanese, and American 4th, 6th, and 8th graders of 2 socioeconomic levels (determined by paternal occupation and place of residence) participated in a study focusing on development of behavior related to authority figures and to rules and laws designed to govern the behavior of members of social systems. The study emphasized authority figures with whom children have face-to-face contact. "Compliance" referred to complex response patterns developed in dealing with regulations and authority figures, while allowing for some degree of self-direction. 3 instruments, including a questionnaire, a response (by ratings) to a series of pictures projected on a screen, and a peer nomination form (designed to distinguish between aggression toward peers and aggression or noncompliance toward teachers), were employed. A sample of Ss from each country experienced interviews designed to elicit responses relevant to concepts on which the study was based. Data for each of the participating nations contributed to a report submitted to the United States Office of Education. (31 ref.)—S. E. Gavin.

6137. Okonji, Michael O. (Makerere University Coll., Kampala, Uganda) **The differential effects of rural and urban upbringing on the development of cognitive styles.** *International Journal of Psychology*, 1969, Vol. 4(4), 293-305.—208 adult and adolescent volunteers from Ibusa and the University of Nigeria individually took the Children's Embedded Figures Test, Rod and Frame Test, and Embedded Figures Test. Results show undergraduates reared in urban literate homes to be significantly more field-independent than their counterparts reared in rural illiterate homes. Performance on the Embedded Figures Test, while in the expected direction, does not yield differences between groups that

approach statistical significance. University of Nigeria rural males are significantly more field-dependent than are New York females. Urban males show greater field-independence than the New York females on the Rod and Frame Test. Results support the view that cultural factors are most important in developing visual perceptual field-independence. Further studies could determine whether American studies on personality correlates in perceptual field-independence can be generalized across cultures. (27 ref.)—S. E. Gavin.

6138. Pepitone, Albert, et al. (U. Pennsylvania) **Justice in choice behavior: A cross-cultural analysis.** *International Journal of Psychology*, 1970, Vol. 5(1), 1-10.—Choice behavior in games such as the Prisoner's Dilemma reveals Americans as maximizing gains when self-estimate was high, while Italians maximized gains when self-estimate was low. The present study manipulated ethical values through dispensing initial just or unjust reward, followed by a game in which monetary rewards depended upon which of 4 joint choices occurred in a standard "payoff" matrix. American Ss initially rewarded on the basis of stated merit tended to retain that position in the game. They appeared to believe the stated differences in ability and to act accordingly. In contrast, Italian Ss showed a tendency to equalize payoff for both Ss under such circumstances. Both Americans and Italians tended to reduce inequity in the game when 1 member was arbitrarily rewarded initially. Data are open to varied interpretations. (French abstract)—S. E. Gavin.

6139. San Diego, Ellinor A., Foley, Jeanne M., & Walker, Ronald E. (Devereux School, Goleta, Calif.) **WAIS scores for highly educated young adults from the Philippines and the United States.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 511-515.—Administered the WAIS to 30 bilingual Philippine and 30 American male and female Ss. The average Ss tested had more than 17 yr. of education. 14 2×2 analyses of variance for national origin and sex were performed on the 11 subtest scores and 3 IQ measures. The American group scored higher than the Philippine group on all variables except Digit Symbol and significantly higher on 9 of these. However, both groups scored significantly higher on Verbal than on Performance IQ. The main effect for sex was significant for only 1 variable. Findings are discussed in relation to the literature on cross-cultural studies of adult intelligence.—*Journal abstract.*

6140. Sistrunk, Frank & Clement, David E. (U. South Florida) **Cross-cultural comparisons of the conforming behavior of college students.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 273-274.—Compared the conforming behavior of college students in Brazil and the United States. A mixed-effects factorial analysis of variance design was employed with between-Ss variables of S nationality, S sex, and influence nationality, and with task difficulty operating as a within-Ss variable. The results demonstrated greater conformity with greater task difficulty, and greater conformity by the Brazilians than by the Americans. Examination of interactive effects showed further that there was a reversal in the tendency of Brazilian males and females to respond to influence, with the males conforming more to American sources and the females conforming more to the sources of their own nationality.—*Author abstract.*

6141. Smart, Mollie S. & Smart, Russell C. (U. Rhode Island) **Self-esteem and social-personal orientation**

of Indian 12- and 18-year-olds. *Psychological Reports*, 1970(Aug), Vol. 27(1), 107-115.—Obtained measures of self-ideal congruence and of social-personal orientation in Delhi from groups of 50 Indian males and females of about age 12 and 18, predominantly of socioeconomic Class I. Data were compared with longitudinal American data obtained by R. Carlson. Among the preadolescents, the average self-ideal congruence score for the Indian girls was highest, followed by Indian boys, American girls and boys. Only the differences involving the Indian girls were statistically significant. At age 18 the average female congruence score was insignificantly above the average male score. In social-personal orientation, over $\frac{1}{2}$ of the Indian preadolescent and adolescent girls were socially oriented. About $\frac{1}{4}$ of the Indian preadolescent boys were socially oriented; almost $\frac{1}{2}$ of the older boys were. In contrast, the American girls had changed from $\frac{1}{4}$ socially oriented to over $\frac{1}{2}$; the American boys had changed from almost $\frac{1}{2}$ to approximately $\frac{1}{4}$.—*Journal abstract.*

6142. Taylor, D. M., Dagot, E. P., & Gardner, R. C. (Philippine Normal Coll. Language Study Center, Manila) **The use of the semantic differential in cross-cultural research.** *Philippine Journal of Psychology*, 1969(Jun), Vol. 2(1), 43-51.—2 groups of English-Tagalog bilinguals rated each of 8 ethnic group labels on the same 48 semantic differential scales. 102 responded in English while a 2nd group of 111 Ss was administered an identical form of the scales prepared in Tagalog by means of a back-translation procedure. Results indicate that there was moderate agreement between the factor structures of the ratings on both forms of the scales. In terms of responses on individual scales it seemed clear that the Ss who responded in their native language (Tagalog) were more willing to express themselves evaluatively than those Ss who made their ratings on the English form. (16 ref.)—*Journal abstract.*

6143. Thiagarajan, K. M. & Deep, Samuel D. (Management Inst. for Training & Research in Asia, Madurai, India) **A study of supervisor-subordinate influence and satisfaction in four cultures.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 173-180.—A total of 446 middle managers in 4 countries—Belgium, Italy, England, and the United States—were administered Exercise Supervise in their own languages within the context of management development programs. In Exercise Supervise the managers role-played 3 styles of supervision and 3 styles of subordinate behavior. Findings tended to be consistent in all 4 countries in that the authoritarian supervisor was more influential and less satisfying than the democratic supervisor, and that the involved subordinate was more influential than the passive subordinate. Much less consistent were results on supervisors' satisfaction with various subordinate styles, and the relationship between influence on a counterpart (supervisor or subordinate) and satisfaction with that counterpart. (15 ref.)—*Author abstract.*

6144. Wohl, Julian; Horowitz, Irwin A., Tapingkae, Amnuay, & Pardthaisong, Thieng. (U. Toledo) **Some personality characteristics of Thai and American university students.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 45-46.—Utilized the Test of Social Insight (TSI) for a cross-cultural comparison of American and Thai university students. Data indicate that Thai Ss (N = 280) scored significantly higher on the withdrawal, passivity, competitiveness, and aggressivity subscales of the TSI than American Ss (N = 239). American ex-

hibited significantly greater cooperative tendencies than Thai Ss. Interpretative problems due to translation techniques, use of multiple t tests, and the structure of the TSI are discussed.—*Journal abstract.*

Family

6145. Forbes, Gordon B. (Millikin U.) **Fraternity or sorority membership and birth order: Sex differences and problems of reliability.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 277-278.—Reports 2 studies of the relationship between birth order and fraternity or sorority memberships. In Exp. I, no relationship was found for males, but more only-born and 1st-born females were found to join sororities. In Exp. II, no relationship was found for females but more 1st-born and last-born males were found to join fraternities. These results are not consistent with other findings. They suggest that the nature of the relationship is influenced by sex differences and the relationship may change across S populations.—*Author abstract.*

6146. Harder, Jean M. (Columbia U.) **Self-actualization, mood, and personality adjustment in married women.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 897-898.

6147. Jacobson, Gary & Ryder, Robert G. (Harvard Medical School, Boston, Mass.) **Parental loss and some characteristics of the early marriage relationship.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 779-787.—Studied people who had experienced the final disruption of a previous fundamental relationship through the death of a parent in the 1st few yr. of their marriage. Ss were 90 couples with a history of parental loss prior to marriage and 30 couples with no history of parental loss. Results contribute to the understanding not only of pathological issues in marriage, i.e., the inability to maintain trust or resolve anger, but also of nonpathological issues, i.e., interpersonal closeness.—*Journal abstract.*

6148. Rappaport, Alan F., Payne, David, & Steinmann, Anne. (U. Connecticut) **Marriage as a factor in the dyadic perception of the female sex role.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 283-284.—Evaluated the concepts of man's ideal woman and woman's ideal woman for 45 married and 45 dating couples drawn from a university community. Responses on the Inventory of Female Values indicate that married couples did not have more male-female consensus that did the dating couples for either concept. For both married and dating couples the discrepancy focused on the issue of what a man looks for in a woman.—*Journal abstract.*

6149. Treichel, Bruce & Nance, Dale. (U. Wisconsin, Milwaukee) **Attitudes by young adults toward child rearing and presumed attitudes of their own parents.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 191-194.—57 undergraduates performed a Q-sort of 50 items of possible concern in child rearing and a 2nd sorting based on presumed attitudes of their own parents. Significant differences were obtained between Ss' self-sorts and sorts for their parents; certain nonsignificant sex differences are also noted.—*Journal abstract.*

6150. Zussman, Shirley. (Columbia U.) **A study of certain social, psychological, and cultural factors influencing husbands' participation in their wives' labor.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 387-388.

Social Change & Social Programs

6151. Cox, Fred M., Erlich, John L., Rothman, Jack, & Tropman, John E. (Eds.) (U. Michigan) **Strategies of community organization: A book of readings.** Itasca, Ill.: F. E. Peacock, 1970. xiii, 393 p.

6152. Pospiszyl, Kazimierz. **Psychologiczna i społeczna geneza agresywnego zachowania się współczesnej młodzieży.** [Psychological and social genesis of aggressive behavior of contemporary youth.] *Studia Socjologiczne*, 1970, Vol. 2(37), 215-230.—Examines the premise that the generation gap is the result of differences between the aims of society and the needs of youth. A review of American and European psychological literature supports the basic thesis but does not provide definite suggestions as to its prevention. It is suggested that in Poland the conflict between generations is reduced by the early infusion of Marxist idealism in the life of the child making the goals of society and needs of youth highly similar. (42 ref.)—*H. Kaczkowski.*

6153. Prugh, Dane G. (U. Colorado Medical Center) **Youth's challenge and our response: Are we a sick society?** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 548-552.—Postulates that society if "seriously conflicted, currently torn, and temporarily faltering in its coping capacities" and that the core problem is "the imbalance between our rapid technological advances and our relative lack of progress in interpersonal relations." It is felt that the youth are "reasserting the dignity of individual human beings and the importance of human values" by demanding different priorities. It is concluded that new mechanisms for communication and shared responsibility are needed.—*G. Steele.*

SEXUAL BEHAVIOR

6154. Bartell, Gilbert D. (Northern Illinois U.) **Group sex among the mid-Americans.** *Journal of Sex Research*, 1970(May), Vol. 6(2), 113-130.—As a participant O the author interviewed a selected sample of mid-western and southwestern white, suburban couples, and singles engaged in group sexual activities. The methods of acquiring partners for sexual exchange and the sociocultural characteristics of the informants are discussed. A brief sociopsychological analysis of the research discusses the general sexual excitement and an increased sexual interest in the mate or partner as the positive aspects of swinging; and inability to live up to one's own psychosexual myth and self-illusions, personal jealousy, and discovery as some of the negative aspects. It is felt that the individuals interviewed are not benefiting themselves because the ideals that led them into group sex have not been fully realized and reflect mechanical interaction rather than intimate human relationships.—*E. B. Jaffa.*

6155. Denfeld, Duane & Gordon, Michael. (U. Connecticut) **The sociology of mate swapping: Or the family that swings together clings together.** *Journal of Sex Research*, 1970(May), Vol. 6(2), 85-100.—Discusses mate swapping or swinging as an institutionalized form of extramarital sexual behavior in American society. The advantages of mate swapping are considered as a solution to the problems of marital sexual monotony. A definition of swinging, characteristics of the swingers, extent of swinging, and locating potential partners are discussed. The sociological model which is supported by empirical research views swinging as a

strategy to revitalize marriage. The model considers the rules of swinging within the context of the family. (28 ref.)—*E. B. Jaffa*.

6156. O'Neill, George C. & O'Neill, Nena. (New School for Social Research) **Patterns in group sexual activity.** *Journal of Sex Research*, 1970(May), Vol. 6(2), 101-112.—Provides definitions of "group sex," "partner exchange," and "swinging." Data based on depth interviews were obtained from a sample of 50 middle-class business and professional people. Major topics discussed are the themes and patterns of group sexual activity, selection and changing of partners, varieties of sexual interaction, contraception, disease, and the use of drugs and alcohol. Discussed also are 4 phases which reflect fluctuating attitudes towards participation in group sexual activities. No follow-up interviews are reported, however, speculation and questions for future research are presented.—*E. B. Jaffa*.

6157. Smith, James R. & Smith, Lynn G. (U. California, Berkeley) **Co-marital sex and the sexual freedom movement.** *Journal of Sex Research*, 1970(May), Vol. 6(2), 131-142.—The informants were members in a sexual freedom movement in the San Francisco Bay area and/or attended some kind of sexually liberal activity. The phrase "co-marital sexual relations" is proposed to refer "to married couples who are either involved together in establishing sexual relationships beyond the marital dyad or to couples in which there is both knowledge of and consent to such relationships regardless of whether the sexual activity includes both partners or is independent." Sociological characteristics of this subculture are discussed. Several of the myths regarding sexual behavior are considered: attendance at sex parties guarantees participation; participation is a priori evidence of a perverse, neurotic, and/or pathological disposition; and the necessity of sexual monogamy as a component in the marriage relationship.—*E. B. Jaffa*.

Birth Control & Abortion

6158. Harkavy, Oscar & Maier, John. (Ford Foundation, New York, N.Y.) **Research in reproductive biology and contraceptive technology: Present status and needs for the future.** *Family Planning Perspectives*, 1970(Jun), Vol. 2(3), 3-18.—Reviews current information on contraception in light of the need for expanding "the base of fundamental knowledge to support continually improving contraceptive technology." Effectiveness and health related side effects for intrauterine devices, oral contraceptives, and other hormonal contraceptives are summarized. Additional new procedures and devices are listed and briefly described, including male chemosterilants, postcoital pill, and luteolytic compounds, etc. Basic research needs, funding patterns, and centers of research and training in reproductive biology are summarized. The need for increasing present levels of funding to provide effective fertility regulation programs throughout the world is emphasized.—*P. McMillan*.

6159. Hawkins, Charles H. (Central Washington State Coll.) **The erotic significance of contraceptive methods.** *Journal of Sex Research*, 1970(May), Vol. 6(2), 143-157.—Studied erotic liberty, i.e., "the absence of obstacles or complications to sexual interaction entailed in a contraceptive method." Information was gathered from the scientific literature and interviews of young

married persons. Contraceptive barriers are classified and ordered by their relative balance between the erotic role and the contraceptive role. Timing practices are classified and ordered by the length of the infertile period. Both barriers and timing practices are ranked in terms of contraceptive and erotic liberty. Major hypotheses supported are the greater the erotic liberty of a contraceptive method, the more satisfied the user will be, the more frequently the couple will make love, the higher their consensus will be; and number of children is inversely related to erotic liberty. Interviews, scientific literature, and the dimension of erotic liberty support the conclusion that an implicit erotic significance in all contraceptive methods exists. (30 ref.)—*E. B. Jaffa*.

6160. Lamm, Richard D., Downing, Sam, & Heller, Abraham. (Democratic member of the Colorado House of Representatives, Denver) **The legislative process in changing therapeutic abortion laws: The Colorado experience.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 684-690.—Examines the successful progress of a liberalized law through the legislature of Colorado. Colorado was the 1st of a growing number of states to pass abortion law reform. It was found that generally community opinion has changed. "In the case of abortion, as with birth control, the prevailing attitude is toward liberalization of existing laws and mores."—*A. M. Berg*.

6161. Tietze, Christopher & Lewit, Sarah. **Abortion.** *Scientific American*, 1969(Jan), Vol. 220(1), 21-27.—Reports information from countries where abortion is legal as a basis for evaluating the "pros and cons of the practice." Results of an opinion survey in the United States comparing responses to the same questions concerning attitudes toward abortion in 1967 and in 1965 show an increase in liberal attitudes. Data are also presented comparing abortion and birthrates for such countries as Hungary, Czechoslovakia, and Japan. It is concluded that the United States, especially the state legislatures, should draw on experiences from other countries for developing solutions to the problem.—*P. McMillan*.

ATTITUDES & OPINIONS

6162. Anderson, D. S. & Western, J. S. (Australian National U., Canberra, Australian Capital Territory) **Attitudes of students entering professional faculties.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 291-299.—Tested 2817 students entering courses in engineering, law, medicine, and teaching in 4 Australian universities with a specially devised attitude inventory. Scores were obtained for: intellectual interests, academic activities, political-economic liberalism, social liberalism, pragmatism, dogmatism, and cynicism. 7 analyses of variance, using the scale scores as dependent variables, revealed significant effects due to faculty, university, and interaction. Faculty differences which were the most numerous, and occurred with every scale, were considered in the context of a study of professional socialization.—*Journal abstract*.

6163. Berry, J. W. (Queen's U., Kingston, Ontario, Canada) **The stereotypes of Australian states.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 227-233.—Administered a state stereotype questionnaire to 266 1st-yr psychology students in all 6 states. There was sufficient uniformity and interstate agreement in the ascription of adjectives to warrant the use of the term

stereotype. Good agreement was noted between content of state and national stereotypes and previously published views. Differences in the uniformity of stereotyping and being stereotyped were shown to be significantly related to a state's weight or combined rank on area and population within Australia.—*Journal abstract.*

6164. **Beswick, D. G. & Hills, M. D.** (Australian National U., Canberra, Australian Capital Territory) **An Australian Ethnocentrism Scale.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 211-225.—Devised an ethnocentrism scale by selecting 32 items according to their power of discrimination between criterion groups of Ss and their internal consistency in a pilot study of 192 Ss. The original pool of items was set up to comply with various facets of ethnocentrism as defined by D. J. Levinson and illustrated in the California E Scale and the British Ethnocentrism Scale. Validity was demonstrated in the main study of 273 Ss by highly significant differences between criterion groups selected according to age, socioeconomic status, student-nonstudent, levels of education, income, religion, and other criteria in accord with the theory and previous findings in Britain and the United States. Partitioning of the main sample revealed the predominance of education as a determinant.—*Journal abstract.*

6165. **Colman, Andrew M. & Lambley, Peter.** (Leicester U., England) **Authoritarianism and race attitudes in South Africa.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 161-164.—Investigated the relationship between authoritarianism and race attitudes in white South African society using a forced-choice F scale, a unidimensional and highly discriminating attitude inventory, and a social distance questionnaire. Ss were 60 white students, and the resulting correlations between authoritarianism and the prejudice measures were found to range from .23 to .33. These results were interpreted as suggesting that in a highly prejudiced society, prejudiced attitudes serve a utilitarian rather than an ego-defensive function for many of its members, and that they are therefore probably more amenable to change.—*Author abstract.*

6166. **Delhees, Karl H., Cattel, Raymond B., & Sweney, Arthur B.** (U. Illinois) **The structure of parents' intrafamilial attitudes and sentiments measured by objective tests and a vector model.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 231-252.—133 parents (50 male, 83 female) were tested on the 24 attitudes of the adult, parental version of the new Family Motivation Test (FAMT). 4 matrices of data (1 of mothers and 1 of fathers on both integrated and unintegrated measures) resulted in the following oblique factors: pugnacity-aggression, assertion, protectiveness, sex-sensuality, fear, gregariousness, and sentiment factors related to spouse and child. A vector model of interpersonal relations is outlined. (51 ref.)—*Author abstract.*

6167. **Hall, Ralph F.** (U. Sydney, New South Wales, Australia) **An application of unfolding theory to the measurement of attitudes.** *Educational & Psychological Measurement*, 1970(Fal), Vol. 30(3), 621-637.—Measured the attitudes toward church of 1st-yr psychology students individually using the paired-comparison method. Instructors were to agree (prefer personally) or to judge (compare stimuli). Order of presentation of pairs was varied. Goodness of fit was tested for both judgment and preference data according to the comparative judgment and choice axiom models. Both models fit the judgment

data; neither fit the preference data after Trial 1. Using the unfolding technique, preference data were more satisfactorily explained in 2 dimensions than in 1. The dimensions were tentatively named favorableness-unfavorableness and liberalism-dogmatism.—*N. M. Chansky.*

6168. **Koulack, David.** (U. Manitoba, Winnipeg, Canada) **A test of social judgment theory using an interval scale.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 275-276.—Social judgment theory suggests that Ss holding extreme positions on a social issue would have smaller latitudes of acceptance, larger latitudes of rejection, and smaller latitudes of noncommitment than Ss holding moderate positions. Earlier studies reported conflicting results for the latitude of noncommitment. The present study (N = 1482 undergraduates) utilized an interval scale to examine the relative latitude sizes. The results were consistent with social judgment theory and it was suggested that some of the inconsistencies found in earlier studies might be a function of initial scale construction.—*Author abstract.*

6169. **Lambley, Peter & Gilbert, Lester H.** (U. Cape Town, South Africa) **Forced-choice and counterbalanced versions of the F Scale: Prediction of prejudiced attitudes.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 547-550.—Investigated the predictive power of counterbalanced and forced-choice formats of the California F Scale in an experiment using 106 undergraduates. In earlier studies, the predictive criterion was generally reflected in correlations of either format with S's responses on the original F Scale. Here, the criterion measures were scores on prejudice scales. Results support the view offered by L. H. Strickland and W. P. Janicki, i.e., that the counterbalanced format measures an acquiescent style. Findings indicate, however, that the forced-choice format is a better predictor when senior student samples are used.—*Journal abstract.*

6170. **Leidy, T. R., Erlick, A. C., Karasick, B., & Smart, B.** **High school students look at the 1968 Presidential election.** *Purdue Opinion Panel Poll Report*, 1968(Nov), Vol. 28(1), 1-20.—To determine high school student's opinions on major issues of the 1968 Presidential election, questionnaires were administered to over 13,000 students. Results based on a stratified sample of 2000 questionnaires reveal that (a) the proportion of students following the election "very closely" (11%), "somewhat closely" (53%), and "hardly at all" (35%) is approximately the same as in 1964; (b) students, particularly those closely following the election, think that the public should have more say in the selection of candidates; (c) 64% believe that the voting age should be lowered, as compared with 32% in 1964; and (d) 39% preferred Nixon as President, while 29% preferred Humphrey and 22% preferred Wallace. It was also found that students who perform well on a "Current Events Quiz" section of the questionnaire, as compared to those who perform poorly, are more likely to (a) believe that the Vietnam war will end in a truce, (b) believe that the public should have more say in the selection of candidates, (c) follow political conventions and speeches, and (d) believe that election results should only be reported after the polls close. An appendix provides a complete analysis of responses to each item in the questionnaire.—*R. Wiltz.*

6171. **Lester, David.** (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Re-examination of Middleton's data: Sex differences in death attitudes.** *Psychological*

Reports, 1970(Aug), Vol. 27(1), 136.—Reports the results of a statistical analysis of W. C. Middleton's data on attitudes of college students toward death. His data was drawn from questionnaire responses of 488 females and 337 males 15-27 yr. old and reported no sex differences in attitudes. Chi square analysis revealed that men were more likely to think about, but had less negative affective reaction to, death and dying.—*M. West*.

6172. Lubalin, James S. (U. Michigan) **The effects of counterattitudinal improvisation on attitudes: An exploration of mediating processes.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 827.

6173. McConochie, William A. (Illinois Inst. of Technology) **Comparison of traditional attitude measuring techniques with a new technique.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 901.

6174. Meyer, Henry J., Likwak, Eugene, & Warren, Donald. (U. Michigan, School of Social Work) **Occupational and class differences in social values: A comparison of teachers and social workers.** *Sociology of Education*, 1968(Sum), Vol. 41(3), 263-281.—It is suggested that the teachers and social workers differed in their relation to their clientele with the teacher having more authority over children than the social workers over their adult clients. Teachers customarily worked in a more monocratic bureaucratic organization than the social workers. The teacher's task was to transmit more or less standard and accepted forms of knowledge and values, whereas social workers were attempting to change personality and values where change was not clearly legitimated. To demonstrate that such differences may lead to differences in values, it is shown that there was an overall difference in values between the 2 professions: (a) where schools were experimentally altered to social work type structures, the teachers were more likely to have social work values, and (b) when ordinary schools were divided into 2 groups—1 of which resembled social work goals and structures (i.e., elementary vs. secondary)—the teachers were more likely to hold social work values. There was a contextual school building effect so that minority members adopted values of majority members in the building.—*Journal abstract*.

6175. Rudin, Lawrence A. & Harless, Marion D. (Midwestern U.) **Graffiti and building use: The 1968 election.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 517-518.—Tested the view that graffiti are (a) related to current social topics, and (b) specific to college building use. Contrary to previous findings, graffiti collected from a small southwestern college at national election time, 1968, did not show a preponderance of items related to important social issues, the election or Vietnam. The graffiti likewise were not specific to building use.—*Journal abstract*.

6176. Schwendiman, Gary; Larsen, Knud S., & Cope, Stephen C. (Marshall U.) **Authoritarian traits as predictors of candidate preference in 1968 United States Presidential election.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 629-630.—Investigated the relation of candidate preference during the 1968 Presidential election to scores on 4 measures of authoritarianism. A survey was administered to a random sample of 141 male and 141 female undergraduates. Significant differences between Wallace supporters and supporters of other candidates on 3 of the 4 measures indicate that general authoritarianism, in addition to right-wing authoritarianism, is predictive of candidate preference. Sex

differences were reported on only 1 of the 4 assessments, and age correlated inversely with all measures.—*Journal abstract*.

6177. Ward, Charles D. (U. Maryland) **Length of attitude statements as an indicator of attitude.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 398.—Obtained measurements of attitude toward Negroes from 316 undergraduates. Each S wrote the most anti- and pro-Negro attitude statements he could imagine. It was found that pro-Negro Ss wrote longer pro- than anti-Negro attitude statements; they also wrote longer pro-Negro attitude statements than did anti-Negro Ss. Results indicate that communication length may be useful as an indirect indicator of attitude.—*Author abstract*.

Formation & Change

6178. Brehm, Jack W. & Jones, Russell A. (Duke U.) **The effect on dissonance of surprise consequences.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 420-431.—Suggested and tested the hypothesis that the magnitude of dissonance aroused by a commitment will be reduced or increased by subsequent, unexpected, positive and negative consequences, respectively. Under the guise of consumer research, 77 female undergraduate Ss chose between 2 attractive long playing records. Some of the Ss were forewarned that by selecting the right record they could also win 2 free movie tickets, while other Ss were not forewarned. After the choice, $\frac{1}{2}$ of the forewarned and $\frac{1}{2}$ of the unforewarned Ss learned that they had won 2 free movie tickets by their selection of a record, while the other $\frac{1}{2}$ learned that they had not won the 2 free tickets by their selection. A control condition without mention of tickets established the amount of dissonance reduction from the choice per se. A measure of change in attractiveness of the records from before and after the choice indicate that the magnitude of dissonance was affected by winning or not winning the tickets only when Ss were forewarned. It is concluded that surprise consequences probably do not affect the magnitude of preexistent dissonance and that "felt responsibility" for consequences may be an appropriate concept for understanding the relevant evidence.—*Journal abstract*.

6179. Charley, Beverly H. (U. Nevada) **The effectiveness of Negro teachers for changing developing racial attitudes in young children.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 824.

6180. Dawson, John L. (U. Hong Kong, China) **Attitude change and conflict among Australian aborigines.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 101-116.—Studied the effects of urbanization on aboriginal attitude change and unresolved attitudinal conflict using 3 aboriginal samples selected for varying degrees of exposure to modern influences. These were a semitraditional Arunta sample, a semimodern Wallaga Lake sample, and a modern Sydney sample. The study was carried out in terms of traditional vs. Western (T-W) attitude consistency theory. An aboriginal version of the T-W scale was developed to test the main hypotheses which were generally confirmed. It is concluded that the extremely permissive aboriginal socialization process and lack of political stratification has tended to limit the degree of acceptance of modern attitudes and values and may also tend to influence levels of achievement motivation.—*Journal abstract*.

6181. Dittes, James E. (Yale U.) **On the need for control in persuasive scientific communications.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 672.—Responds to an evaluation by E. Levonian (see PA, Vol. 45:Issue 4) to studies by H. F. Gollob and J. E. Dittes (see PA, Vol. 39:15095) on the need for control data in personality-persuasibility studies. It is suggested that the criticism was (a) based on measures different from those employed by Gollob and Dittes, and (b) used an opinion issue where stray communications were likely to occur during the test period.—P. McMillan.

6182. Gollob, Harry F. (U. Denver) **More comment on need for control in studies of persuasibility.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 678.—Suggests that E. Levonian (see PA, Vol. 45:Issue 4) has not defended his initial position that H. F. Gollob and J. E. Dittes (see PA, Vol. 39:15095) should have used a control group of Ss who were exposed to opinion measures but not exposed to the communication. It is argued that a vague feeling that a given variable might provide a "basis" for generating an unspecified alternative hypothesis is not sufficient reason to insist that the variable be controlled.—Author abstract.

6183. Larsen, Knud S., Schwendiman, Gary, & Stimpson, David V. (Brigham Young U.) **Change in attitude toward Negroes resulting from exposure to congruent and non-congruent attitudinal objects.** *Journal of Peace Research*, 1969, No. 2, 157-161.—Tested the efficacy of cognitive dissonance theory in predicting attitude change, and made a conceptual differentiation between stereotypes and attitudes. 185 undergraduates filled out Negro stereotypes and chauvinistic nationalism scales and, depending on their scores, were assigned to groups exposed to negative or positive interview with a Negro confederate. Results support the cognitive dissonance theory, but fail to support the conceptual distinction between stereotypes and attitudes.—Author abstract.

6184. Levonian, Edward. (U. California, Los Angeles) **Comment on "Reply to Levonian."** *Psychological Reports*, 1970(Oct), Vol. 27(2), 589-590.—Discusses I. Silverman's objections to evidence cited by E. Levonian (see PA, Vol. 45:Issue 4) to support his argument on the need for control data in studies of self-esteem and persuasibility. It is suggested that the 1st and 4th objections are based on erroneous claims, while the 2nd and 3rd are based on spurious arguments.—Journal abstract.

6185. Levonian, Edward. (U. California, Los Angeles) **Comment of Dittes' note.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 673-674.—E. Levonian (see PA, Vol. 45:Issue 4) criticized some previous studies in self-esteem and persuasibility for failing to use control data to test hypotheses alternative to the research hypothesis. The criticized studies included that of H. F. Gollob and J. E. Dittes (see PA, Vol. 39:15095). J. E. Dittes (see PA, Vol. 45:Issue 4) objects to this inclusion, apparently on the grounds that the Gollob and Dittes study, being "relatively more sophisticated," virtually precludes an alternative interpretation. An alternative interpretation is offered. Bases for additional alternative hypotheses which seem reasonable are suggested.—Journal abstract.

6186. Levonian, Edward. (U. California, Los Angeles) **Need for control data in studies of self-esteem and persuasibility.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 527-544.—Describes 9 studies involving self-

esteem and persuasibility following exposure to a mass communication, none of which made proper use of control data. This failure leaves unresolved the validity of interpretations which are reasonably alternative to that which supports the research hypothesis. 4 of the studies are discussed in detail to exemplify the range of interpretations which may be considered alternative to those which support research hypothesis. The need for control data in this research area is discussed in the more general context of the purpose of control data.—Journal abstract.

6187. Linder, Darwyn E. & Worchel, Stephen. (Duke U.) **Opinion change as a result of effortfully drawing a counterattitudinal conclusion.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 432-448.—Tested the hypothesis, derived from dissonance theory, that the more effort Ss exerted to attain the conclusion to a syllogistic argument the more they would come to agree with that conclusion. 3 experimentally manipulated levels of effort were created by varying the number of preliminary syllogisms 93 undergraduates had to solve in addition to finding the conclusion to the final set of premises, the assertion that cigarette smoking causes lung cancer. 2 levels of commitment to the belief that cigarette smoking does not cause lung cancer were defined by dividing Ss into those who smoked and those who did not. Attitude change scores indicate that the amount of effort expended was directly related to the amount of attitude change for smokers, but that nonsmokers in the 3 effort conditions did not differ in the amount of attitude change evinced. Data are interpreted as the result of dissonance reducing effort justification, but several alternative explanations are discussed. (22 ref.)—Journal abstract.

6188. Silverman, Irwin. (U. Florida) **Reply to Levonian.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 545-546.—Considers that E. Levonian's (see PA, Vol. 45:Issue 4) analysis of deficiencies in control procedures in self-esteem—persuasibility studies is relevant to several but not to the majority of the studies he reviews.—Journal abstract.

Influence & Behavior

6189. Levin, Jack & Black, Harvey. (Northeastern U.) **Personal appearance as a reflection of social attitudes: Stereotype or reality?** *Psychological Reports*, 1970(Aug), Vol. 27(1), 338.—Administered Kerlinger's 26-item Social Attitudes scale to 91 male and 102 female undergraduates. Responses were trichotomized into right-wing, moderate, and left-wing categories. Each S was independently rated on a 7-point semantic differential type scale of personal appearance for "hip" to "straight." Right-wing Ss were found straighter in appearance than moderates; moderates were rated as straighter than left wingers; and females were judged straighter than their male counterparts. Findings "suggest that both personal appearance and social attitudes can be regarded as dimensions of a fundamental orientation to social change."—M. West.

GROUP & INTERPERSONAL PROCESSES

6191. De Koning, Thomas L. (U. Michigan) **Interviewer and respondent interaction in the household survey interview.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 824.
6192. Doob, Anthony N. (U. Toronto, Ontario, Canada) **Catharsis and aggression: The effect of hurting one's enemy.** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 291-296.—82 undergraduates were either annoyed by a confederate of the E or left alone. S then tested the confederate on a learning task. Instructions were varied so that for $\frac{1}{2}$ of the Ss, the confederate lost some or all of the money he was to receive as payment for participating in the experiment; for the other $\frac{1}{2}$ of the Ss, there was no mention of money. All Ss were then given an opportunity to give electric shocks to the confederate. Ss in the annoy conditions gave shorter shocks when the confederate had lost money. The confederate's losing money had no effect on the duration of the shocks the Ss delivered when the S had not been annoyed. (15 ref.)—*Journal abstract*.
6193. Dustin, David S. & Polihronakis, Charles T. (State University Coll. New York, Plattsburgh) **Team bias in a card contest.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 558.—Previous studies have indicated that in the laboratory, "team competition members tend to evaluate their own team product more favorably than that of the competing team." To test whether similar bias exists in a real competition, 44 undergraduates, who had just finished the 1st match of a card contest, predicted the score if they played the same team again. All winning teams and 3 of the 4 losing teams predicted their own success.—P. McMillan.

6198. Libby, William L. (Ohio State U.) **Eye contact and direction of looking as stable individual differences.** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 303-312.—Identified 4 ocular responses by an interviewee to specific questions: (a) maintaining eye contact, (b) breaking eye contact before completion of question, (c) direction of look-aways at or after end of question—up vs. down, and (d) direction of look-away—right vs. left. In 52 male and 52 female undergraduates, each response proved markedly reliable in terms of inter-O agreement, intra-S stability, and temporal stability. Directional responses were more frequent—Ss tending to look up rather than down, left rather than right. Ss with more social experience and women tended more to maintain eye contact. Implications of directional responses for personality assessment in face-to-face communication are suggested. (15 ref.)—*Journal abstract*.
6199. Mehrabian, Albert. (U. California, Los Angeles) **Some determinants of affiliation and conformity.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 19-29.—Tested 5 sets of hypotheses relating to affiliative and conformity behaviors. All measures obtained from undergraduate Ss (Exp. I, N = 95; Exp. II, N = 90) were based on verbal questionnaires, and multiple regression analyses were used to test the hypotheses. In Exp. I with moderately familiar targets whose status or attitudes only were known, affiliative behavior correlated with a personality measure of affiliative tendency, and conformity behavior correlated with sensitivity to rejection. Attitude discrepancy, and to a lesser extent status discrepancy, implied less reinforcing quality of an unfamiliar target, and therefore less desire to affiliate with or conform to him. Increasing attitude discrepancy with a target was a greater deterrent of affiliation for those who were more sensitive to rejection. Due to the positive connotations of higher status, among targets of equally discrepant status, those who were of higher status elicited more affiliation and conformity than those who were lower in status. Dependency and affiliative tendency both correlated with the increase in desire to affiliate when fearful. There were no such correlations when anticipating more positive experiences. In Exp. II among familiar targets, the positively reinforcing ones were liked more and the negatively reinforcing ones were liked less. Positively reinforcing Ss elicited more affiliation and conformity, but conformity was also a function of status.—*Journal abstract*.
6200. Pate, James L. & Broughton, Elizabeth. (Georgia State U.) **Game-playing behavior as a function of incentive.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 36.—Assessed the correspondence between behavior and predictions from game theory in 2-person 0-sum strategy games as a function of incentive in 3 groups of 5 Ss each. Incentives were a valueless counter, imaginary money, and real money. Performance showed no systematic change across trials and did not differ for the 3 groups.—M. West.

6206. Stassen, Maurice & Marturano, Edna M. (Dept. Psicologia da FFCL, Ribeirão Preto, Brazil) **A influência da limitação e da ponderação das escolhas e das rejeições sobre o status sociométrico.** [The influence of the limitation and the weighting of the choices and the rejections on the sociometric status.] *Revista de Psicologia Normal e Patológica*, 1968(Jul), Vol. 14(3-4), 135-146.—Tested the hypothesis that the limitation and the weighting of the choices and rejections emitted in a sociometric test put a significant influence on the sociometric status of the members of a group. Freidman's 2-way analysis of variance applied to results obtained from 6 7th grade classes did not confirm the hypothesis, however, it appeared that the statistical test may have been weak. The status obtained from 40% of Ss varied according to the use of 1 notation manner or another. Regarding the problem of which notation manner is best, it is suggested that the one which gives the larger number of neutral status is best. MacNemar's test of significant differences was used to compare 4 notation manners in this aspect. It is concluded that notation manners based on a uniform quotation of choices and rejections are in best accordance with this requirement. (French summary)—*English summary*.

6207. Strümpfer, D. J. (U. Port Elizabeth, South Africa) **Fear and affiliation during a disaster.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 263-268.—Questionnaire data, collected from 161 adults after a flood, showed significant positive interrelationships between fear, affiliative tendencies (both actual and preference), and severity of threat. 1st-born Ss reported higher fear than later-born Ss; affiliation did not show this association, possibly as a result of chance age differences between 1st and later born. Indications were found that older Ss show higher affiliation than younger Ss. Women reported more fear and more affiliation than men.—*Journal summary*.

6208. Thomanek, Erich K. (U. Illinois) **Some aspects of reciprocity.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 905.

6209. Tomeković, Tomislav. (U. Belgrade, Yugoslavia) **An evaluation of some theories related to human choice.** *Studia Psychologica*, 1970, Vol. 12(2), 89-98.—Discusses the causes of liking a person and choosing him as a friend or coworker. Past research has shown few conclusive results, but does indicate that similar personality plays some role in the choice of a person for future contacts. An individual's behavior at his job, his performance, participation in the group's life, accepted values, and interests mediate interpersonal interaction. Theories of interpersonal relationships by various authors are discussed. (Czech & Russian summaries) (56 ref.)—*Journal abstract*.

6211. Walker, Martha & Holbert, William. (U. Tennessee) **Perceived acceptance and helpfulness in a marathon group.** *Psychological Reports*, 1970(Aug),

Vol. 27(1), 83-90.—Used 2 means of exploring what happened in 1 group marathon (N = 15). Several statements can be made about the results: (a) change occurred during the 24-hr marathon in group structure as well as relationships within that structure; (b) change was most evident in the mean population of the group—those persons seen as above or below chance at the onset—not the "extremes"—the leader or the unchosen; (c) acceptance in a group, as measured by a target sociogram, was not achieved by psychological helpfulness, as measured by the postmarathon evaluation questionnaire; (d) aggression-confrontation was not perceived as being as important a parameter as empathic identification or acceptance-warmth; (e) the statement: "I was least helpful..." elicited a high response from the participants on the aggression-confrontation dimension and the "write-in" dimension; and (f) profiles of helpfulness given, helpfulness received, least helpfulness given, and least helpfulness received differ markedly on the 5 dimensions of psychological helpfulness perceived by the group.—*Journal abstract*.

6212. Wilke, H. & Lanzetta, John T. (Dartmouth Coll.) **The obligation to help: The effects of amount of prior help on subsequent helping behavior.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 488-493.—Studied the effect of prior help, over a wide range of values, on subsequent helping behavior. Ss were 44 undergraduate males randomly assigned to the 0, 20, 40, 60, 80, and 100% prior help conditions. The amount of reciprocated help was shown to be a monotonic increasing function of the amount of prior help. Results are consistent with social exchange theories. Possible limitations of the experimental situation used are discussed.—*Journal abstract*.

Influence & Communication

6213. Ajzen, Icek. (U. Illinois) **Prediction and change of behavior in the Prisoner's Dilemma.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 923.

6214. Ajzen, Icek & Fishbein, Martin. (U. Illinois) **The prediction of behavior from attitudinal and normative variables.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 466-487.—Tested M. Fishbein's extension of D. E. Dulany's theory of propositional control in the context of the Prisoner's Dilemma (PD) game. The theory holds that a person's behavior (B) is a function of his behavior intention (BI) which is determined by his attitude toward the act (A-act) and by his beliefs about the expectations of the other player, i.e., social normative beliefs (NBs). 2 PD games differing in Cooperation Index (CI) were each played in a cooperative, a competitive, and an individualistic motivational orientation. 16 groups, 8 male and 8 female, were assigned to each of the 3 motivational conditions. CI and motivational orientations affected questionnaire measures of the theoretical constructs and game behavior as expected. Their influence on B was mediated by BI through A-act and NBs. BI correlated highly with B and was in turn accurately predicted from A-act and NBs in a multiple-regression equation. The relative importance of A-act and NBs in predicting BI and B varied as expected with the motivational orientation: in the cooperative condition norms were relatively more important; under competition more relative weight was placed on A-act. (24 ref.)—*Journal abstract*.

6215. **Chammah, Albert M.** (U. Michigan) **Sex differences, strategy and communication in a mixed-motive game.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 925-926.

6216. **Christensen, Larry.** (Texas A & M U.) **Person perception accuracy as a function of ethnic group and familiarity.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 510.—32 white and 15 black judges made predictions of self-ratings under maximum and minimum information conditions for 4 targets, 1 black and 1 white of each sex. Analysis of the computed accuracy scores indicate that targets differ in the ease with which they are perceived, increased familiarity increases accuracy, and accuracy of perception is a function of the race of both the judge and the target.—*Author abstract.*

6217. **de Morales, Florence.** **Aspectos de las discusiones en grupo.** [Aspects of group discussions.] *Revista de Psicología*, 1968, Vol. 13(1-2), 115-122.—Proposes a general scheme on the nature, function, and problems of a discussion situation. Group discussion is defined and its objectives are outlined. Specific functions of discussion are elaborated: (a) the transmission of information, (b) the study of the problem and preparation of decisions, (c) reaching a decision, (d) pedagogical function, (e) psychosociological function, (f) therapeutic function, and (g) investigative function. 3 necessary activities of a group discussion which include the production, facilitation, and regulation of the discussion are elaborated. The distribution of activities is also outlined, noting the different types of possible gathering: conversational, cooperative, gatherings centering around a problem, and gatherings centering around the group.—*P. Hertzberg.*

6218. **Fulton, R. Barry.** (U.S. Information Agency, Karachi, Pakistan) **The measurement of speaker credibility.** *Journal of Communication*, 1970(Sep), Vol. 20(3), 270-279.—5 dimensions of personality—agreeableness, conscientiousness, culture, extroversion, and emotional stability—were varied and measured in investigating speaker credibility. A measure of attraction was correlated against S's response ($N = 246$ undergraduates) to 2 speakers representing opposite poles of a dimension. The resulting correlation of .65 is taken to represent the dimension of credibility. A subsequent study measuring credibility of 1968 Presidential candidates was used for validation purposes.—*P. Federman.*

6219. **Johnson, David W. & Dustin, Richard.** (U. Minnesota) **The initiation of cooperation through role reversal.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 193-203.—Examined the effectiveness of a cooperatively oriented negotiator who is highly skilled in role reversal in inducing cooperation in an adversary. The experiment consisted of 2 stages, the induction of the negotiating positions and the negotiations between the S and a confederate of the Es. In the negotiations, confederates used role reversal to initiate cooperation, while Ss were given either an individualistic or a competitive orientation and negotiated without role reversal. With the expectation that their positions were incompatible, Ss negotiated in 2 situations, 1 where the positions were incompatible and 1 where the positions were actually compatible. More agreements were reached in a shorter period of time in the individualistic than in the competitive conditions. (15 ref.)—*Journal summary.*

6220. **Meininger, J. V.** **Das Verhalten:** [Behavior.]

Psychiatria, Neurologia, Neurochirurgia, 1969(Sep), Vol. 72(5), 429-437.—Behavior of a human being is the expression and the self-realization of a free subject, by means of a complicated system of physical and chemical reactions. Understanding of human behavior is only possible in a process of verbal communication, in which the movements, attitudes, gestures, words, and actions of a person are interpreted and given a meaning. (German summary)—*English summary.*

6221. **O'Brien, Gordon E.** (Flinders U., School of Social Sciences, Bedford Park, Australia) **Group structure and the measurement of potential leader influence.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 277-289.—Critically reviews F. E. Fiedler's contingency model of leadership and presents a more general method of measuring potential influence available to a leader which involves the use of a matrix representing group structure. The use of this index is illustrated in a study dealing with the effect of group structure on productivity. It is concluded that this method has advantages over previous methods in that: (a) a large number of group relationships may be used, (b) it takes into account the totality of relationships in a group, and (c) it measures potential influence with precision even in large complex groups. (29 ref.)—*M. Maney.*

6222. **Pine, Lawrence D. & Stone, LeRoy A.** (U. North Dakota) **Scaling of subjective credibility: A prothetic continuum.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 295-305.—To determine the scalability of a subjective credibility dimension pertaining to psychometric test-item statements and also whether such a judgmental dimension could be classified as being metathetic or prothetic, 39 undergraduate judges made magnitude estimations of the subjective credibility of items on the Opinions about Mental Illness Scale with respect to a standard item statement (modulus value = 50). Ss were randomly divided into 2 groups with respect to the magnitude-estimation task, 1 group presented with a reversed order of stimuli. Each S also made category scale judgments of the stimuli on a 5-point credibility category scale. The judgmental credibility continuum possessed high intrascale and interscale reliability. With such high reliability, item statements can be legitimately scaled with respect to a subjective credibility judgmental dimension. The judgmental continuum was considered to be prothetic based on 2 criteria, a concave downward relationship between the category and magnitude-estimation scales and a positive relationship between judgmental variability and subjective magnitude. (20 ref.)—*Journal abstract.*

6223. **Probasco, Preston D.** (U. Wisconsin) **Social feedback factors in vocal shadowing.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 828-829.

6224. **Schneider, Benjamin.** (Yale U.) **Relationships between various criteria of leadership in small groups.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 253-261.—Each of 240 male undergraduates were assigned to 1 of 48 5-man groups. Results obtained with 3 methods of measuring 3 functional roles in initially leaderless small groups were factor analyzed. 3 resultant dimensions were defined by the measures of peer, self, and O judgments and not by the functional roles being judged. A 4th measure, gross amount of verbal interaction was shown to be most highly related to O, next to peer, and least to self-ratings. A measure of general

satisfaction was shown to be only marginally related to functional role-taking. Results are discussed in terms of role differentiation and on implications of generalizing results obtained through 1 measurement procedure to those obtained with other procedures. (18 ref.)—*Journal summary*.

6225. Singh, Uday P. (Bhagalpur U., Bihar, India) **Sex and age differences in persuasibility.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 269-270.—Investigated differences in susceptibility to persuasive communications due to sex and age. 30 female and 30 male 20-23 yr. old Ss participated. All were Hindus, spoke the Hindi language, and were enrolled in the postgraduate classes. Females were more persuasive than males of the same age group. A consistent decline in persuasibility score with increasing age was also observed for the 2 groups. However, the amount of decrease in the case of males was not as high as that in females.—*Author abstract*.

6226. Tesser, Abraham. (U. Georgia) **Some effects of stimulus typicality in an impression formation task.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 159-164.—Hypothesized that the greater the number of people who could be described with a particular trait the less "information" in that trait and, hence, the less weight it would be given in an impression formation list. 187 adjectives previously scaled for likeability were scaled for information. 8 impression formation lists were formed by systematically varying 2 blocks of selected adjectives/list with respect to order, likeability, and information. 96 undergraduates served as Ss. Males conformed to the information hypothesis on change in impression and on over-all impression especially with respect to the information content of the positive adjectives ($p < .05$). Females did not conform to the hypothesis. A significant ($p < .001$) recency effect was obtained.—*Journal abstract*.

6227. Wicklund, Robert A., Slattum, Valerie, & Solomon, Ellen. (U. Texas) **Effects of implied pressure toward commitment on ratings of choice alternatives.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 449-457.—If an individual has the option of choosing 1 of several alternatives or none at all and is asked to examine and rate the alternatives predecisionally in the presence of a bystander, how are his ratings affected if he knows that the bystander has a vested interest in his choosing an alternative? The following predictions were derived from a theory of psychological reactance: (a) lower predecision ratings of the alternatives will result to the extent that a bystander ostensibly desires that the S commit himself to an alternative, and (b) the effect of the bystander with a vested interest will be greatest given that the S has examined relatively few choice alternatives. Both predictions were confirmed in an experiment with 20 female undergraduates.—*Journal abstract*.

Social Perception & Motivation

6228. Altmann, H. A. & Shymko, D. (U. Calgary, Alberta, Canada) **A study of interpersonal judging accuracy as related to life style.** *Western Psychologist*, 1970(May), Vol. 1(3), 113-116.—Tested 31 graduate students enrolled in a counseling program, using the Barron Complexity scale and the Cline Interpersonal Perception Film Tests. Results indicate (a) no significant difference in interpersonal accuracy scores as a result of

a training experience, (b) no significant difference between interpersonal accuracy scores of counselor trainees and educational administration students, and (c) no significant effect of life style on interpersonal accuracy scores.—*Journal summary*.

6229. Conklin, R. C. & Ogston, D. G. (U. Calgary, Alberta, Canada) **The effect of varying the mode of information on interpersonal judging accuracy.** *Western Psychologist*, 1970(May), Vol. 1(3), 100-105.—Presented the V. B. Cline films to 72 graduate students in 5 groups who (a) were shown the films with sound, (b) were shown the films without sound, (c) heard only the sound track, (d) were presented with minimal information (stereotype), or (e) were not given any relevant information. All groups responded to the tests which follow the Cline films. Results indicate that groups exposed to sound and groups exposed to sight of the films scored higher than the other groups on attentional tests. The initial hypothesis that groups given varying amounts of personal information would do equally well on intuitive tests was only partially supported.—*Journal summary*.

6230. Gardner, R. C., Taylor, D. M., & Santos, Emma. (Philippine Normal Coll., Manila) **Ethnic stereotypes: The role of contact.** *Philippine Journal of Psychology*, 1969(Jun), Vol. 2(1), 11-24.—Proposes an interpretation which considers ethnic stereotypes as inferences about groups made from information obtained. Contact is viewed simply as one way of obtaining information and its role in stereotype change is seen as depending upon the nature of the contact. It is hypothesized that consensus in the stereotype will develop when many members of the stereotyping group share common information about the stereotyped group; heterogeneity of experiences will result in a lack of consensus. This interpretation was supported with data obtained from 2 groups of American teachers. 38 Ss who lived in the Philippines for 9 wk. (contact group), and 30 Ss who did not (no contact group).—*Journal abstract*.

6231. Himmelfarb, Samuel. (U. Massachusetts) **Effects of cue validity differences in weighting information.** *Journal of Mathematical Psychology*, 1970(Oct), Vol. 7(3), 531-539.—Ran 2 experiments to determine how cues varying in validity are combined in categorizing a person. Ss learned the validities of single facial cues and then responded to compounds of the cues. There were 24 undergraduate Ss in Exp. I, and 45 in Exp. II. 3 special cases of a generalized weighted averaging model for combinatorial behavior were examined: a simple averaging model, a cue weighting model, and a complete discounting model. The best fit was provided by the cue weighting model, but the discrepancies from the model indicate that it was not giving sufficient weight to the most valid cue. No evidence for a summation process was obtained in cases of nonconflicting cue compounds.—*Journal abstract*.

6232. Kelley, Harold H. & Stahelski, Anthony J. (U. California, Los Angeles) **The inference of intentions from moves in the Prisoner's Dilemma game.** *Journal of Experimental Social Psychology*, 1970(Oct), Vol. 6(4), 401-419.—After learning the Prisoner's Dilemma game 98 undergraduates who had indicated that their own goal would be cooperative vs. competitive ($N = 49$ in each case) were presented with short sequences of interaction between Players A and B. For each 1, they judged its information value as to A's intention for the relationship, what intention it indicated, etc. These judgments

provided the evidence for testing a series of hypotheses suggested by attribution theory. Support was obtained for the hypothesis that consistent behavior by A yields more information and consensus than does inconsistent behavior. Partial support was found for the hypotheses that (a) consistent disagreement with B yields greater information than consistent agreement, and (b) inconsistency that constitutes an "initiative" or shift away from B yields greater information than inconsistency that constitutes an "imitative" shift toward B. Both were found to be true when A's final action in the sequence was competitive but not when it was cooperative. The hypothesis that competitive behavior, being regarded as less socially desirable and more uncommon, will yield more information than cooperative behavior was not supported. Results are reported on judgments of "acting on principle" and inferences as to A's expectations about B's later moves. Evidence on individual differences in attribution is consistent with the proposition that attributions are made according to the S's experience with internal and external causes of his own behavior.—*Journal abstract.*

6233. Lamberth, John & Craig, Lance. (Purdue U.) **Differential magnitude of reward and magnitude shifts using attitudinal stimuli.** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 281-285.—Based on the assumption that if attitudinal stimuli in a discrimination task are reinforcers, they should bring about other behavioral consequences analogous to more traditional reinforcers, magnitude of reward and shifts in reward magnitude were examined. Personal evaluations were used as large magnitude and neutral statements as small magnitude. Ss were 19 female and 17 male undergraduates. $\frac{1}{2}$ of the Ss in the large and small magnitude groups were shifted to the opposite reward contingency in Phase II of the experiment. As hypothesized, the large magnitude group was performing at a higher rate than the small magnitude group prior to the shift ($p < .01$). When the magnitudes were shifted, the performance of the Ss was reversed ($p < .02$). Results support the reinforcement model of attraction. (16 ref.)—*Journal abstract.*

6235. Naatz, Tilo. (Free U., Inst. of Psychology, Berlin, W. Germany) **Untersuchung zur Lebensraumrepräsentanz der Grösse-Valenz-Verknüpfung: Ein bedingungsanalytischer Beitrag zum Problem der sozialen Wahrnehmung.** [Investigation concerning environmental representation of size-valence linkage: An analytical contribution to the problem of social perception.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(2), 277-295.—Presents a cognitive theory of accentuation not based on processes controlled by specific needs and valences. Preexperimental conditions may determine an associative link between valence and size. Experimental confirmation for the theory was found by testing 2 groups who gave size judgments of objects listed previously as liked or disliked. (English & French summaries) (25 ref.)—*W. J. Koppitz.*

6236. Parducci, Allen. (U. California, Los Angeles) **The relativism of absolute judgments.** *Scientific American*, 1968(Dec), Vol. 219(6), 84-90.—Presents the view that a "universal balance for judgments" must be

rejected. Experiments are presented showing that the rating of misdeeds, by several hundred undergraduates, on a 5-point scale from "not particularly bad" to "extremely evil" were significantly influenced by the context of other statements in which the misdeeds were embedded. The frequency and range principles of making judgments are described and compared. It is noted that the judgment of Ss in a variety of different situations, including various sets of physical stimuli, represent a compromise between the 2 principles. Efforts to apply these principles to everyday decisions and behavior is discussed.—*P. McMillan.*

6237. Rinella, Salvatore; Ferguson, Leonard W., & Sager, Eric B. (Ohio U.) **Personality-impression formation as a function of visual cues and set.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 427-430.—In 2-person simulated employment interviews, 119 blindfolded interviewers perceived interviewees generally the same as did 256 seeing interviewers. In accord with S. E. Asch's hypothesis on the centrality of the cold-warm construct, the effect of the advance set warm is to enhance the frequency with which interviewers select warm-related words as descriptive of interviewees; the effect of the advance set cold is to lower that frequency.—*Journal abstract.*

6238. Sappenfield, Bert R. (U. Montana) **Perceived similarity to self as related to the stereotypically perceived "ideal personality."** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 297-302.—20 male and 18 female undergraduates Q-sorted 60 photographs according to perceived similarity to self and, later, according to perceived resemblance to the ideal personality. In a later quarter, 19 males and 19 females performed the Q-sorts in reverse order. For individual Ss, between-variable r 's had median values of .65-.71, and all but 5 of 76 r 's were significantly positive ($p < .01$). Within-group consensus supported the hypothesized existence of a stereotype of the ideal personality. Across-group r 's between median values of the 2 variables, and between median values on each of these variables and perceived attractiveness (across studies), varied from .77-.85, thus supporting the hypothesis that perceived similarity to self may involve identifying the self with the stereotypical ideal personality. (15 ref.)—*Journal abstract.*

6239. Saral, Tulsu B. (U. Illinois) **A study of the effect of role information on interpretation of facial expressions.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 829-830.

6240. Simon, William E. **Self-concept and the validity of the Allport-Vernon-Lindzey Study of Values.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 263-266.—Investigated the relationship between Ss' perception of their personal values and their values as measured by the Allport-Vernon-Lindzey Study of Values. 79 undergraduate Ss unknowingly completed the Study of Values and later were presented with descriptions of 9 individuals whom they were to rate with respect to similarity to self. The descriptions of 8 of these individuals were the same for all Ss. The 9th individual (individual D) was, on the basis of Ss' scores on the Study of Values, described as having a value system either very similar—high perceived similarity (PS) condition—or very dissimilar to their own. The individual D was rated as significantly more similar to self in the high PS condition.—*Journal abstract.*

COMMUNICATION

6243. **Bois, J. Samuel.** (Viewpoints Inst., Los Angeles, Calif.) **Communication as creative experience.** Los Angeles, Calif.: Viewpoints Inst., 1968. v, 42 p.

6244. **Breger, Ilana.** (New York Student Consultation Center, N.Y.) **Perception of sign language of the deaf.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 426.—30 symbols from the sign-language of the deaf were "signed" to 35 naive sighted-hearing male Ss who correctly identified 26 of them beyond chance expectations. Misidentifications tended to occur in terms of signs with associated, similar, or opposed meanings. The perception of sign language is highly accurate for individuals for whom it has no personally relevant function.—*Author abstract.*

6245. **Crane, Lorea D., Dieker, Richard J., & Brown, Charles T.** (Western Michigan U.) **The physiological response to the communication modes: Reading, listening, writing, speaking, and evaluating.** *Journal of Communication*, 1970(Sep), Vol. 20(3), 231-240.—30 male and 33 female college students were used in a 3 × 5 factorial design experiment. 3 classes of stimuli were used—personal, pleasant, and aversive words. The 5 treatment conditions were reading, listening, writing, speaking, and evaluating. The stimuli (except listening) were presented tachistoscopically and psychological measurements were taken by a Fels dermohmeter and a Gilford cardiachometer. Listening and writing had significantly more arousal than reading; listening and writing were not significantly different from each other. Speaking was significantly greater than listening, and writing and evaluating were significantly greater than speaking. Personal words produced more arousal than pleasant or aversive words. Heart-rate measures did not indicate differences among the 5 modes of communication or the 3 categories of stimulus words.—*P. Federman.*

M.** **Ob urovnyakh i tipakh informatsionnogo kontakta.** [On levels and types of informational contact.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 67-70.—Provides definitions of informational contact and level thereof. Different types of informational contact are examined for a given level.—*I. D. London.*

6252. **Krein, I. M. & Pavlovich, N. V.** **Informatsionnyi kontakt v usloviyakh raznykh kodov pri obshchnosti ponyatii.** [Informational contact when different codes accompany the use of a commonality of concepts.] *Kibernetika i Vychislitel'naya Tekhnika*, 1970, No. 4, 71-73.—Analyzes informational contact with the use of various codes, at whose basis lie common concepts. It is shown that commonality of concepts is insufficient for the establishment of informational contact at a given level. Some language mediator is necessary which, for transmission, could facilitate the evaluation of the correctness of the process and, for reception, could diminish uncertainty.—*I. D. London.*

6253. **Krippendorff, Klaus.** (U. Pennsylvania, Annenberg School of Communications) **On generating data in communication research.** *Journal of Communication*, 1970(Sep), Vol. 20(3), 241-269.—Discusses 3 kinds of communication data: (a) aggregational data accumulated in psychological inquiries, small group experiments, and survey research; (b) network data observable patterns of interest to relational biology and sociology; and (c) communication data proper. Conceptual degenerations in communication research, as a consequence of inadequate data and the importance of analyzing data appropriately, are discussed. (36 ref.)—*P. Federman.*

6254. **McNeil, Keith A.** (Southern Illinois U.) **A validity study of the semantic differential technique.** *College Student Survey*, 1970(Fal), Vol. 4(2), 55-59.—Attempted the validation of the semantic differential technique in the early spring of 1968 with 30 Ss with reference to the characteristics of protest movements by means of 5-point bi-polar scales. A few days after the assassination of Martin Luther King, which was accompanied by widespread burning and looting, 16 of the original 30 Ss rerated the scales. The means of both ratings supported 8 of the 18 research hypotheses at the

.05 level. The 8 movements were characterized as being more strong, usual, large, heavy, fast, new, active, and near than the characteristics describing the opposite pole. The initial data of the 30 Ss were factor analyzed and general evaluation, general activity, and newness emerged. The 2nd collection of data was analyzed and the only significant change was in general evaluation. It is concluded that the semantic differential technique has been partially validated as a measure of connotative meaning.—A. J. Ter Keurst.

Language

6255. Catford, J. C. (U. Michigan) **Learning a language in the field: Problems of linguistic relativity.** *Modern Language Journal*, 1969(May), Vol. 53(5), 310-317.—Assessed the opportunities and disadvantages of learning a foreign language through direct exposure. Basic accepted hypotheses concerning language learning were outlined. It is indicated that although 2nd language learning may show comparable characteristics to a child learning another tongue, the adult is relatively 5 times more efficient in assimilating the 2nd language than is the child. Foreign language learning is considered to be "intellectually internalizing." It is concluded that a foreign language student in the field should be highly motivated and, therefore, likely to engage his intellect, powers of observation, empathy, and his personality.—C. O'Donnell.

6256. Foulke, Emerson. **Methods of controlling the word rate of recorded speech.** *Journal of Communication*, 1970(Sep), Vol. 20(3), 305-314.—Presents 6 methods for increasing speech rate: (a) pacing an oral reader at a rate faster than his normal reading rate, (b) reproducing a tape or record at a speed that is faster than the speed used during the recording, (c) reproducing consecutive samples of recorded tape by an electro-mechanical device, (d) consecutive sampling by a computer, (e) manipulating the word rate of synthesized speech by instructions in the program followed by a speech synthesizer, and (f) increasing word rate by a method of frequency division without temporal alternation and frequency restoration with temporal alternation. (27 ref.)—P. Federman.

6257. Hall, John F. & Mays, Lawrence. (Pennsylvania State U.) **The interrelationships among a number of association measures.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 436-438.—The 5-letter words used by J. D. Taylor and G. A. Kimble were rated by 100 undergraduates for number of associations, familiarity, and pronounceableness; and J. A. Glaze's measure was derived from their responses to the 1st measure. The correlations among these measures of association were quite high (.90-.98), and the relationships between them and the Taylor-Kimble measure of association latency were also substantial (.73-.78).—*Journal abstract*.

6258. Locke, John L. (U. Illinois, Children's Research Center) **Phonetic analysis of pronounceability.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 583-587.—Analyzed phonetic transcriptions of 239 trigram pronunciations to determine the amount and type of speech information they contained, and possibly, to gain insight into the parameters of pronounceability. Ss were 7 phonetically naive undergraduates. When pronounced, trigrams yielded from 2-6 phonemes in 8 different syllable structures and were either monosyllabic or disyllabic. Neither the statistical frequency of phoneme

contexts in spoken English nor the motoric ease of phoneme articulation was observed to explain adequately the ease or difficulty of pronouncing trigrams. A more likely explanation, the presence or absence of grapheme-phoneme correspondence, did not appear to account for all variations in rated pronounceability. (15 ref.)—*Journal abstract*.

6259. McGuigan, F. J. (Hollins Coll.) **Covert oral behavior as a function of quality of handwriting.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 377-388.—Conducted 2 experiments in which female undergraduates, 119 and 90, respectively, wrote words or engaged in comparable nonlinguistic (control) tasks. It was found that both covert oral behavior and breathing rate, but not covert nonoral behavior, were significantly greater during the linguistic task. Amplitude of covert oral behavior varied inversely with the quality of handwriting. It is concluded that covert oral behavior is beneficial in the performance of language tasks.—*Journal abstract*.

6260. Mewhort, D. J. (Queen's U., Kingston, Ontario, Canada) **Guessing and the order-of-approximation effect.** *American Journal of Psychology*, 1970(Sep), Vol. 83(3), 439-442.—Investigated the efficiency with which Ss can fill a missing letter from pseudowords of 0- to 4th-order approximation to English. 32 undergraduates served as Ss. The estimate was used to evaluate how much of the order-of-approximation effect can be attributed to guessing. It is concluded that guessing has negligible effects.—*Journal abstract*.

Psycholinguistics

6261. Howe, Herbert E. (Pennsylvania State U.) **A psychological study of the roles of linguistic cues in the decoding of English sentences.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 898.

AESTHETICS

6262. Deregowski, Jan B. (U. Aberdeen, Scotland) **Note on the possible determinant of "split representation" as an artistic style.** *International Journal of Psychology*, 1970, Vol. 5(1), 21-26.—Art products of children from diverse cultural backgrounds and of adults from cultures that lack highly developed traditions of pictorial art suggest preference for chain-type drawings. It seems safe to conclude that "the observed preference, unless deliberately destroyed by imposition of the established cultural values, persists into adulthood and may result in creation of a corresponding mode of representation." Some societies, such as Northwestern Indian tribes, have developed chain-type drawing to a considerable artistic level. The drawings are not regarded as means of communication about the depicted objects, yet they incorporate a system of cues that improves their communication value. This interpretation has the advantage of being equally applicable to black South Africans, American schoolchildren, and Zambians. (19 ref.) (French abstract)—S. E. Gavin.

6263. Dillon, George L. (U. California, Berkeley) **The art how to know men: A study of rationalist psychology and neo-classical dramatic theory.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 727.

6264. Ferguson, Leonard W. (Ohio U.) **Exhibits at the Provincetown Art Association.** *Perceptual & Motor*

Skills, 1970(Aug), Vol. 31(1), 285-286.—Presents a note indicating the availability of (a) a Provincetown art register, (b) a record of exhibits, and (c) a title register which, in different orders, list all works catalogued for exhibit at The Provincetown Art Association from 1915-1968. More than 14,000 exhibits and the work of more than 2060 artists are listed. It is suggested that the information would be useful for research in the field of art.—*Journal abstract*.

6265. Steig, Michael. (Simon Fraser U., Burnaby, British Columbia, Canada) **Defining the grotesque: An attempt at synthesis.** *Journal of Aesthetics & Art Criticism*, 1970(Win), Vol. 29(2), 253-260.—"The grotesque involves the managing of the uncanny by the comic. More specifically: (a) When the infantile material is primarily threatening, comic techniques, including caricature, diminish the threat through degradation or ridicule; but at the same time, they may also enhance anxiety through their aggressive implications and through the strangeness they lend to the threatening figure. (b) In what is usually called the comic-grotesque, the comic in its various forms lessens the threat of identification with infantile drives by means of ridicule; at the same time, it lulls inhibitions and makes possible on a preconscious level the same identification that it appears to the conscience or superego to prevent. In short, both extreme types of the grotesque (and there are many instances in between) return us to childhood—the one attempts a liberation from fear, while the other attempts a liberation from inhibition; but in both a state of unresolved tension is the most common result, because of the intrapsychic conflicts involved." (23 ref.)—P. R. Farnsworth.

SMOKING & DRUG & ALCOHOL USE

6266. Amo, Michael F. & Bittner, John R. (Purdue U.) **College student attitudes toward marijuana.** *College Student Survey*, 1970(Fal), Vol. 4(2), 52-54.—Reports the attitudes of representative students at a midwestern university toward the smoking of marijuana. 180 Ss checked their opinions on a 5-point rating scale, ranging from strongly agree to strongly disagree in response to 10 sentences that indicated a negative and to 5 a positive orientation toward the use of the drug. The data as a whole indicated a neutral opinion. If the data are interpreted to mean that the Ss did not perceive the questions as being relevant to their own attitudes and checked a "forced" neutral position, combining the positive responses as favoring the use of the drug and the negative ones as opposing its use could be more informative. By this procedure 42% were anti- and 22% pro-marijuana smoking.—A. J. Ter Keurst.

6267. Bowen, Max E. (U. Illinois) **Responses to smoking in the presence of anxiety-eliciting cues.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 895.

6268. Brenner, Joseph H., Coles, Robert, & Meagher, Dermot. (Massachusetts Inst. of Technology) **Drugs and youth: Medical, psychiatric and legal facts.** New York, N.Y.: Liveright, 1970. xiv, 258 p. \$5.95.

6269. Gregory, Francis C. (U. Southern California) **Corrective measures used by faculties as a deterrent to drug abuse among students of selected high schools in California.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 582.

6270. Mitchell, Kenneth R., Kirkby, Robert J., &

Mitchell, Daphne M. (U. New South Wales, Sydney, Australia) **Note on sex differences in student drug usage.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 116.—Administered a questionnaire concerning 51 drugs grouped as decrement-producing (barbituates, bromides, tranquilizers) or increment-producing (amphetamines, hallucinogens, narcotics) to 34 male and 37 female Australian undergraduates. Response comparison showed significantly higher female use of decrement-producing, but not for increment-producing drugs. Females began using decrement-producing drugs at an earlier age and had used them for a longer period. All females as compared to 40% males reported "stress" as the primary reason for using such drugs. "Doctor" was reported as the source for such drugs by both groups; females also reported "mother" as an important source.—M. West.

6271. Mizner, George L., Barter, James T., & Werme, Paul H. (U. Colorado, Medical School) **Patterns of drug use among college students: A preliminary report.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 15-24.—Reports results from 26,000 university students' replies to a questionnaire concerning: (a) the frequency of drug use, (b) mood states at time of use, (c) age at 1st use and reasons drug use was continued or discontinued, (d) attitudes toward drug use, (e) plans for future use, and (f) attitudes toward drug legislation. The questionnaire focused primarily on use of amphetamines, marijuana, and LSD. The most commonly used drug was marijuana which had been used by 26% of the students. Amphetamines had been used by 14% and LSD by 5%. Patterns of drug use were contrasted with a variety of demographic variables and with different college and university characteristics.—P. R. Shibelski.

6272. Schultes, Richard E. (Harvard U., Botanical Museum) **Hallucinogens of plant origin.** *Science*, 1969(Jan), Vol. 163(3864), 245-254.—Presents an ethnobotanical summary of plants containing psychoactive substances and discusses their significance for primitive cultures. It is noted that of the estimated 400,000-800,000 plant species, only approximately 60 have been used as hallucinogens, and of these only 20 are considered important. Hallucinogens occur throughout the plant kingdom but show an unexplained concentration in the New World. Included in the discussion are *Amanita muscaria* (a variety of mushroom), *Cannabis sativa*, *khanna*, several South American snuffs, *peyote*, *ololiuqui* (a morning glory), *Salvia divinorum* (a variety of mint), *Datura*, and *Henbane*. (40 ref.)—P. McMillan.

6273. Walsh, John. **Narcotics and drug abuse: A presidential prescription.** *Science*, 1969(Jul), Vol. 165(3891), 377-378.—Discusses President Nixon's message to Congress proposing a 10-point drug program which includes "a rewriting of existing narcotics and dangerous-drug legislation." The proposal calls for (a) measures to suppress international and domestic trafficking in drugs; (b) a model state drug law; (c) improved education programs by the departments of Justice and Health, Education, and Welfare; and (d) training and assistance for local law enforcement personnel. The program is discussed in light of its legislative possibilities and its acceptance by the scientific and professional community.—P. McMillan.

PERSONALITY

6274. Ebersole, Peter. (California State Coll.,

Fullerton) **Effects of nadir experiences.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 207-209.—Experimental studies of positive growth have generally neglected the possibility that painful (nadir) experiences can have beneficial effects. Between 36% and 44% of 36 undergraduates reported basically positive effects resulting from their nadir experiences. Also, 39% of the Ss stated that nadir effects were more important than peak (most wonderful, happy experiences) effects. Data provide support for A. H. Maslow's contention that suffering can have beneficial effects and suggest that more attention should be given to nadir effects, both in investigations of positive growth and in diagnostic studies related to peaks and nadirs.—*Journal abstract.*

6275. Levy, Leon H. (Indiana U.) **Conceptions of personality: Theories and research.** New York, N.Y.: Random House, 1970. ix, 492 p. \$10.95.

6276. Mahrer, Alvin R. (Ed.) (Miami U.) **New approaches to personality classification.** New York, N.Y.: Columbia U. Press, 1970. 425 p. \$12.50.—Presents structural, functional, and comprehensive approaches to personality classification and psychodiagnosis by a number of scholars attempting to develop new systems. The approaches vary from significant modifications of the current classification of mental orders to new departures growing out of the behavior modification theories and schools of existential psychology and psychiatry.

6277. Munns, Meredith. (U.S. Naval Air Development Center, Aerospace Medical Research Dept., Johnsville, Warminster, Pa.) **The nature of personality theory.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 11-16.—Outlined the historical antecedents and present status of personality theories, together with future trends. The impact of various factors, including scientific methodology and the growing existential movement, are discussed. That the very nature of personality seems to preclude or make intractable its study is the central theme.—*Journal abstract.*

6278. Murphy, Gardner. (George Washington U.) **Experiments in overcoming self-deception.** *Psychophysiology*, 1970(May), Vol. 6(6), 790-799.—Examines 3 mechanisms for self-deception and scanning internal information: (a) satisfactions in relation to particular figures, (b) directional factors, and (c) perceptual avoidance. It is felt that self-deception is based on the limiting of input and the concept of scanning. Since the "habits of scanning are learned," it is postulated that with adequate feedback training a person "might learn to detect his own defensive rigidities; indeed, in time he might become aware of every act of self-deception." Feedback and relaxation methods are discussed. (21 ref.)—*G. Steele.*

6279. Rehm, Lynn P. (U. Wisconsin) **The effects of validation on the relationships between personal constructs.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 400-401.

6280. Valente, L. & Merciai, S. **Profilo psicologico di alcuni studenti contestatari.** [Psychological profile of some student activists.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1969(Mar), Vol. 30(2), 115-166.—8 student activists in leading positions showed: (a) an average to above average intelligence on the WAIS, (b) variable levels of contact with reality and conformism, (c) insufficient potential to establish interpersonal relations (Rorschach), (d) manifest aggressivity, (e) a regressive perception of the mother figure, (f) author-

itative and anxiety-provoking perception of the father figure, and (g) possibly clinical and subclinical signs of pathology.—*L. L'Abate.*

PERSONALITY TRAITS & PROCESSES

6281. Brenneis, Brooks. (Yale U., Medical School) **Male and female ego modalities in manifest dream content.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 434-442.—Compared aspects of the setting, activity, and characters in the manifest dreams of 111 young adult females and 72 young adult males in order to demonstrate differential patterns in structuring the manifest dream and to correlate these patterns with theoretical ideas about characteristic differences between male and female ego organization. A chi-square test of the results indicates a number of significant differences which indicate a greater tendency for men to structure their manifest dreams in terms of extension and separateness and for women to structure their manifest dreams in terms of intimacy. Results are discussed in terms of their fit with E. Erikson's concepts of male and female ego formation and D. Gutmann's notion of an allocentric male milieu and autocentric female milieu. (26 ref.)—*Journal abstract.*

6282. Burhenne, Dianne & Mirels, Herbert L. (Ohio State U.) **Self-disclosure in self-descriptive essays.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 409-413.—Employed a self-description essay procedure to ascertain the degree to which self-disclosing behavior would be predicted by scores on the Jourard Self-Disclosure Questionnaire and by scores on the Marlowe-Crowne Social Desirability Scale (SDS). Data from 56 college women revealed no relationship whatever between Questionnaire scores and judges' ratings of self-disclosure; a significant negative relationship was obtained between SDS scores and the self-disclosure ratings. Judges' liking for the respondent and respondent verbal-fluency were found to be substantially associated with the ratings of self-disclosure. Implications of the present results for the concept and assessment of self-disclosure are discussed. (17 ref.)—*Journal abstract.*

6283. du Preez, Peter & Ward, D. G. (U. Cape Town, South Africa) **Personal constructs of modern and traditional Xhosa.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 149-160.—Based on data gathered from 40 working adults and 40 youths, several differences were found between modern and traditional Xhosa. Members of the modern group showed greater homogeneity in construing themselves, used more permeable constructs which covered wider ranges of events, and had the self and ideal self more closely related than in the traditional group. The greater diversity of self-constructs in the traditional group is taken to imply that it is falling apart, and that there is low agreement about how members ought to see themselves, a conclusion which is confirmed by the low self-ideal self correlations in this group. (15 ref.)—*Journal summary.*

6284. Feather, N. T. (Flinders U., Bedford Park, Australia) **Preference for information in relation to consistency, novelty, intolerance of ambiguity, and dogmatism.** *Australian Journal of Psychology*, 1969(Dec), Vol. 21(3), 235-249.—77 male and 81 female undergraduates 1st wrote pro and con arguments for American intervention in South Vietnam and then rated

the direction and degree of their interest in reading 4 sets of information concerned with this issue: familiar arguments—pro and con intervention, and novel arguments—pro and con intervention. Subsequently they completed an attitude scale concerned with American intervention, S. Budner's test of intolerance of ambiguity, and Form E of Rokeach's Dogmatism Scale. Results show that: (a) Ss displayed positive interest in information, preferred consistent to inconsistent information, and preferred novel to familiar information; and (b) high intolerant and high dogmatic Ss showed a more pronounced preference for consistent information and a less pronounced preference for novel information than did low intolerant and low dogmatic Ss. (26 ref.)—*Journal abstract.*

6285. **Freundlich, David.** Narcissism and exhibitionism in the performance of classical music. *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 1-12.—When narcissism and fantasies of omnipotence are appropriately transformed and incorporated into the exhibitionism of the performance, the result is an egosyntonic sublimation or character trait rather than a neurotic defense. These infantile impulses reach productive adult expression and contribute to healthy motivation, ambition, and satisfaction. When the childish needs for exhibitionism are strongly curtailed or conflicted during psychosocial growth, the adult performer may not be able to utilize them and instead may experience anxiety or its consequences when narcissistic demands are made or infantile fantasies in this area are stimulated. This contributes to inhibitions which performers experience as unreliable memory, technical lapses, inappropriate expression, overcontrol, or as a global fear of the stage.—*Journal summary.*

6286. **Greenwald, Herbert J. & Clausen, John D.** (Massachusetts State Coll., Bridgewater) Test of relationship between yeasaying and social desirability. *Psychological Reports*, 1970(Aug), Vol. 27(1), 139-141.—Possible overlap in previous measures testing the independence of yeasaying and social desirability responding prompted a test with separate measures. Both measures were answered on an agree-disagree format by 60 undergraduates. No relationship was found; the present measure of yeasaying—number of agreements to 20 "nondiscriminating" items—did not correlate with either the positively or negatively keyed items of the Crowne-Marlowe Social Desirability scale.—*Journal abstract.*

6287. **Hjelle, Larry A. & Aboud, John.** (Villanova U.) Some personality differences between seminarians and nonseminarians. *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 279-280.—Investigated personality characteristics related to religious ego-involvement by utilization of the known criterion groups method. Specifically, a group of 33 Catholic seminarians were compared with a group of 57 Catholic nonseminarians on several EPPS variables. The results strongly confirmed the expectation that individuals who express an intense behavioral commitment to conventional religion can be characterized in terms of a set of highly uniform personality variables.—*Author abstract.*

6288. **Hogan, H. Wayne.** (Tulane U.) A symbolic measure of authoritarianism: An exploratory study. *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 215-219.—73 undergraduates were used to test the hypothesis that the personality dimension of authoritarianism can be measured by means of symbols designed

to differentiate between persons tolerant and intolerant of ambiguity just as well as it is currently measured by the verbal California F Scale. The hypothesis is affirmed, using gamma as the test of significance, at the .0069 level. Briefly discussed are the study's methodological implications. (25 ref.)—*Author abstract.*

6289. **Lazare, Aaron; Klerman, Gerald L., & Armor, David J.** (Harvard U.) Oral, obsessive and hysterical personality patterns. *Journal of Psychiatric Research*, 1970(Jul), Vol. 7(4), 275-290.—The 3 personality patterns were defined by a total of 20 traits obtained from a review of the clinical literature. Each of the 20 traits was measured by 7 self-rated items which reflected behavior related to the trait to be measured. Of the final 140 items in the self-rating form, only 28 items had item-to-trait correlation of less than .50. The trait scores for the 100 female patients were factor analyzed yielding 3 factors with latent roots greater than 1. The 3 unrotated factors accounted for 43% of the total variance.—*R. V. Hamilton.*

6290. **Lewinsohn, Peter M., Flippo, Joseph R., & Bergquist, William H.** (U. Oregon) Leveling-sharpening: Its relation to repression-sensitization and memory. *Psychological Reports*, 1970(Aug), Vol. 27(1), 211-214.—Studied the relationships between leveling-sharpening and (a) repression-sensitization, and (b) short- and long-term memory. 2 separate measures of repression-sensitization, the Byrne Repression-sensitization-scale and the Rorschach Index of Repressive Style, were used on 500 undergraduates, and 48 Ss were selected from the total as having very high or very low scores. Repression-sensitization and leveling-sharpening were not related, nor was the hypothesized relationship between leveling-sharpening and memory obtained.—*Journal abstract.*

6291. **Margolis, Clorinda G.** (Thomas Jefferson U., Philadelphia, Pa.) Coping and defensive responses in four role-playing situations. *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 427.—Attempted to operationalize the Kroeber-Haam model (see N. Haan, PA, Vol. 38:4234) of ego functioning and to explore the relationship of ego strength to coping responses. 40 undergraduates identified as high or low ego strength role played each of 4 stress situations. High ego strength Ss showed significantly more coping responses. Justified punishment and unjustified praise raised more defensive responses than unjustified punishment and justified praise. Chi-squares found no significant relationship between level of ego strength and the mechanisms used.—*M. West.*

6292. **Marino, Dominic R., Fitzgibbons, David J., & Mirabile, Charles S.** (Inst. of Living, Hartford, Conn.) Attention deployment in field dependence and autokinetic movement. *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 155-158.—Investigates autokinetic response tendency based upon a conceptualization of the autokinetic phenomenon as being rooted in attention deployment. The hypothesis that field-dependence-independence and the autokinetic phenomenon require a similar type of attention deployment was tested in a multiple regression design with 47 18-25 yr. old female Ss. Results suggest that the autokinetic response requires the ability to attend selectively to relevant aspects of the external environment while ignoring the spatial context in which they are embedded. Attention to internal stimuli was found to be unrelated to the autokinetic response tendency.—*Journal abstract.*

6293. Mehryar, A. H. (Pahlavi U., Shiraz, Iran) **Authoritarianism, rigidity, and Eysenck's E and N dimensions in an authoritarian culture.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 326.—Administered the Eysenck Personality Inventory and the 29-item California F Scale and a 22-item Rigidity scale by Rokeach to 108 undergraduate Iranian Ss. Product-moment correlations support neither Eysenck's hypothesis linking extroversion and authoritarianism, nor the implicit association between authoritarianism and neuroticism.—*M. West.*

6294. Meisels, Murray & Canter, Francis M. (Eastern Michigan U.) **Personal space and personality characteristics: A non-confirmation.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 287-290.—Hypothesized that greater spatial distances would be used under the stress of talking about a difficult topic and by introverted and deviant Ss. In Study I, 52 female undergraduates completed an introversion-extroversion scale and $1\frac{1}{2}$ were assigned an easy or difficult topic to discuss with another student (an accomplice). In Study II, 96 female undergraduates completed 4 measures of deviancy and interacted with a student (accomplice) under nonstress and then under stress conditions. Difficult conversation topics did not lead to greater distances and, in contrast with previous research, introversion and deviancy did not correlate significantly with individual distance.—*Journal abstract.*

6295. Meyer, Wulf U. (Ruhr U., Psychologische Inst., Bochum/Querenburg, W. Germany) **Anspruchsniveau und erlebte Selbstverantwortlichkeit für Erfolg und Misserfolg.** [Aspiration level and self-responsibility for success and failure.] *Psychologische Beiträge*, 1969, Vol. 11(3), 328-348.—Investigates relationships between aspiration level and perceived responsibility for success and failure assessed by means of a questionnaire developed by Crandall, et al. The following results are presented: (a) the absolute difference between aspiration level and attainment level decreases with increasing self-responsibility scores for success and failure, (b) more atypical shifts of aspiration level are found among Ss with lower scores on the self-responsibility scale, and (c) Ss with low scores tend to set more rigid goals than Ss with high scores in self-responsibility. (Frency summary) (40 ref.)—*English summary.*

6296. Miller, Daniel R. (Brunel U., Middlesex, England) **Optimal psychological adjustment: A relativistic interpretation.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 290-295.—As a basis for interpreting the impressive findings by E. Siegelman, J. Block, J. Block, and A. von der Lippe (see PA, Vol. 45:Issue 3) relating optimal psychological adjustment in adults to observations made of their families when the Ss were children, it is postulated that mental health be defined relative to sex, generation, epoch, and culture. An analysis of items included in the criterion of optimal adjustment suggests that it is most pertinent to families whose breadwinners have managerial or professional jobs in bureaucratic organizations, and that it might be misleading if applied to top executives, employees of entrepreneurial organizations, or members of the working class.—*Journal abstract.*

6297. Ogston, Don; Altman, Harold A., & Lane, Ada M. (U. Calgary, Alberta, Canada) **Meaning: A study of personality.** *Western Psychologist*, 1970(May), Vol. 1(3), 106-110.—Tested D. R. Peterson's (see PA, Vol. 39:10211) hypothesis that adjustment is good, neuroti-

cism is bad, and extroversion means strong and active. A 15 scale, 7-point semantic differential rated the concepts extroversion, adjustment, and myself for 400 undergraduates. Personality scores were used to group the Ss and self-ratings compared. Extroversion was generally found to be related to activity and evaluation, and adjustment to potency. Neurotic-extroverts rated themselves the highest on all 3 semantic dimensions. Adjusted-introverts rated themselves the lowest. It is suggested that results may reflect a particular cultural bias and self-perception effect.—*Journal summary.*

6298. Paffard, M. K. (U. Keele, England) **Creative activities and "peak" experiences.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 283-290.—400 6th-form and undergraduate respondents to a questionnaire wrote about any experiences they had had which they felt were similar to ones quoted from an autobiography in the questionnaire which described experiences in childhood of ecstatic joy in nature, turning sometimes to awe and fear. 55% responded to this question. No attempt is made to classify or describe the variety of experiences reported by the respondents: only some differences between the 2 groups of respondents, those describing experiences of some kind and those not doing so, are presented. A significant correlation between Ss describing such experiences and Ss expressing active interest in creative writing, painting, music, and reading poetry is emphasized. The respondents admitting to such creative artistic interests are further compared with those not doing so. (15 ref.)—*Journal abstract.*

6299. Peabody, Dean. (Swarthmore Coll.) **Evaluative and descriptive aspects in personality perception: A reappraisal.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 639-646.—The widespread emphasis on evaluation in personality perception was questioned by D. Peabody, who showed the importance of separating evaluative and descriptive aspects of trait judgments. The available evidence—including the from S. Rosenberg and K. Olshan (see PA, Vol. 45:Issue 4) and A. Felipe (see PA, Vol. 45:Issue 4)—is reexamined and suggests the following conclusions: (a) in the covariation of many traits, evaluative and descriptive relations are of comparable importance; (b) in separate trait judgments, descriptive effects are the more important when descriptive relations are strong; and (c) in the combining of several traits, it is the descriptive effects that are enhanced.—*Journal abstract.*

L'Abate.*

Behavior Correlates

6308. Daniel, Jozef & Školdácková, Jela. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Correlations among various forms of secondary load and personality.** *Studia Psychologica*, 1970, Vol. 12(3), 244-245.

6309. Dengerink, Harold A. (Kent State U.) **Affective responsiveness, aggression and physiological arousal.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 391.

6310. Dixon, Theodore R. (Texas Christian U.) **Experimenter approval, social desirability, and statements of self-reference.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 400-405.—Using 40 undergraduate Ss high or low on a social desirability scale, a verbal conditioning attempt was made to alter the relative frequency of self-referent statements that were either positive or negative. Before reinforcement, high and low social desirability Ss responded very similarly, and used more positive than negative self-references. High social desirability Ss

responded to reinforcement by increasing equally the frequency of both positive and negative self-referent statements. Low social desirability Ss did not condition, but continued to make more positive than negative self-references. Although high and low social desirability Ss both have the need to impress others favorably, the high social desirability person is apparently more dependent on the overt, evaluative behavior of others, and for this reason he can be manipulated more easily than low social desirability Ss.—*Journal abstract.*

6311. Eisenman, Russell & Boss, Evelyn. (Temple U.) **Complexity-simplicity and persuasibility.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 651-656.—To test the generality of a previous finding concerning the way Ss who preferred simplicity reacted to threatening information, 88 high school students were studied. $1/2$ the Ss were given a positive discussion about paintings and $1/2$ were given a negative discussion. Categorization by complexity vs. simplicity preferences for polygons show that Ss who preferred simplicity significantly differed in their ratings of the paintings, depending upon whether they were in the positive or negative orientation group. Demographic correlates of age, sex, birth order, and family size are considered.—*Journal abstract.*

6312. Fremont, Theodore; Means, Gladys H., & Means, Robert S. (Oklahoma State U.) **Anxiety as a function of task performance feedback and extraversion-introversion.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 455-458.—Administered the MPI to 200 undergraduates in a midwestern university. Those who scored in the top 15% and the bottom 15% of the population tested were identified as extroverts and introverts, respectively. These 2 groups, 1 composed of 30 extroverts and the other of 30 introverts, were administered the Digit Symbol test. Upon completion of the task, each S received 1 of 3 predetermined and randomly assigned types of feedback concerning his performance. Treatment I Ss were told that results of the Digit Symbol task indicated that they had performed better than most college students. Treatment II Ss were told that their task performance was lower than that of most college students. Treatment III Ss were given no information concerning their performances. A 2×3 multiple analysis of variance design was employed to analyze Ss' performances on the Multiple Affect Adjective Check List, a standardized measure of anxiety, which was administered immediately after the feedback session. Significant differences were found on the treatment (feedback information) and the extrovert-introvert dimensions. A significant interactive effect was also observed.—*Journal abstract.*

6313. Frost, Barry P. (U. Calgary, Alberta, Canada) **A note on extraversion and aggression.** *Western Psychologist*, 1970(May), Vol. 1(3), 111-112.—Reanalyzed findings from a recent study by B. P. Frost to examine the relationship, if any, between the aggression variables and extraversion. Data for the Extroversion scale of the Junior Eysenck Personality Inventory and the Aggression scales of the Frost Self Description Questionnaire were submitted to a Principal Components analysis. Results show that introverts internalize aggression. Data, however, did not provide evidence that the contrary is true (i.e., that extroverts externalize aggression).—*P. McMillan.*

6314. Gilson, Charlotte R. (Yale U.) **Individual differences in risk taking.** *Office of Naval Research Technical Report*, 1968(Jun), No. 13, 71 p.

6315. Graf, Richard G. & Hearne, Louise. (San Diego State Coll.) **Behavior in a mixed motive game as a function of induced self-esteem.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 511-517.—Induced high, neutral, and low self-esteem in 64 undergraduates who then took part in a mixed motive game. It was hypothesized that induced low self-esteem would result in highly competitive behavior. This prediction was confirmed for the 1st trial block of 10 trials but no difference in competitive behavior among the 3 groups was observed during the 2nd-5th trial blocks. Results are discussed in terms of the success of the induction of level of self-esteem, the perceived strategy of the other player, and the way in which the perceived strategy might interact with chronic and induced levels of self-esteem.—*Journal abstract.*
6316. Grove, Michael S. & Eisenman, Russell. (Temple U.) **Personality correlates of complexity-simplicity.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 387-391.—Tested inferences derived from previous research in personality and creativity. 61 undergraduates were given a variety of personality measures and a group of 28 Ss were exposed to an authoritarian speech to see whether the speech would increase their liking of hostile humor. Although the authoritarian speech did not influence humor preferences, the personality correlates of complexity-simplicity preferences were consistent with previous research. Number of points on the polygons correlated .90 with subjective ratings of complexity by males and .92 with subjective ratings of complexity by females. Whether or not symmetry may be equated with simplicity and asymmetry with complexity are discussed.—*Journal abstract.*
6317. Kazelskis, Richard. (U. Southern Mississippi) **Field independence and the free-recall of nonsense syllables.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 351-354.—Classified 40 graduate Ss as either field independent or field dependent and then randomly assigned to 1 of 4 free-recall learning situations which were varied in terms of mode of item presentation and item meaningfulness. A $2 \times 2 \times 2$ factorial experiment was performed. The hypothesized Field Independence \times Meaningfulness and Field Independence \times Mode of Presentation interactions were not significant, but significant main effects were found for field independence ($p < .05$), meaningfulness ($p < .01$), and mode of presentation ($p < .05$). It is concluded that lists of nonsense syllables high in intralist similarity form embedding contexts analogous to the contexts presented in the Embedded Figures Test.—*Journal abstract.*
6318. Knott, Paul D. & Drost, Bruce A. (U. Denver) **Sex-role identification, interpersonal aggression, and anger.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 154.—Selected 20 each of males and females adequately adjusted to their sex roles and inadequately identified with their sex roles. Ss were each shocked by a confederate and then allowed to counter-shock. Only adequately adjusted males showed significantly more aggression than the other 3 groups in contrast to findings by D. B. Leventhal, K. M. Shemberg, and S. K. Schoelandt. It is suggested that "the relationships between sex-role identification and the expression of aggression in sanctioned or non-sanctioned conditions will remain ambiguous" until more is known about "the relationships among anger, anxiety about anger, and the actual expression of aggression."—*M. West.*
6319. Knox, Wilma J. & Grippaldi, Ricardo. (Veterans Administration, Biloxi, Miss.) **High levels of state or trait anxiety and performance on selected verbal WAIS subtests.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 375-379.—Administered the State-Trait Anxiety Inventory and WAIS subtests, Arithmetic (A), Similarities (S), and Digit Span (DS) to male Ss entering a Veterans Administration domiciliary. 2 analyses of variance were carried out among WAIS weighted scores on the 3 subtests for 3 groups (with 18 Ss each) of different state or trait anxiety levels (high, medium, and low). Analyses show significant interactions between WAIS scaled scores and anxiety: $p < .05$ for state anxiety and $p < .001$ for trait anxiety. The high-anxiety group in each instance showed the classical expectation of a lower A and DS in comparison to S; performance on DS was highest for each medium anxiety group. Curvilinear relationships and interaction effects in anxiety are discussed.—*Journal abstract.*
6320. Krauss, Herbert H. & Blanchard, Edward B. (U. Georgia) **Locus of control in ethical risk taking.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 142.—Administered Rotter's Internal-External Control Scale to 56 male and 36 female undergraduates and selected only Ss with extreme external or internal locus of control scores. The 45 selected Ss received Rettig's Behavior Prediction Scale, a test to predict the probability with which an unethical decision will be made under varied circumstances and which yields 4 component scores: sensitivity to expectation of gain, reinforcement value of gain, expectation of censure, and reinforcement value of censure. Analysis of variance revealed nonsignificant interactions between sex, locus of control, and ethical risk component. Other variables are suggested which may produce the risky shift in ethical risk-taking behavior.—*M. West.*
6321. Landis, Daniel & Slivka, Robert M. (Educational Testing Service, Princeton, N.J.) **Some determinants of multidimensional points of view: Two studies.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 659-670.—Reports 2 studies bearing on the relationship of multidimensional points-of-view to cognitive perceptual style and complex decision-making performance. In Study I, 31 Ss scaled 2 sets of stimuli. Factor loadings from a points-of-view analysis were correlated with scores from 8 cognitive perceptual style measures. Sufficient significant correlations were found to warrant a more extensive study. In Study II, 120 Ss scaled 12 problem maps after solving the problems. Each S was also administered the measures used in Study I. The scaling data were subjected to a points-of-view analysis and related to the solution and style data by a stepwise multiple regression procedure. Results indicate that: (a) multidimensional points of view are related to style data; (b) points of view are also related to complex decision-making performance; and (c) some of the previously reported style groups break down into subgroups. (24 ref.)—*Journal abstract.*
6322. Lefcourt, Herbert M. & Siegel, Jerome M. (U. Waterloo, Ontario, Canada) **Reaction time performance as a function of field dependence and autonomy in test administration.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 475-481.—Observed the effects of self- vs. E administration of RT tasks upon field-independent and field-dependent Ss with both regular and irregular procedures. It was

predicted that the more autonomous, self-directed condition would be favored by field-independent Ss, whereas E-controlled conditions would be preferred by field-dependent Ss. Results provide some support for these hypotheses in the male sample ($N=30$). Female Ss ($N=30$) produced a different pattern of results, suggesting that field dependence may have different implications in relation to sex. (17 ref.)—*Journal abstract.*

6323. **Lester, David.** (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **The need to achieve and the fear of death.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 516.—Tested the hypothesis that a need to achieve is positively correlated with a fear of death. Need to achieve was measured by stories written about 4 pictures and fear of death by the completion of 2 scales by J. I. Boyar and D. Lester. Ss were 199 female undergraduates. Results failed to show a significant correlation between the 2 variables.—*P. McMillan.*

6324. **Maccoby, Michael.** **Las actitudes emocionales en relación con las elecciones políticas.** [Emotional attitudes in relation to political elections.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1969, No. 11, 59-68.—Discusses the development of a questionnaire to judge emotional attitudes which underlie political preferences in the United States. 3 basic character dimensions were considered capable of being objectively qualified through interpretative questions: (a) love for life, as opposed to that which is dead or mechanical; (b) realism and sense of relation, as opposed to narcissism; and (c) independence, as opposed to extreme dependence. A love continuum (Fromm) which rated love of life to negation of life was the basis of a test of 15 questions given to 160 California voters from different socioeconomic levels in the 1968 presidential elections. Significant correlations were found between peace candidates and Ss who were young, educated, and who scored a strong love for life. It was shown that an S's amount of love for life was related to his political philosophy.—*P. Hertzberg.*

6325. **MacDonald, A. P.** (West Virginia U., Rehabilitation Research & Training Center) **Internal-external locus of control and the practice of birth control.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 206.—Included the Rotter Internal-External Control scales in questionnaires administered to 508 undergraduates to test the hypothesis that Ss with external orientations might be less likely to control their pregnancies. Data from 212 females were analyzed separately for those married and unmarried. In unmarried Ss, as predicted, 62% of the internal controls (Is) and 37% of the external controls (Es) reported using some form of birth control. Though in the predicted direction, data from married Ss failed to reach significance; birth control practices were reported by 87% of the Is and 63% of the Es.—*M. West.*

6326. **Montgomery, Doil D. & Bone, Ronald N.** (West Virginia U.) **Dream recall and cognitive style.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 386.—Investigated the suggestion of previous research that field independent Ss have higher dream recall than field dependents. S's scores were correlated on the Identical Figures Task, as a measure of field independence, with estimates (7-point scale) of their current dream recall. Results yield nonsignificant correlations for both 65 males ($r = .09$) and 64 females ($r = .02$), thus failing to support previous research.—*Author abstract.*

6327. **Nidorf, Louis J. & Argabrite, Allan H.** (San Fernando Valley State Coll.) **Cognitive complexity and the tendency to make extreme judgments.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 478.—Measured cognitive complexity by requesting 166 undergraduates to describe 1 person they liked and 1 they did not like. The measure of cognitive complexity was defined by the number of interpersonal constructs used by Ss; Ss also judged a number of concepts using a 12-scale semantic differential. Measures of extreme responsiveness and cognitive complexity were chi-square analyzed. It was found that cognitively complex Ss tend to make extreme judgments.—*M. West.*

6328. **Pivnicki, D.** (Allan Memorial Inst. of Psychiatry, Montreal, Quebec, Canada) **Aggression reconsidered.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 235-241.—Reconsiders aggression as a zoological, psychological, ethical, philosophical, religious, and political problem. Acts may be referred to as aggressive when they seem incompatible with outlooks and beliefs. It is suggested that by suppressing aggressive acts the energies man needs to survive may be harmed or even destroyed. (29 ref.)—*D. Prager.*

6329. **Smith, Ronald E. & Jeffery, Robert W.** (U. Washington) **Social evaluative anxiety and the reinforcement: Properties of agreeing and disagreeing attitude statements.** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 276-280.—Administered an 80-trial visual discrimination learning task to 38 female undergraduates designated as high and low in social-evaluative anxiety. Agreeing and disagreeing attitudinal statements were made contingent upon correct and incorrect responses, respectively. It was proposed that the secondary reinforcement properties of attitude statements, acquired through discriminative reward training in situations involving approval and disapproval, would be greater for high socially anxious Ss than for nonanxious Ss. Consistent with predictions, the high-anxiety group showed significantly greater learning effects on the discrimination task than did the nonanxious group. Results also suggest that awareness of the attitudinal reinforcement contingency is not necessarily required in order for learning to occur.—*Journal abstract.*

6330. **Stark, Stanley & Kugel, Yerachmiel.** (Michigan State U.) **Toward an anthropology of dogmatism: Maladjustment, modernization, and Martin Luther King.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 291-309.—Presents research and prima facie reasons for suspecting inverse correlation between the Rokeach Dogmatism scale and the Inkeles Overall Modernity scale, and suggests (a) that the more "democratic," "openminded," "pluralistic," and "tolerant" a society, the more maladjusted to it will be "traditional man"; and (b) that an example of such a man is Martin Luther King. (41 ref.)—*Journal abstract.*

6331. **Thurner, Franz.** (24 Calsowstr., Göttingen, W. Germany) **Angstlichkeit: Eine Persönlichkeitsvariable und ihre Auswirkungen.** [Anxiety: A personality variable and its effects.] *Psychologische Rundschau*, 1970(Jul), Vol. 21(3), 187-213.—The theoretical discussion penetrates into the effects of anxiety upon perception and memory, and, in turn, upon judgments and behavior. Selected experimental results support the theoretical structure. Menacing, affect-loaded events are retained much longer by anxious persons, perhaps

even selectively perceived with the stream of events. The cumulative effect of these processes results in a self-image which is too negative. (54 ref.)—*W. J. Koppitz.*

INTELLIGENCE

6332. **Bajema, Carl J.** (U. Chicago, Population Research & Training Center) **A note on the interrelations among intellectual ability, educational attainment, and occupational achievement: A follow-up study of a male Kalamazoo public school population.** *Sociology of Education*, 1968(Sum), Vol. 41(3), 317-319.—Presents a follow-up study of C. J. Bajema (see PA, Vol. 41:4466) Kalamazoo Fertility Study of 437 civilian noninstitutionalized males, who were born in 1916 or 1917 and who were alive at age 45. Terman Group Intelligence Test scores were used to measure the intellectual ability of the Ss. Data indicate that while intelligence is associated with occupational achievement, its effects apparently operate wholly within the educational system.—*Journal abstract.*

6333. **Dubois, Thomas E. & Cohen, Walter.** (U. New Hampshire) **Relationship between measures of psychological differentiation and intellectual ability.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 411-416.—Obtained significant correlations ranging from -.21 to -.56 between field-independence measures and diverse measures of intellectual achievement many of which ostensibly have little or no relationship to embedding contexts, spatial-perceptual skills, or non-verbal organization. 143 female undergraduates served as Ss. The adequacy of H. A. Witkin's notion that significant relationships between measures of field-independence and intelligence can be explained on the basis of a common requirement for overcoming embedded contexts is questioned. An alternative interpretation is proposed and other lines of evidence consistent with this viewpoint are presented. (28 ref.)—*Journal abstract.*

6334. **Irvine, Sidney H.** (Educational Testing Service, Princeton, N.J.) **Figural tests of reasoning in Africa: Studies in the use of Raven's Progressive Matrices across cultures.** *International Journal of Psychology*, 1969, Vol. 4(3), 217-228.—Experiments involving Ss from various educational groups in Africa and Great Britain, using Raven's Progressive Matrices, compared item difficulty and described strategies employed. Factorial analysis shows that environmental variables, whether verbally loaded or not, are not associated for central African Ss. Cross-cultural analysis reveals that item difficulties change from culture to culture, and that test scores approach Western patterns as the groups adopt Western value systems. Appearance of differing individual strategies in problem solving renders it unwise to assume that the same total score provides evidence of identical samples of psychological behavior. Research with African Ss shows "that sources of variance exist that call for some revision of... assumptions about the reduction of cultural bias in figural test items." (French abstract) (38 ref.)—*S. E. Gavin.*

6335. **Mehryar, A. H. & Shapurian, R.** (Pahlavi U., Shiraz, Iran) **The application of a high-grade intelligence scale (AH5) in Iran.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 307-313.—Gave a Persian form of Heim's AH5, a high-grade group intelligence scale, to a representative sample of Iranian secondary school pupils (575 boys, 433 girls, aged 17-18 yr.). Iranian Ss as a group were found to score substantially lower than their British counterparts. Girls

were inferior to boys on both verbal and nonverbal scales of the test and there were significant differences between the 3 fields of specialization.—*Journal abstract.*

6336. **Nicholson, Charles L.** (North Carolina Central U.) **Analysis of functions of the Slosson Intelligence Test.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 627-631.—Performed a functional analysis of the Slosson Intelligence Test (SIT) using the schema designed by J. M. Sattler for analyzing the Stanford-Binet. The 2 instruments were then compared. Analysis indicates that, despite the high correlations reported between the 2 instruments, they evaluate the various mental functions in different proportions, except at the adult level. There were significant correlations among the rank order of the categories evaluated at various age levels of the SIT.—*Journal abstract.*

6337. **Wober, Mallory.** (U. Bristol, England) **Meaning and stability of Raven's Matrices test among Africans.** *International Journal of Psychology*, 1969, Vol. 4(3), 229-235.—86 Nigerian adult male Ss took the Raven's Progressive Matrices and an adapted Embedded Figures Test and 6 mo. later took the Matrices test again. Retest scores showed a significant rise and a significantly higher correlation with the Embedded Figures Test than appeared at the 1st testing. Improved scores appeared particularly among lower initial scorers. Discussion of related research suggests the importance of the social situation under which testing occurs, the communication method, and the possibility that Ss learn to perceive, decode, and process information more efficiently in 1 medium than in another. The complexity of the situation suggests that future research be designed to yield unequivocal results. (French abstract) (20 ref.)—*S. E. Gavin.*

CREATIVITY

6338. **Helson, Ravenna.** (U. California, Inst. of Personality Assessment & Research, Berkeley) **Sex-specific patterns in creative literary fantasy.** *Journal of Personality*, 1970(Sep), Vol. 38(3), 344-363.—A panel of judges rated the creative excellence of 72 works of fantasy written for 8-12 yr. old children since 1930. Formal dimensions, needs, themes, and stylistic characteristics of the books were described by rater-analysts. Overall, books by men and women differed very little, though creative books as a group had distinctive features, and creative books by men and by women showed "sex-appropriate" characteristics. On the basis of cluster analyses, 3 types of creative fantasy by male authors were identified: heroic, tender, and comic. 2 types by women authors were identified, one emphasizing independence and the other contact with the irrational and tender emotion. The less creative books did not fit these types. The patterns are interpreted in terms of relationships between the ego and unconscious, and interactions with the maternal matrix, archetypes, and society. (19 ref.)—*Journal summary.*

6339. **Hood, Ralph W. & Ginsburg, G. P.** (South Dakota State U.) **Connotative similarity of Remote Associates Test items as a function of their cultural availability.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 127-130.—Investigated the connotative similarity of Remote Associates Test (RAT) items as a function of their cultural availability using 32 undergraduates as Ss. It was demonstrated that RAT items whose correct answers are readily available in the culture as associative responses to the stimulus terms comprising their respec-

tive RAT items are more connotatively dissimilar than RAT items whose correct responses are not so readily available. The implication that the RAT is a heterogeneous instrument requiring a variety of cognitive processes is discussed. (15 ref.)—*Journal abstract.*

6340. Khatena, Joe. (Marshall U.) **Training college adults to think creatively with words.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 279-281.—Randomly assigned 101 college Ss to 4 treatment groups of equal number and exposed them to 5 creative thinking strategies. Practice increased the probability of the occurrence of original responses as measured by 2 scales or originality: onomatopoeia and images, and sounds and images.—*Journal abstract.*

6341. Raia, James R. & Osipow, Samuel H. (Ohio State U.) **Creative thinking ability and susceptibility to persuasion.** *Journal of Social Psychology*, 1970(Dec), Vol. 82(2), 181-186.—Tested the hypothesis that people high in creative thinking ability are more difficult to persuade than low creative thinkers. 29 8th graders were tested on a variety of creative thinking instruments and subjected to a persuasive appeal. Results indicate that highly creative Ss were more highly susceptible to persuasion than less creative Ss. Additional data suggested a relationship between nondogmatism and creativity which could account for the findings.—*Journal summary.*

6342. Schaefer, Charles E. (Fordham U., Creativity Center) **Development of an originality scale for the Franck Drawing Completion Test.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 402.—Developed an originality scale for the 1st 12 items of the Franck Drawing Completion Test (FDCT). The scale was applied to the FDCT protocols of 800 adolescents grouped relative to a 3-way classification system involving creative achievement, field of interest, and sex. In all criterion-group comparisons, creatives scored significantly higher than controls, indicating that the Originality scale is an effective measure for identifying creative adolescents.—*Author abstract.*

6343. Schmidt, Harald E. (National Inst. for Personnel Research, Johannesburg, South Africa) **Spatial creativity in second year architecture students.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 561-562.—Administered 3 creativity tests to a predominantly male group of 41 2nd-yr architecture students. The tests were Consequences Test, a test of verbal creativity and critical thinking; Preconscious Activity Scale, a measure of the personality aspects of creativity; and the newly designed Common Elements, which is intended to test creativity in the spatial field. Positive rs among the measures were obtained; r between the Consequences Test and the newly designed Common Elements Test was significant ($p < .01$), suggesting common components. However, the measures of creativity do not correlate significantly with academic success.—*Journal abstract.*

PERSONALITY MEASUREMENT

6344. Aberman, Hugh M. & Chansky, Norman. (Shippensburg State Coll.) **Factor analysis of two personality tests with differing conceptual frameworks.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 475-480.—Administered the 16 PF, a nomothetic personality test, and the Runner Studies of Attitudes, an ideographic personality test, in counterbalanced order to 122 graduate students. Intercorrelations among the

subtests were computed and then factor analyzed. 6 factors extracted were named anxiety, counter-dependence, extroversiveness, control, experimental attitude, and emotional independence. Though conceived in different psychometric frameworks, the 2 tests share common psychometric components.—*Journal abstract.*

6345. Abma, Barbara M. (Ohio State U.) **Changes in construction of parent and child figures following enactment: Playing a role.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 909.

6346. Brozovich, Richard. (Oakland Schools, Pontiac, Mich.) **Fakability of scores on the Group Personality Projective Test.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 143-148.—The Group Personality Projective Test (GPPT) was administered under 3 conditions: routine administration, faked emotionally disturbed, and faked well adjusted. Ss were 38 graduate students in education who were not sophisticated in the area of group personality tests. Results indicate that this sample was able to fake both poor and good personality patterns on the GPPT. Most scores on the GPPT under the faking conditions changed in directions that agreed with predictions based on the underlying theory of the test. A subanalysis of the data revealed that total score on the GPPT may be unduly influenced by a small proportion of responses.—*Author abstract.*

6347. Cook, Patrick E. & Josephs, Paula O. (Florida State U.) **The Community Adaptation Schedule and the California Psychological Inventory: A validation study with college students.** *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 366-373.—Studied the construct validity of the Community Adaptation Schedule (CAS) and the CPI in an experiment with 57 undergraduates. Scores on the 2 instruments were correlated and a factor analysis performed. Results give further evidence for the construct validity of the CAS and indicate that the community-adapted person is personally well adjusted as measured by the CPI.—*Journal abstract.*

6348. Ginsburg, G. P. & Hood, Ralph W. (U. Nevada) **Water Jar and Remote Associates Test performances: An associative clustering interpretation.** *Journal of Experimental Research in Personality*, 1970(Oct), Vol. 4(4), 286-290.—Predicted that undergraduates ($N = 16$) who perform well on those 10 Remote Associates Test (RAT) items whose answers are readily available as verbal associates to their item stimuli would do relatively poorly on the Water Jar Test. The prediction was supported: the relevant partial correlation between solution time on the critical Water Jar problem and errors on the high-availability RAT items was $-.55$ ($p < .05$), accounting for 31% of the variance. Results are consistent with the contention that Ss who perform well on the high-availability RAT items are likely to have a comparative disadvantage on problems whose solution is facilitated by recognition of patterns and clear switches in strategy. This is discussed within a conceptual framework of overlap among associative clusters.—*Journal abstract.*

6349. Greenwald, Herbert J. & O'Connell, Stephen M. (Massachusetts State Coll., Bridgewater) **Comparison of dichotomous and Likert formats.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 481-482.—In an experiment with 45 graduate students, it was found that responses to true-false and Likert forms of the Marlowe-Crowne Social Desirability scale correlated significantly. It is suggested that the higher precision of the Likert format

can be used to reduce the number of items of lengthy dichotomous inventories.—*Journal abstract.*

6350. Greenwald, Herbert J. & Satow, Yoichi. (Massachusetts State Coll., Bridgewater) **A short social desirability scale.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 131-135.—Ss' desire to look good, a form of social desirability responding, can powerfully affect their responses. When time is limited, it would be helpful to have a brief measure of this artifact. Such a measure was formed from the Marlowe-Crowne Social Desirability scale and other social desirability items by ranking Likert item-total correlations and then pairing each positively keyed item with a negatively keyed item of corresponding rank. The Likert and dichotomous formats were administered 1½ hr. apart to 103 Ss. Inventories of 2-38 items resulted, together with a possibility of producing more than 1 scale of equivalent internal consistency.—*Journal abstract.*

6351. Greenwald, Herbert J. & Selle, Elaine D. (Massachusetts State Coll., Bridgewater) **Responses to intact and intermixed personality inventories.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 365-366.—Examined whether social desirability responding may heighten when personality inventories are intact by administering intact and intermixed personality measures of respect for others and self-confidence with a measure of social desirability. 161 rural high school students served as Ss. Intact inventories correlated higher with social desirability than intermixed inventories. However, the effect was mild and could possibly be attributed to an inventory response set.—*Journal abstract.*

6352. Hettich, Paul I. & Walker, Ronald E. (Loyola U., Chicago, Ill.) **Effects of experimenter absence and subject briefing on social desirability scale scores.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 372-375.—Investigated the effects of 2 methodological variables, briefing-debriefing and E presence-absence on Ss' test-taking performance. 200 college males were randomly assigned to 1 of the 4 conditions and administered the Marlowe-Crowne Social Desirability Scale (SDS). Those Ss tested under the E-absent condition obtained a significantly lower SDS score than those in the E-present condition ($p < .01$). The main effect of S briefing-debriefing and the interaction were not significant. Results are discussed in terms of their relevance for both clinical testing and research methodology. (19 ref.)—*Journal abstract.*

6353. Kroger, Rolf O. & Turnbull, William. (U. Toronto, Ontario, Canada) **Effects of role demands and test-cue properties on personality test performance: Replication and extension.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 381-387.—Replicated earlier findings by R. O. Kroger (see PA, Vol. 41:10466), to test the hypothesis that the situation affects test performance by generating a set of role demands. 2 randomly constituted groups ($N = 22$ each) of community-college students described themselves on the SVIB, MA scale, and Welsh Figure Preference Test after being exposed to implicit social cues intended to induce differential role taking. Highly reliable, role-specific response differences were obtained on the 3 tests which increased when controls for accuracy of role perception and for test-cue properties were introduced. The previous results were successfully replicated over different Ss, different Es, and an additional test under conditions of improved control over extraneous variables. Findings are interpreted as

supporting the hypothesis and as extending its generality.—*Journal abstract.*

6354. Marke, Sven & Gottfries, Ingrid. (Lund U., Sweden) **Measurement of sex role perception and its relation to psychological masculinity-femininity.** *Psychological Research Bulletin, Lund U.*, 1970, Vol. 10(5), 33 p.—Describes the construction of scales for measuring sex role conception for boys and girls and for husband and wife in a family. A factor analysis of the subscales results in 4 factors which are in some degree similar to masculinity-femininity factors earlier described. The empirical correlation between measures of the sex role factors and measures of the masculinity-femininity factors are in the expected direction, but rather low. There seems to be a sex difference in the correlation structure: In men a conservative sex role perception seems to be related to high masculinity in interests (rejection of feminine interests and activities). In females a radical sex role perception seems to be related to a tendency to describe oneself as tough, aggressive, and dominant.—*Journal abstract.*

6355. Miklich, Donald R. **Item ambiguity in the Authoritarianism scales.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 414.—Tested the relative ambiguity of items in the Authoritarianism scales—the California F Scale and Rokeach's Dogmatism (D) scale. Undergraduate judges rated the ambiguity of each item and compared them to ratings of 16 other scales (3 known to be uncontaminated by response sets and 13 of unknown contamination). Results indicate the F and D scale items to be much more frequently judged ambiguous.—P. McMillan.

6356. Millimet, C. Raymond. (U. Nebraska, Omaha) **Manifest Anxiety-Defensiveness scale: First factor of the MMPI revisited.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 603-616.—A 63-item form for men and 59-item form for women of the Manifest Anxiety-Defensiveness (MAD) scale resulted from 3 separate item analyses performed on a 243-item composite scale obtained by pooling 10 scales purported to reflect anxiety and defense. A factor analysis of these 11 scales yielded 2 clearly identifiable factors, with the MAD scale defining the 1st factor. The MAD scale was shown to possess very high reliability and several studies considering normal and psychiatric samples indicated satisfactory validity. Substantive and stylistic interpretations of the MAD scale are discussed in terms of the 1st factor of the MMPI. It is concluded that the MAD scale best reflects a bipolar dimension of anxiety and defense. (45 ref.)—*Journal abstract.*

6357. Roubertoux, Pierre. (Centre National de la Recherche Scientifique, Paris, France) **Personality variables and interest in art.** *Journal of Personality & Social Psychology*, 1970(Dec), Vol. 16(4), 665-668.—Administered the Guilford-Zimmerman Personality Questionnaire and the Cattell Institute for Personality and Ability Testing Anxiety Scale in order to explore the personality of 3 contrasting groups of 27 high school students each: people interested in the theater but no other artistic pursuits; people interested solely in the visual art; and people interested in no form of art. Differences between the 3 groups were obtained on a number of 16 scales. It appears that there is a central set of variables which direct a person towards art in general. The set is accompanied by a greater number of personality variables determining interest in 1 form of art rather than another.—*Journal abstract.*

6358. Rudinger, Georg & Feger, Hubert. (U. Bonn,

Psychological Inst., W. Germany) **Die Beurteilung formaler Verhaltensmerkmale durch Rating-Skalen: Eine Generalisierbarkeitsstudie.** [The judgment of formal behavior characteristics based on rating scales: A study of generalizability.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(2), 96-112.—Ratings of formal aspects of behavior, e.g., activity, mood, and adjustment, were analyzed on the basis of a 9-point rating scale developed by Thomae. Probands were a sample of 222 60-77 yr. old Ss who were tested in 3 consecutive yr. Results were highly reliable (average coefficient of generalizability = .91). The analysis of data takes into account interindividual differences and can show longitudinal changes based on the scales. (English summary)—*R. F. Wagner.*

6359. **Schoenfeld, Lawrence S.** (U. Texas, Medical School, San Antonio) **Construction of a personality inventory through Thurstone scaling of daydreams.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 678.—Used an empirical technique to construct a personality inventory. Daydreams were chosen as the medium in which certain personality variables were reflected, and the Thurstone scaling method of equal-appearing intervals served as the technique for scaling the daydreams and constructing the inventory. This scaling resulted in the formulation of a daydream inventory which has 9 scales. Reliability and validity of the daydream inventory are assessed.—*Author abstract.*

6360. **Wohl, Julian & Palmer, Albert B.** (U. Toledo) **Correlations between Adjective Check List and Edwards Personal Preference Schedule measures of Murray's needs.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 525-526.—Presents data for 3 university student groups ($N=76, 46, 77$) showing relationships between the Adjective Check List and the EPPS scored for 15 of the needs described in an earlier study by H. A. Murray. A considerable number of significant correlations of low absolute value were found. In general, the 2 measures seem empirically to have very little common meaning.—*Journal abstract.*

6361. **Wulff, David M.** (U. Michigan) **Varieties of temporal orientation and their measurement.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 907-908.

Inventories

6362. **Chodorkoff, Bernard & Cooke, Gerald.** (Sinai Hosp., Detroit, Mich.) **Development of an inventory to measure psychosexual development.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 186.—Reports the development of the Psychosexual Stages Inventory, "a self-report, objectively scored, inventory... capable of assessing and designating in a hierarchical fashion the psychosexual stages which most influence an individual's character, behavior, values, and attitudes." Reliability coefficients on test-retest over a 3-wk period with 32 Ss were oral = .74, anal = .62, phallic = .81, genital = .86.—*M. West.*

6363. **Kramer, Ernest & Aronovitch, Charles D.** (U. South Florida) **Voice expression and rated extroversion.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 426-427.—18 undergraduates listened to neutral and emotional passages recorded by 22 speakers who had taken the Eysenck Personality Inventory (EPI). The estimates of extroversion arrived at by the 18 listener-judges did not

correlate significantly with the EPI measure of extroversion. Despite this lack of criterion validity, some voices were clearly and reliably rated as more introverted or extroverted than others. The judges' own degree of extroversion was not a significant factor in the judgments.—*Journal abstract.*

6364. **Manosevitz, Martin.** (U. Texas) **Item analyses of the MMPI Mf scale using homosexual and heterosexual males.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 395-399.—Performed item analyses of individual MMPI Mf items with total Mf score and an external criterion of homosexuality/heterosexuality. In Group 1 there were 49 heterosexuals and 49 homosexuals, and in Group 2 there were 40 heterosexuals and 40 homosexuals. The analysis of individual items with total score showed that 31 items were significantly associated in both groups. The analysis of individual items with the external criterion shows that in both groups 13 items were significantly correlated with sexual orientation. In Group 1 the correlation between total Mf score and sexual orientation was .72 and in Group 2 it was .30.—*Journal abstract.*

6365. **Salas, R. G. & Jones, P. R.** **A balanced version of the Leary Interpersonal Checklist.** *Australian Psychologist*, 1969(Mar), Vol. 3(3), 181-185.—Reports the production of an apparently improved Leary Interpersonal Checklist (ICL), constructed to correct the original item order which as suggested by the constructors of the checklist results in an uneven distribution of items representing the various ICL octants. Based on data from 1000 20-yr-old national service trainees, a table of tentative norms claimed to be more generally representative of the Australian male population than those presently available is presented.—*Journal abstract.*

6366. **Sciortino, Rio.** (Stevens Inst. of Technology) **Personality Characteristics Inventory: I. Factor structure for a combined sample of male and female college students.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 619-622.—Performed a principle components analysis on the self-ratings obtained from the Personality Characteristics Inventory ($N=941$ undergraduates). The obtained principal components were then rotated according to the varimax procedure. The varimax factors obtained were independence, purposefulness, imagination, knowledge, self-regard, diversion, wonder, self-honesty, logicity, innovativeness, and self-awareness.—*Journal abstract.*

6367. **Vélez de Pava, Margot.** (National U., Bogotá, Colombia) **Inventory multifásico de la personalidad (MMPI): Construcción de una escala T en 500 estudiantes de universidad.** [Multiphasic Personality Inventory (MMPI): Construction of a T scale for 500 university students.] *Revista de Psicología*, 1967, Vol. 12(1-2), 41-54.—500 male and female freshmen were given the MMPI and T score profiles were constructed. There were large differences between the American and Colombian profiles. The Colombian T scores were much higher, especially on the Pa and Sc scales. To avoid misinterpretation in the direction of pathology, it is recommended that MMPI results obtained with Colombian Ss be compared with the results obtained in the present study rather than the American norms.—*L. Zusne.*

Projective Techniques

6368. **Bowyer, Laura R.** (U. Glasgow, Scotland) **The**

Lowenfeld World technique: Studies in personality. Oxford, England: Pergamon Press, 1970. xiv, 223 p. \$6.50(cloth), \$4(paper).

6369. **Carvalhoes Bonilha, Lúcia.** (Pontifica Universidade Católica de São Paulo, Brazil) **Resultados de um grupo universitário de São Paulo no teste das Pirâmides Coloridas.** [Results of a college's group (São Paulo-Brazil) in the Color Pyramid Test.] *Revista de Psicologia Normal e Patológica*, 1968(Jul), Vol. 14(3-4), 147-163.—Presents results from 32 male and 38 female 20-30 yr. olds in relation to: (a) choice of color and syndromes and elements of the process formula; (b) pyramid forms; and (c) elements of construction including direction, mode, changes, and time. Results are compared with adult groups studied in France, Germany, Italy, and another Brazilian group. (French summary)—*English summary.*

6370. **Davreux, Léon.** (Centre Consultatif pour les Études, Louvain, France) **Quelques réflexions sur le test de Rosenzweig.** [Some reflections on the Rosenzweig Test.] *Revue de Psychologie et des Sciences de l'Education*, 1969, Vol. 4(4), 448-454.—Examines positive and negative aspects of the Rosenzweig Picture Frustration (PF) Test, noting that favorable points include thought order and general methodology, while unfavorable points include technical and practical considerations, especially obsolescence. The PF forms for adults is criticized in the following areas: (a) relation between stimulation and reality, (b) index of group conformity, (c) representation of various response categories, (d) the intensity of frustration induced by different situations, (e) types of dyads, (f) patterns of responses, and (g) norms.—*P. Hertzberg.*

6371. **Depuydt-Berte, R.** **Propos sur le T.A.T.** [Observations on the T.A.T.] *Revue de Psychologie et des Sciences de l'Education*, 1969, Vol. 4(4), 413-424.—Attempts to clarify misunderstandings and ambiguities about the TAT with references to research by H. A. Murray and V. Shentoub. The question of to what degree psychoanalytic interpretation may depend on material gathered in a thematic apperception test is considered. The importance of form and content analysis of the TAT is discussed as well as quantitative analysis with respect to number codification and psychograms. Comparisons are made with the Rorschach. It is suggested that the TAT should not be used for routine psychoanalytic cases, but for those which require profound study. (16 ref.)—*P. Hertzberg.*

6372. **Eisenman, Russell & Foulks, Edward F.** (Temple U.) **Usefulness of Mussen's TAT scoring system: I. Differences among Guatemalan Indians, Ladinos, and Mengalas on a modified TAT. II. Attitudes toward the physically disabled as related to nurturance and deference.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 179-185.—2 studies demonstrate use of P. H. Mussen's (see PA, Vol. 28:2443) TAT scoring system. In Study I a modified TAT, designed to fit the culture of Guatemala, was administered to 57 Guatemalans, including 34 Indians, 17 Ladinos, and 6 Mengalas. It was hypothesized that, comparing Indians and Ladinos, Ladinos would have higher need achievement and higher need autonomy, while Indians would have higher need affiliation. Press lack and press physical danger were predicted to be frequent themes, consistent with the difficulties in living experienced by all 3 groups. Also, based on a recent conceptualization, minimal differences were expected on other scoring

categories utilized. Data are consistent with hypotheses. In Study II, 20 undergraduates scoring high on need Nurturance 2 and 20 other undergraduates scoring high on Need Deference 2 verbalized their feelings about the physically disabled. Both groups were significantly likely to verbalize positive attitudes, but the Need Deference 2 Ss were also significantly likely to verbalize "stereotyped favorable" attitudes, which are interpreted as being less than fully positive.—*Journal abstract.*

6373. **Fetler-Sapin, Marie F.** (Centre Consultatif pour les Études, Louvain, France) **Une épreuve d'expression graphique: Le test de Wartegg.** [A test of graphic expression: The Wartegg Test.] *Revue de Psychologie et des Sciences de l'Education*, 1969, Vol. 4(4), 437-447.—Examines the theoretical aims of E. Wartegg concerning the utility of his test. Wartegg is regarded as a representative of the total personality, defined by 2 poles: integration and disintegration. The influence of Gestalt psychology on his theories is discussed along with his structural definition of character. Although the Wartegg Test is considered to be a useful instrument for psychoanalytic study of the personality, difficulty is seen in determining the level of personality investigated because Wartegg does not base his theories on an established system or theory. The test is considered to evoke the self-image of the S through conscious associations with reality. Comparisons with the Szondi Test are made.—*P. Hertzberg.*

6374. **Masling, Joseph & Harris, Sandra.** (State U. New York, Buffalo) **On alternative interpretations of experimental findings: A reply to Wolf.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 330-331.—Compared M. G. Wolf's (see PA, Vol. 45:Issue 4) interpretation to the authors' interpretation of the data, which makes fewer assumptions and discards fewer data than Wolf's and is able to integrate the results of several different types of experiments.—*Journal abstract.*

6375. **Monod, Mireille.** **"Le test du Village": Interprétation de la création projective a propos du test et du retest.** ["The Village Test": Interpretation of creative projection through test and retest.] *Revue de Psychologie et des Sciences de l'Education*, 1969, Vol. 4(4), 381-412.—Administered the Village Test to 3 boys, aged 8, 10, and 11, of above average intelligence in order to examine the value of the interpretation of creative projection (those reactions evoked by a stimulus object which has been proposed by a psychologist). Ss were retested after intervals of 26, 15, and 13 mo., respectively. Ss were also psychologically evaluated by the WISC, the Rorschach, a thematic test, and drew pictures on a given theme and on a free theme. The lengthy time intervals between Village tests enabled evaluations to be made of transference processes intervening in the test situations. It is proposed that the test-retest situation shows that objectivity of an S's response to the same stimulus is subject to transference factors which may be psychoanalytically interpreted. Test illustrations are included.—*P. Hertzberg.*

6376. **Murstein, Bernard I.** (Connecticut Coll.) **Points de vue récents concernant l'ambiguïté dans le T.A.T.** [Recent points of view concerning ambiguity in the T.A.T.] *Revue de Psychologie et des Sciences de l'Education*, 1969, Vol. 4(4), 425-436.—Reviews studies of the TAT which show that the most ambiguous drawings are the least useful in personality evaluation. It is theorized that because the majority of human

experience is based on interpersonal interactions, the most effective pictures involve 2 or more persons and are concerned with what is happening between them. Functions of age and sex in TAT pictures are also discussed, noting the importance of projection. It is suggested that projection may be encouraged by questions on why a person has arrived in a picture and how the picture story ends.—P. Hertzberg.

6377. Raynolds, Peter A. (U. California, Los Angeles) **The projective-differential: A general-purpose inkblot technique for studying denotable "objects."** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 521.

6378. Swartz, John D., Witzke, Donald B., & Megargee, Edwin I. (U. Texas) **Normative item statistics for the group form of the Holtzman Inkblot Technique.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 319-329.—To assist investigators who wish to use the group form of the Holtzman Inkblot Technique (HIT) in innovative ways, normative item statistics were obtained from 350 adults for all 90 HIT inkblots (Forms A and B) on the 20 variables that are hand-scored on the standard group version of the technique.—*Journal abstract*.

6379. Wolf, Martin G. (Personnel Research & Development Corp., Cleveland, O.) **An alternative interpretation of Masling and Harris' study on the sexual aspects of TAT administration.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 328-329.—J. Masling and S. Harris (see PA, Vol. 43:9855) interpreted their findings on the relative frequency of usage of TAT Cards 4 and 10 as being indicative of voyeuristic personal-sexual needs on the part of male graduate student Es intruding into a serious clinical situation. Their findings are felt to violate the principle of parsimony and to cast unwarranted aspersions on the students who served as Es. Data are reinterpreted as showing that the male students were simply applying sound clinical principles in an attempt to do as well as possible on the task given them.—*Journal abstract*.

Rorschach Test

6380. Cassiers, Léon & Cassiers, Axelle. **Comment codifier l'interprétation symbolique du Rorschach?** [How to codify the symbolic interpretation of the Rorschach.] *Revue de Psychologie et des Sciences de l'Education*, 1969, Vol. 4(4), 366-380.—Discusses problems and considerations involved in codifying the Rorschach for statistical analysis. The codification process is deemed feasible according to 3 hypotheses: (a) certain levels of the Rorschach may be considered to have a stable symbolic value; (b) every Rorschach response has a meaning, i.e., it symbolically expresses something of the subconscious transference S-examiner relationship and the subconscious affective structure of the S; and (c) in a given culture, a certain number of symbols are stable or common to everyone. An example is given to show that symbolic interpretation has more than a diagnostic and prognostic value. Also, (a) the type of reality to which a symbol belongs, (b) an agreeable, disagreeable, or neutral type of symbol, and (c) the level of symbolic elaboration are revealed.—P. Hertzberg.

6381. Morali-Daninos, A. & Cerf, F. **Les aspects dimensionnels de la personnalité dans le**

Rorschach. [Dimensional aspects of personality in the Rorschach.] *Revue de Psychologie et des Sciences de l'Education*, 1969, Vol. 4(4), 333-365.—Examines primary, secondary, and tertiary dimensions which elaborate structural and diagnostic elements in the Rorschach. A synthetic psychogram is proposed in which a quantification of personality variables is established, 15 personality dimensions are suggested. These include the classic Rorschach dimensions, 4 proposed dimensions (aspirations—global vision, conscious attention and realizations, emotions and their development, and compensations and defenses), and 5 complementary dimensions (life forces, vital principles, corporeal-visceral schema, human contact, and construction of the abstraction technique). The application of the technique is illustrated by excerpts of case studies which show the versatility of the synthetic psychogram in outlining personality dimensions.—P. Hertzberg.

6382. Pethő, Bertalan. (U. Budapest, Hungary) **Zur wissenschaftlichen Grundlegung des Rorschach Tests: I. Forschungstendenzen des Rorschach-Tests auf Grund ihrer Relationssysteme.** [On the scientific foundation of the Rorschach test: I. Tendencies to investigate the Rorschach test according to theoretical orientation.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(2), 296-315.—As a 1st step in building a scientific framework for the Rorschach test, the theoretical position of different "schools" of interpretation is explored. 5 of these are discussed: interpretation based on association theory, search for syndromes, content interpretation, and comparative and experimental investigations. (English & French summaries) (54 ref.)—W. J. Koppitz.

6383. Sal y Rosas, Federico. **Ubicación de las áreas respuesta en el espacio de las láminas de Rorschach.** [Positions of areas of response on the Rorschach sheets.] *Revista de Psiquiatria y Psicología Médica*, 1969(Apr), Vol. 9(2), 85-96.—Examines the frequency of exterior or interior, lateral or median, upper or lower positions of response to the Rorschach test of 1696 normal Ss of Peru. Ss were divided into groups according to age, sex, cultural level, and geographic region of habitat (mountain or coast). It is concluded that: (a) exterior areas were more frequent than interior ones, lateral more than median, and upper more than lower; (b) each of these differences had the same ratio on the basis of all cases and each of the individual groups; and (c) a comparison of numbers and graphs in 11 human groups showed significant differences. For example, the most frequent positions (exterior, lateral, upper) reached a higher percentage in those groups which could be qualified as intellectually, culturally, and socially inferior (e.g., illiterate peasants) whereas the infrequent positions (interior, median, and lower) were higher in selected groups (e.g., medical students); (d) the tendency to select a particular area of response on Rorschach sheets is related to psychological qualities; and (e) the criteria of spacial position should be included in the classification of responses to the Rorschach test.—S. Maze.

6384. Saraceni, D. **Dinamica della proiettività in situazione ipnagogico-simile.** [Dynamics of projection in a hypnagogic-like situation.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1969(Mar), Vol. 30(2), 97-113.—Performances of 16 undergraduates on the Rorschach under hypnagogic conditions showed an increase in M and FM responses.—L. L'Abate.

CLINICAL PSYCHOLOGY

6385. ———. **Dzhon Rouling Rls. Zhurnal Nevropatologii i Psikiatrii**, 1970, Vol. 70(3), 475.—Recounts the life and work of D. R. Ris (1890-1969), who contributed to the organization of international collaborative efforts in psychiatry.—*I. D. London.*

6386. ———. **Mental health book review index: An annual bibliography of books and book reviews in the behavioral sciences: Cumulative author-title index: Volumes 1-12, 1956-1967.** New York, N.Y.: New York U., Council on Research in Bibliography, 1969, iv, 178 p. \$15.—"Out-growth of an effort to develop a broadly based method of identification, selection, and synthesis for the monographic literature in the behavioral sciences," with a concentration in the psychological sciences. 3 functions are suggested: (a) as an index to the listings of 3885 books and 22,000 review citations, (b) as a checklist for significant books in the behavioral sciences and a key to multiple reviews, and (c) as an instrument of research into the creation and evaluation of this literature. In the cumulated alphabetical listing, cross-references from the names of second authors or editors have been added.—*L. Goldberger.*

6387. **Akesson, H. O. & Olanders, S.** (U. Gothenburg, St. Jörgen Hosp., Sweden) **Frequency of negative sex chromatin among women in mental hospitals. Human Heredity**, 1969, Vol. 19(1), 43-47.—Screening the 3558 female inmates of 9 Swedish mental hospitals for sex chromatin revealed only 1 S with an XO complement. This rate, .03%, does not differ from the predicted normal rate. (28 ref.)—*Journal summary.*

6388. **Alema, Giovanni, et al. (Eds.)** (Hosp. of S. Camillo de'ellis, Div. of Neurology "Lancisi", Rome, Italy) **Brain and mind problems: A jubilee volume in honour of Prof. Mario Gozzano.** Rome, Italy: "Il Pensiero Scientifico," 1968, xxxiv, 1453 p.

6389. **Benezra, E. Elliot.** (U. Illinois, Medical School) **Psychiatry in modern Turkey: Old ties and new trends clashing and blending. Psychiatric Quarterly Supplement**, 1968, Vol. 42(1), 101-115.—Describes the historical background and the multiple cultural heritage of present-day Turkey. The clashing and blending of ancient Near Eastern folk and Islamic practices with the newly introduced Western psychiatric methods are emphasized. Details of the main government, university, and private psychiatric facilities are reported. It is also noted that among the predominant Kraepelinian psychiatrists in Turkey, there is the slowly developing influence of dynamic interpersonally-oriented psychiatrists trained in the United States.—*Journal summary.*

6390. **Bolman, William M.** (Westside Community Health Center, San Francisco, Calif.) **Systems theory, psychiatry, and school phobia. American Journal of Psychiatry**, 1970(Jul), Vol. 127(1), 25-32.—Applies aspects of systems theory, i.e., subsystems, feedback, and goal-directedness, to the clinical condition of school phobia, and discusses implications for diagnosis, therapy, and training. Clinically, a systems approach to a child showing school phobia is described as consisting of: (a) estimating the relative contribution of the different system levels including the child and the sublevels of neurological and psychological structure, the family and its patterns of parental roles and communication, the school, and the community; (b) deciding

which levels provide the most likely points of leverage for change; (c) approaching these points of leverage so as to evoke cooperation for primary levels, minimize non-cooperation from other levels, and keep communications open; and (d) collecting multilevel data to develop therapeutic approaches which fit the problem's complexity. It is suggested that although the clinical applications of a systems approach in psychiatry are still remote, it is a highly useful approach for theory and practice in both individual and population aspects. (47 ref.)—*P. R. Shibelski.*

6391. **Buyanov, M. I.** (Central Inst. for Advanced Medical Training, Moscow, USSR) **Voprosy deprivatsii v detskoj psikiatrii.** [Problems of deprivation in child psychiatry.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 453-462.—Surveys the non-Soviet literature of the last decade on the various problems posed by affective and social deprivation in child psychiatry. (109 ref.)—*I. D. London.*

6392. **Clark, Gerald R., Telfer, Mary A., Baker, David, & Rosen, Marvin.** (Elwyn Inst., Pa.) **Sex chromosomes, crime, and psychosis. American Journal of Psychiatry**, 1970(May), Vol. 126(11), 1659-1663.—Attempted to disprove (or further substantiate) the belief that men with XYY chromosomes are more prone to violence. A comparative study was conducted using men with XYY chromosomes and men with the Klinefelter syndrome (XXY). Using males from hospitals for the criminally insane and from institutions for defective delinquents, mental patients and mentally retarded, a small group of XYY males and those with Klinefelter's syndrome were analyzed and compared. The average height of the XYY male is 76 in., and body configuration appears normal for the height. It is concluded that there seems to be no link between the XYY males and violent criminal behavior. There appears to be little difference between the XYY male and the Klinefelter male. The XYY male's antisocial nature and tendency to violent crime is possibly attributable to his "fearsome height." Sex chromosome abnormality may influence psychosocial adjustment but other factors also may do so, hence psychopathology and criminal behavior is not an inevitable deviance. (18 ref.)—*P. R. Shibelski.*

6393. **Costello, Charles G. (Ed.)** (U. Calgary, Alberta, Canada) **Symptoms of Psychopathology: A handbook.** New York, N.Y.: John Wiley, 1970, 679 p.

6394. **Doehring, Donald G. & Rabinovitch, M. Sam.** (McGill U., Montreal, Quebec, Canada) **Auditory abilities of children with learning problems. Journal of Learning Disabilities**, 1969(Sep), Vol. 2(9), 467-475.—Compared auditory abilities of 20 6-13 yr. old children with learning disabilities with those of 35 normal-learning children. Ss with learning problems were within normal limits in thresholds for pure tones and speech, and in speech discrimination in both quiet and noise. On a series of auditory oddity tasks, the groups did not differ significantly in loudness discrimination or on the 1st of 2 pitch discrimination tests, but the normal-learning group obtained significantly better scores on a 2nd pitch discrimination test and on tests involving the discrimination of simultaneous tones, successive tones, and speech sounds. Certain differences in the conditions of testing for the 2 groups complicated the interpretation of these results. Pitfalls of testing procedures in this area are noted. It is concluded that more research is needed before the term "auditory perceptual deficit" can be meaningfully applied to

children with learning problems. (17 ref.)—*Journal abstract.*

6395. Dohrenwend, Bruce P. & Crandell, Dewitt L. (Columbia U., Coll. of Physicians & Surgeons) **Psychiatric symptoms in community, clinic, and mental hospital groups.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1611-1621.—Queries whether or not symptomatology of substantial portions of the general population resemble that seen in the psychiatric patient. Responses to a questionnaire about 46 symptoms show that quantitative resemblance exists. Further care in classification of the seriousness of each "symptom" was taken as was care in selection of the Ss. 248 community leaders, adult heads of families, outpatients, and psychiatric patients were chosen from within the Washington Heights section of New York City. In order to acquire a fair estimate of the seriousness of each symptom, local psychiatrists and interns rated each item/symptom. Data obtained was consistent with portions of the 2 previous studies, showing a small portion of the general population having the various symptoms judged serious by the psychiatrists and interns.—P. R. Shibelski.

6396. Editorial Committee & Contributing Librarians. **Mental health book review index: An annual bibliography of books and book reviews in the behavioral sciences.** *Council on Research in Bibliography*, 1969, Vol. 14(19), 92 p.—Lists 300 books with references to multiple reviews, at least 1 being from a journal in psychology, psychiatry, or psychoanalysis. This volume extends the entire bibliography to 4491 books with a total of 28,000 references to reviews currently drawn from 210 pertinent journals in the English language. Included is an editorial on "Intensive bibliography" and the growth pattern of the literature in the behavioral sciences" which suggests basing "intensive bibliography" on an advanced level of concentration of knowledge often found in literature reviews and other "secondary" publications and illustrates how a bibliography of book reviews in the behavioral sciences, by applying the principle of selective representation, can itself become an intensifying device.—L. Goldberger.

6397. Editorial Committee & Contributing Librarians. **Mental health book review index: An annual bibliography of books and book reviews in the behavioral sciences.** *Council on Research in Bibliography*, 1970, Vol. 15(20), 87 p.—Lists 300 books with references to multiple reviews, with at least 1 being from a journal in psychology, psychiatry, or psychoanalysis. This volume extends the entire bibliography to 4793 books with more than 30,000 references to reviews currently drawn from 250 pertinent journals. Included also is a pilot bibliography of 124 lectures in 65 lectureships, and an editorial on "Lectureships in the behavioral sciences: An introduction to sociobibliography."—M. Maney.

6398. Foulkes, S. H. & Prince, G. Stewart. (Eds.) (Bethlem Royal Hosp., London, England) **Psychiatry in a changing society.** London, England: Tavistock, 1969. xviii, 211 p. \$8.—Presents papers delivered at a 1965 meeting of the Royal Medico-Psychological Association in London. Authors represent the disciplines of anthropology, education, sociology, psychology, ethology, and psychiatry. Papers debate the issue of the extent to which psychiatry can keep pace with the current rapid and radical changes in society.

6399. Freyre, Alfred V. & Flichman, J.C. **Spasmophilia caused by magnesium deficit.** *Psychosomatics*,

1970(Sep), Vol. 11(5), 500-501.—Discusses the effects and causes of magnesium deficit in humans, and postulates that it is "not an isolated and exceptional observation, but is found in everyday practice, when it is systematically sought." Cases of spasmophilia, "identified with the most frequent neuromuscular form of primary magnesium deficit" are discussed, and the symptoms described as "quite varied, associated with central, peripheral, autonomic and trophic manifestations, all of which are nonspecific." Aids in the diagnosis of magnesium deficit (i.e., plasma and red cell level changes, the EEG, and the EMG) are noted. Magnesium deficit in epilepsy, in psychic and physis stress, and in delirium tremens is also discussed. It is concluded that magnesium deficit is often falsely labeled when its symptoms are similar to those of other illnesses. An illustrative case history is presented.—P. McMillan.

6400. Frith, Uta. (Medical Research Council, Developmental Psychology Unit, London, England) **Studies in pattern detection in normal and autistic children: I. Immediate recall of auditory sequences.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 3(76, Pt.1), 413-420.—20 normal, 20 autistic, and 10 subnormal children reproduced from memory binary sequences of the type "spoon horse spoon horse spoon." Autistic Ss achieved good recall in the less redundant sequences, but were relatively impaired in recalling highly redundant sequences. However, this applied only to 10 autistic children with a low memory capacity, while 10 Ss with a high memory capacity achieved the same level of recall as 10 normal Ss. Detailed analysis of errors indicates differences between autistic Ss and the control groups. Even in otherwise incorrectly recalled patterns, normal and subnormal children preserved the dominant role of the presented pattern. This was not found in autistic children, who instead showed a marked response bias. Thus, while the control groups, regardless of development level, showed evidence of feature extraction, autistic children, regardless of development level, showed evidence of input independent pattern imposition.—*Journal abstract.*

6401. Fryers, T., Freeman, H. L., & Mountney, G. H. (U. Manchester, England) **A census of psychiatric patients in an urban community.** *Social Psychiatry*, 1970(Oct), Vol. 5(4), 187-195.—Describes the background and purpose of the Salford Psychiatric Case Register. Initial results are presented of the census in which Salford adults and children, receiving care from hospital or local psychiatric services on January 1, 1968, were enumerated. Distribution by age, sex, type of care, length of stay of hospital inpatients, and contact of patients with medical and social work psychiatric personnel is presented. Comparison is made with data from case registers in other areas. (French & German abstracts) (28 ref.)—*Journal abstract.*

6402. Ivanov, F. I. **O predmete i zadachakh meditsinskih psikhologii.** [On the subject matter and goals of medical psychology.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 462-463.—Presents a negative appraisal of the article on the teaching of medical psychology by V. V. Shostakovich (see PA, Vol. 44:12681).—I. D. London.

6403. Jaffe, Ruth. (Shalvata Hosp., Hod Hasharon, Israel) **Psychiatric classification and theories.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 145-157.—Describes the main features of the models of regression and adaptation with a view to their

possible use for classification. The former is evaluated as dualistic, intrapsychic, and psychopathological, with regression itself as the main pathological process, resulting from disintegration of the higher psychic systems. The adaptive model is evaluated as behavioristic, organismic-holistic, stressing the pathophysiological basis of mental life. It is concluded that as yet a new integrated and consistent classification system is unavailable and that an interdisciplinary recording system has to be created before satisfactory classification will be possible. (19 ref.)—*Journal abstract.*

6404. Kertesz, Robert. (Inst. Privado de Psicologia Medica, Argentina) **Anxiety and depression in medical practice.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 403-405.—Reviews 8 yr. of experience in liaison psychiatry and teaching at a hospital and university polyclinic in Buenos Aires. A schema is presented as a useful approach for nonpsychiatric practitioners, showing psychopharmacological drug effects as either somatic, somatopsychic, or psychosomatic. It is suggested that such physicians are better able to communicate in the area of psychotropic drugs than in the area of psychodynamics because of their prior familiarity with biological approaches to illness and health.—*P. McMillan.*

6405. Levita, Eric & Riklan, Manuel. (St. Barnabas Hosp., New York, N.Y.) **Integrative functions in parkinsonism.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 379-385.—Assessed the effects of neurological involvement upon integrative performance through visual-motor, perceptual, and cognitive test performance of parkinsonian and cardiac patients. A battery of tests was administered 1-3 days following admission to the hospital. No significant differences were obtained between the test results of 32 parkinsonian and 13 cardiac Ss. For parkinsonian Ss no significant variations in higher integrative functions could be attributed to differences in sex, age, extent of voluntary movement impairment, and laterality or severity of neurological involvement. Degree of autonomic nervous system impairment was related to psychological performance only in 1 test (Odd Words Test). It is suggested that perceptual-cognitive performance of groups of parkinsonian Ss does not necessarily qualify as organic in the usual psychological sense.—*Journal abstract.*

6406. Mittler, Peter. (Ed.) **The psychological assessment of mental and physical handicaps.** London, England: Methuen, 1970. xx, 857 p.\$25.—Presents a survey of the field of testing and diagnosis of handicapped children and adults. Chapters by various contributors cover intellectual and personality assessment, psychophysiological techniques, evaluation of psychiatric, subnormal, and geriatric patients, the assessment of children with various handicaps, the design of remedial programs, the construction of individual intelligence tests, and an account of recent experiments with automated testing systems.

6407. Owens, Richard T. (U. Nebraska) **A study of the performance of minimally brain-damaged and emotionally disturbed boys on six selected psychological tests.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 383.

6408. Park, George E. (Dyslexia Memorial Inst., Chicago, Ill.) **Ophthalmological aspects of learning disabilities.** *Journal of Learning Disabilities*, 1969(Apr), Vol. 2(4), 189-198.—Synthesizes the visual processes with the concept of homeostasis as applied to other

physiological functions and balances and relates their influences in reading. The significance of a multidiscipline program for diagnosing and treating learning disabilities is emphasized. It is shown that visual functions have a wide range of physiological fluctuations and balances, influenced by stimuli on the sensorimotor system of the whole visual process. Analysis of the peripheral ocular mechanism shows no significant difference between dyslexic and normal readers except in a few cases where ocular functions may be significant in reading failures. It is concluded that when an abnormal but correctable disturbance in cerebation occurs, a functional rather than organic involvement of any definite area is suggested, thus emphasizing the importance of the wide interplay of the various parts of the brain.—*M. Maney.*

6409. Parsons, Oscar A. & Klein, Helen P. (U. Oklahoma, Medical School, Oklahoma City) **Concept identification and practice in brain-damaged and process-reactive schizophrenic groups.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 317-323.—A nonverbal concept identification task involving easy and difficult subtests was given to groups of process and reactive schizophrenic, brain-damaged, and control patients. The same test was administered twice. Brain-damaged and process schizophrenic groups had poorer overall performance than the other 2 groups but did not differ from each other significantly. However, patterns of improvement on the easy and difficult subtests were different for the schizophrenic vs. brain-damaged groups. Implications for "organic" vs. "functional" explanations of process schizophrenia were discussed.—*Journal abstract.*

6410. Ploticher, A. I. **K voprosu o meditsinskoj psikhologii.** [On medical psychology.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 463-464.—Presents an amplification of the article on the teaching of medical psychology by V. V. Shostakovich (see PA, Vol. 44:12681)—*I. D. London.*

6411. Rokhlin, L. L. **Znachenie kategorii "vneshnee" i "vnutrennee" v psikhiiatril.** [Significance of the categories "outer" and "inner" in psychiatry.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 321-328.—Considered the possible relationships between the categories of the outer and the inner in normal psychology, and analyzed the methodological significance of these categories for the study of the clinical picture, etiology, and pathogenesis of mental diseases.—*I. D. London.*

6412. Sheinkopf, Sylvia. (Boston U., School of Education) **Connotative judgments by normals, aphasics, and brain-damaged non-aphasics on a pictorial adaptation of the semantic differential.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 434-435.

6413. Stein, Myron. (Center for Preventive Psychiatry, White Plains, N.Y.) **The function of ambiguity in child crises.** *Journal of the American Academy of Child Psychiatry*, 1970(Jul), Vol. 9(3), 462-476.—Phenomena of vagueness have been traced in communications with children normally and in crisis, and with adults in crisis. A clinical example of the ambiguous handling of a child in a physical crisis situation is described. Defensive mechanisms inherent in handling crises in an ambiguous fashion are discussed, and the phenomenon of pseudostupidity as related to ambiguity is mentioned. The need to be fooled and to fool oneself and others under stress

involves denial and the turning of passive into active. Thus, a state of uncertain helplessness can be foisted on others. Understanding this issue, and using other measures of handling anxiety, i.e., active communication with trusted persons, can be more effective ways of handling crisis situations and are a powerful tool when helping families in crisis. (16 ref.)—*Journal summary*.

6414. Strickler, Edwin. **Family interaction factors in psychogenic learning disturbance.** *Journal of Learning Disabilities*, 1969(Mar), Vol. 2(3), 146-154.—Explores the "role of family interaction factors in the production and treatment of psychogenic learning disturbance." It is proposed that when disturbed family relationships exist, parental authority often appears dictatorial-punitive, permissive-indulgent, or ambiguous-inconsistent. These patterns are reflected in the school learning behavior of the child and are facilitated by a displacement of attitudes and behaviors toward parental authority onto the teacher authority, producing a psychogenic learning disability. The clinical case record of a 13-yr-old boy is presented to illustrate the validity of this proposal, and to demonstrate the efficacy of family-centered therapy procedures as the appropriate modality for diagnosis and treatment of psychogenic learning disability. (15 ref.)—*M. Maney*.

6415. Vande Creek, Leon & Bath, John. (Tri-State Coll.) **A preliminary view of trends in age, education, and intelligence of problem youth.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 219-225.—Previous research has shown that problem youth, as a group, have a slightly lower intelligence level than the population average and are educationally retarded. Data were collected on 332 neglected, dependent, and delinquent youth admitted to a state juvenile home in 1957, 1962, and 1967. Results indicate that average age, intelligence level, and grade placement had increased significantly over the 10-yr span. The need for further research into the effect of these variables upon etiology of juvenile problems is stressed. (17 ref.)—*Journal summary*.

6416. Walsh, John J. (Oneida County Court House, Utica, N.Y.) **Law and psychiatry.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 22-39.—Asserts that it would be desirable to modify legal procedures to facilitate psychiatric communication. The law suspects that psychiatry is not generally sympathetic to the legal process, perhaps because psychiatrists do not understand the problems the law must solve if it is to accomplish its purpose.—*D. Prager*.

6417. Winnik, H. Z. (Talbieh Psychiatric Hosp., Jerusalem, Israel) **Second thoughts about "psychic trauma."** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 82-95.—Reviews the usage of the term "psychic trauma," and discusses the nature of traumatic situations. The distinction between stress and trauma is presented as being vague, the main difference being that trauma is equated with psychic subjective criteria, and stress with external quantifiable criteria. (20 ref.)—*G. Steele*.

PERSONNEL

6419. Beard, Bruce H. & Pishkin, Vladimir. (U. Texas, Southwestern Medical School, Dallas) **Self-concept**

changes in training medical and nursing students. *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 616-623.—Employed the dominance and love dimensions of the Leary Interpersonal Checklist to investigate changes in concepts of self and ideal self that occurred in 72 medical and nursing students and 11 psychiatric nursing assistants during their final year of formal academic education. Major findings are that: (a) there was a significant tendency by all Ss to perceive self as less dominant than ideal self, (b) public health nursing Ss narrowed the gap between self and ideal self, and (c) medical Ss developed greater incongruity between the 2 ratings on dominance measures.—*Journal summary*.

6420. Brengelmann, Johannes C. **La formación del psicólogo clínico: Una propuesta concreta.** [Training of the clinical psychologist: A concrete proposal.] *Revista de Psicología*, 1968, Vol. 13(1-2), 5-15.—Proposes a program for the training of clinical psychologists, reviewing the practices and theories of an international selection of universities. Suggestions are made regarding the qualifications of candidates, training objectives, formal principles of training, a training plan, exams, and financing. References are made to the curriculum plans at Maudsley Hospital in London and at England's Birmingham University.—*P. Hertzberg*.

6421. Brunstetter, Richard W. (U. California, Medical Center, San Francisco) **Community child psychiatry: Description of a training program and comments.** *Journal of the American Academy of Child Psychiatry*, 1970(Jul), Vol. 9(3), 445-461.—Describes an orientation course, conducted over a 5-yr period, in community child psychiatry which utilized "already existing experiences as a foundation, introduced others specifically related to community mental health, added an experience in a Project Headstart Center and an assignment as an agency consultant, and provided a seminar where community experiences could be discussed and related to pertinent readings." The major components of the course are summarized.—*G. Steele*.

6422. Dressler, David M. & Bloom, Sholom. (Yale U.) **Sensitivity training with administrators.** *Gerontologist*, 1970(Sum), Vol. 10(2), 161-162.—A 1-day sensitivity training institute was held for project directors of a state department of aging with the expectation that participants would increase their interpersonal awareness and gain a better understanding of emotional experiences in the elderly. The methods included a series of written exercises, a T group, a nonverbal exercise, and an intergroup exercise. Individuals found the experience to be informative, personally rewarding, and professionally useful. The response of participants suggests that similar institutes might be valuable for the elderly themselves in order to alleviate feelings of interpersonal isolation and loneliness.—*Journal abstract*.

6423. Goldsmith, Stephen R. (U. California, Neuropsychiatric Inst., Los Angeles) **Institutional transference and the psychiatric resident.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 256-259.—Residents develop a transference to their institutions, the nature of which is influenced by their degree of success in effectively coping with the institutional environment. Those residents who are unable to develop feelings of mastery in this area may be expected to have more difficulty in separating from the institution. (15 ref.)—*Journal summary*.

6424. Goodman, Lillian R. (Boston U., School of Education) **A model of objectives for a program of**

continuing education for psychiatric nurses in community mental health work in Massachusetts. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 774.

6425. Grotjahn, Martin. (416 N. Bedford Dr., Beverly Hills, Calif.) **The analytic group experience in the training of therapists.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 108-109.—The analytic group experience is considered a vital part of the training psychoanalysts and psychiatrists should receive. In addition to the transference relationship which can develop in a 1:1 situation, the group experience is said to provide a climate where transference relationships can occur between members and toward the group itself "as a mother." By consistently having group transference phenomenon interpreted, members can free themselves from the "repetition of the family neurosis."—S. R. Greenwald.

6426. Hale, Thomas. (Albany Medical Center Hosp., N.Y.) **Cliches of nursing education.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 40-56.—Presents and refutes 20 cliches current in nurse educationist circles.

6427. Kearney, G. E. & Tucker, J. D. **Psychology in the Australian Citizen Military Forces.** *Australian Psychologist*, 1969(Mar), Vol. 3(3), 163-170.—Describes the development of the Australian Citizen Military Forces Units of psychologists and their relationship with the Army. The recruitment, selection, and training of unit members is discussed, stressing the practical aspects of the training which is designed to supplement university psychology courses. A list of research reports so far published is included.—M. Maney.

6428. Kempler, Walter. (6233 Wilshire Blvd., Los Angeles, Calif.) **The therapist's merchandise.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 57-60.—The therapist's merchandise is "self-disclosure presented with clarity." It is his ability to know and to reveal himself as he is in relation to his patient. It is his own freedom from self-deception. It is his personal power and this power is his merchandise, "manifest presence." Manifest presence is said to be the richness of what the therapist is experiencing and his ability to express that richness. His personality and the discipline he reflects are considered determinants of how he expresses himself.—S. R. Greenwald.

6429. Klachan, Jean & Kalwinski, Helen. (Wellesley Hosp., Toronto, Ontario, Canada) **The nurse's role in the informal group.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Sep), Vol. 6(5), 267-273.—Presents observations of nurses who involved themselves in informal patient groups in a psychiatric ward over a 4-wk period in order to examine their sociotherapeutic role in such groups.

6430. Kurtz, Nancy; Kurtz, Richard, & Hoffnung, Robert. (Washington U.) **Attitudes toward the lower- and middle-class psychiatric patient as a function of authoritarianism among mental health students.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 338-341.—There is evidence that many clinicians' activities with lower-class patients may be influenced more by attitudes reflecting a middle-class orientation than by objective criteria. Authoritarianism seems especially germane to the problems of social class bias. For the evaluative dimension of the semantic differential, it was predicted that lower-class case histories would be judged more negatively by those Ss who were more authoritarian as measured by the

California F Scale. This prediction was confirmed for a group of 24 psychiatric residents and bordered on significance for a group of 16 social work students.—*Journal abstract.*

6431. Lovibond, S. H. (U. New South Wales, Sydney, Australia) **Specialized training in clinical psychology: The experimental approach.** *Australian Psychologist*, 1969(Mar), Vol. 3(3), 140-146.

6432. Nolan, Kenneth J. & Cooke, Edwin T. (U.S. Army Medical Field School, Brooke Army Medical Center, Ft. Sam Houston, Tex.) **The training and utilization of the mental health paraprofessional within the military: The social work/psychology specialist.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 74-79.—Discusses a new program which has developed as a result of the manpower shortages in the social worker/psychologist field within the military. The program entails a 10-wk training session for qualified military men, i.e., those with IQs of 100 or better, and who have some college experience. Objectives are defined as developing the ability to: (a) administer and score selected psychological tests; (b) conduct disciplined purposeful interviews; (c) obtain historical, situational, and observation data; and (d) report pertinent verbal and written findings. It is suggested that this experience with the paraprofessional in broad areas of mental health may be relevant to the problems of utilization and training in a number of civilian areas.—P. R. Shibleski.

6433. Pazdur, Helen. **Conflict: The nurse as therapist and researcher.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Jul), Vol. 6(4), 202-207.—Examined the problems and conflicts of a psychiatric nurse during operant conditioning therapy of an 8-yr-old nonverbal psychotic boy in which the nurse was required to be therapist and at the same time participated in a research study with the patient that required relationship therapy techniques. (19 ref.)—M. Daniels.

6434. Petrovich, Donald V., Bennet, John R., & Jackson, Jean. (Veterans Administration Hosp., St. Louis, Mo.) **Nursing apparel and psychiatric patients: A comparison of uniforms and street clothes.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Nov), Vol. 6(6), 344-348.—Used a survey to assess patients' and nurses' attitudes after a 13-wk trial period in which nursing personnel wore street clothes rather than uniforms. Results obtained from 50 psychiatric patients and 15 nurses indicate a preference for street clothes as more conducive to providing patients with behaviorally therapeutic treatment, a result commensurate with milieu and community therapy programs in their emphasis on people as people, with greater approximation in treatment to the realities of social existence. It is concluded that the clothing worn by personnel is a significant variable in the treatment of Ss with behavioral disturbances. The wearing of street clothes by nurses in their treatment interactions with psychiatric patients is encouraged.—*Journal summary.*

6435. Pettifor, Jean L. & Pettifor, R. E. (Alberta Guidance Clinic, Calgary, Canada) **Is graduate training opting out?** *Western Psychologist*, 1970(May), Vol. 1(3), 97-99.—Discusses P. O. Davidson's (see PA, Vol. 44:21060) analysis of graduate training in clinical psychology in Canada, which emphasizes breadth of training at the possible expense of developing practitioner skills. Differences in emphasis between university training departments and service settings (e.g., hospitals

and clinics) are stressed. It is concluded that closer collaboration between these 2 groups is needed to meet mental health manpower needs more effectively.—*P. McMillan.*

6436. Quirk, Mary A. (City of Houston Health Dept., Tex.) **Occupational therapy demonstration for nursing students.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Sep), Vol. 6(5), 284-286.—Presented and evaluated a method of teaching nursing students about psychiatric occupational therapy in which students are placed in the role of patients and very poor therapy is administered to them. It is concluded that "by experiencing this anxiety-producing situation, the students become more cognizant of object relationships, group and individual behavior and how it affects others, and nonverbal communication."—*M. Daniels.*

6437. Ryback, David. (U. Hawaii) **The student nurse.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Jul), Vol. 6(4), 219-223.—Reviews studies concerning the values, interests, and personality characteristics of student nurses and the relationship between these factors and academic success. (34 ref.)—*M. Daniels.*

6438. Sata, Lindbergh S. & Shennig, Mary. (U. Maryland, Medical School) **Administrative implications of small group experiences.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Sep), Vol. 6(5), 261-266.—Initiated an 8-mo project to determine the efficacy of a didactic training group among 11 nurses in a psychiatric ward as a way of dealing directly with the high turnover rates among nurses. It is concluded that such small group experiences affect morale in a positive manner and that decreased turnover rates result.—*Journal summary.*

6439. Weinshel, Edward M., et al. **The changing identity of the psychiatrist in private practice: A symposium.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1577-1587.—Presented are brief comments, in essay form, upon the subject of the changing identity of the psychiatrist in private practice by each of the authors: E. M. Weinshel, L. C. Patterson, I. Philips, L. H. Schwartz, and D. A. Schwartz. Aspects, i.e., the desire to learn, the patient and society, the present role of the psychiatrist, training the psychiatrist, changes in private practice and the future of private practice, are discussed.—*P. R. Shibelski.*

PSYCHOTHERAPY & ANALYSIS

6440. Alpert, Murray. (New York U., Medical School) **Television tape for evaluation of treatment response.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 467-469.—Discusses the use of television recordings of patient interviews as a means of correcting a major source of biasing in double-blind studies. These studies have revealed that side effects rather than therapeutic effects have often served as cues in the rating process of treatment outcome. An illustrative example of such ratings is included. Videotape methodology permits comparison of pre- and posttreatment conditions within minutes and is not subject to the distortions of memory. Recordings can be useful in improving standardization of the rating process and in the teaching of psychopathology. They are also easily stored and transported.—*P. McMillan.*

6441. Aramoni, Aniceto. **Nuevo psicoanálisis?** [New psychoanalysis?] *Revista de Psicoanálisis, Psiquiatría y*

Psicología, 1970(Jan), No. 14, 34-39.—Discusses the problem of traditional psychoanalytic methods and theory becoming obsolete in the face of social and cultural changes. The relevance of applying subconscious pathogenic material from Freud's era to modern youth is questioned. It is noted that youth's attitudes toward sex, authority, conventionalism, and established values have changed. It is suggested that psychoanalysis, if it is to continue being a science of man, must remain flexible to social, economic, political, and historical change, as well as to the psychological and biological aspects of human nature, and strive to comprehend this dynamic interrelation in human existence.—*P. Hertzberg.*

6442. Avenburg, Ricardo. **La regresión en el proceso analítico en la obra de Freud.** [Regression in the analytic process in the work of Freud.] *Revista de Psicoanálisis*, 1969, Vol. 26(3), 669-677.—Examines the progression of concepts in Freud's works which lead to the development of his views on regression in analysis. It is noted that when Freud abandoned regression as a therapeutic artifice, it emerged spontaneously in transference. After the discovery of transference, Freudian concepts of regression in sleep, dream interpretations, the conflict between repression and the repressed, and the conflict between memory and repetition are discussed. (32 ref.)—*P. Hertzberg.*

6443. Banerji, Saradindu. **A case of anxiety about blindness.** *Samiksa*, 1968, Vol. 22(1), 23-32.—Describes the case of a 32-yr-old unmarried male civil servant treated for acute anxiety alternating with depression. During analysis it was pointed out to the patient that, among other things, (a) he was worried about his own blindness, rather than that of others; (b) the thought of blindness came to him as a form of punishment; and (c) in all his worries he was concerned about some loss to his ego. Interpretation of the case ascribed the main symptoms to 2 unconscious factors: The S's tendency of observing the sex organs of both elderly males and females, a voyeuristic tendency due to homosexual and oedipal interest. And the patient's oedipal desire, associated with guilt feelings, led to the necessity of punishment which took the form of blinding (symbolizing castration). The eye as a symbol of the penis is discussed with respect to the oedipus myth and Indian mythology.—*T. N. Webster.*

6444. Barros Santos, Oswaldo de. **Teorias e técnicas de Carl Rogers.** [Theories and techniques used by Carl Rogers.] *Revista de Psicologia Normal e Patológica*, 1968(Jul), Vol. 14(3-4), 170-185.—Presents a brief biographical sketch of C. Rogers, and reviews his major theories (i.e., client-centered therapy). The dynamics of the therapeutic process and the personality as described by Rogers and the significance and applicability of Rogerian techniques for current psychotherapy are discussed. Personal experiences with the use of Rogerian techniques are described.—*B. A. Stanton.*

6445. Bennett, Douglas. (Maudsley Hosp., London, England) **The value of work in psychiatric rehabilitation.** *Social Psychiatry*, 1970(Oct), Vol. 5(4), 224-230.—Discusses work as a beneficial treatment in the rehabilitation and care of psychiatric patients. Work can provide the psychiatrically ill with an opportunity for socially productive behavior. It fosters social interaction and, by recognizing a sick person's capacities, reduces the sense of social incompetence which he may experience as a patient. It helps him to structure his time

usefully. By developing skills it prevents the development of secondary disabilities and prepares him to return to an acceptable position in society. In a discussion of work, E. Jaques has said that it gives to man "a continuous account of the correspondence between outside reality and the inner perception of that reality, as well as an account of the accuracy of his appraisal of himself . . . In a very deep sense, it gives him a measure of his sanity." (French & German abstracts) (23 ref.).—*Journal abstract*.

6446. Berger, Milton M. (Columbia U., Coll. of Physicians & Surgeons) **Integrating video into private psychiatric practice.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 78-85.—Explores the value of videotape playbacks. Regardless of one's theoretical view of personality dynamics, use of video is seen as valuable for both patients and therapists. The importance of confidentiality, the type of "hardware" needed, and the manner in which the material is presented to the patient(s) is discussed. Except for severely depressed, suicidal patients whose self-hate centers around some physical characteristic, it is predicted that within 5 yr., 25% of private practitioners will make use of videotape playback.—S. R. Greenwald.

6447. Brodsky, Carroll M. (U. California, Medical School, San Francisco) **The systemic incompatibility of medical practice and psychotherapy.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 597-604.—Discusses problems encountered when a physician (who is not a psychiatrist) undertakes psychotherapy with his patients. Part of the data used was collected over an 8-yr period from a course in psychotherapy given to general practitioners and other specialists. Reasons for referral to a psychiatrist were derived from discussions with patients and physicians and include: (a) increase in symptoms, (b) difficulties in communication, (c) intense transference and countertransference, (d) the threat of suicide, (e) increased use of alcohol or drugs, (f) social discomfort (moving in the same social circles), (g) problems of allocating adequate time, and (h) the threat to the physician-therapist of changes in the patient produced by therapy. It is concluded that "psychotherapy is not natural to other medical systems" and if undertaken in such a context will "suffer a foreign body reaction and be rejected." (16 ref.).—P. McMillan.

6448. Castelnovo-Tedesco, Pietro. (U. California, Medical School, Los Angeles) **The "20-minute hour" revisited: A follow-up.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 108-122.—Sent a questionnaire dealing with the use of psychotherapy by nonpsychiatrists to 50 internists who, during their residency, took part in a psychotherapy course for medical residents. It was found that the majority of patients with emotional difficulties are treated by the physician himself and only a few are referred to psychiatrists. Most such patients are treated with drugs and reassurance, or drugs and brief psychotherapy. The "20-minute hour" is regarded as a useful approach to brief psychotherapy. 76% of the physicians believed that psychotherapy is an effective form of treatment, favor brief treatment emphasizing activity, and would be interested in further postgraduate training.—D. Prager.

6449. Christoffers, Carol A. **Movigenic intervention: An expanded dimension.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Nov), Vol. 6(6), 349-351, 354-360.—Discussed the importance of body language as communication, citing specific patient behaviors as

illustrations. Psychiatric health workers need to become physically literate, i.e., to develop an understanding and appreciation of the part played by body language in human relationships. It is proposed that some of the techniques used in dance education could be employed to accomplish this purpose. Some suggested exercises are presented. It is concluded that psychiatric health workers and patients should be encouraged to explore and experiment in the widest range of communication.—*Journal summary*.

6450. Davidson, P. O. & Schrag, A. R. (U. Calgary, Alberta, Canada) **Factors affecting the outcome of child psychiatric consultations.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 774-778.—A follow-up study of 780 children seen for psychiatric consultation established several variables as significant determinants of whether the recommendations made during the consultations would or would not be carried out. Many of these factors can be manipulated by the psychiatrist to ensure that his consultations are more effective.—*Journal abstract*.

6451. Gedo, John E. (U. Illinois, Medical Coll.) **The psychoanalyst and the literary hero: An interpretation.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 174-181.—The psychoanalyst's recurrent fascination with the literary hero implies that this is 1 aspect of his ongoing self-analysis. As long as insights are achieved only in terms of an externalized self-representation, such efforts remain at best partially successful. If conscious self-recognition occurs, however, the intermediary step of projection will have served as a facilitating function similar to that of the transference resistance in analysis. (18 ref.).—D. Prager.

6452. Haley, Jay. (Philadelphia Child Guidance Clinic, Philadelphia, Pa.) **The art of being a failure as a therapist.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 691-695.—Presents 12 steps, through which a psychotherapist can fail in the treatment of a patient. These steps are interpreted as restraining the patient who might spontaneously improve.—A. M. Berg.

6453. Havens, Joseph. (U. Massachusetts) **London? To study psychotherapy?** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 53-56.—The author describes his work experiences at Tavistock Clinic in London, especially in the areas of group and marriage therapy. After exploring London's East End, he affirms his belief that the therapist needs to participate with patients in their attempts to change the community.—S. R. Greenwald.

6454. Heap, Robert F., Boblitt, William E., Moore, Charles H., & Hord, James E. (Central State Psychiatric Hosp., Nashville, Tenn.) **Behaviour-milieu therapy with chronic neuropsychiatric patients.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 349-354.—Attempted to shape complex socially oriented behaviors in a group of chronic neuropsychiatric patients. A behavior-milieu therapy ward was formed in conjunction with a chronic ward which served as a control. The goal of the treatment program was to restore the patients to their communities. The treatment program consisted of a combination of behavior therapy, token economy, attitude therapy, and ward government. A total of 478 patients passed through the treatment program over a period of 35 mo. 68% of the Ss were returned to their communities with a relapse rate of 14%. Aside from the positive effects of the treatment program, many unprogrammed behavioral influences were observed

to have a direct effect upon the staff's and Ss' performance.—*Journal abstract.*

6455. Knobel, Mauricio. **Psicoterapia breve en la infancia.** [Brief childhood psychotherapy.] *Revista de Psiquiatría y Psicología Médica*, 1969(Apr), Vol. 9(2), 74-84.—Within the context of "brief psychotherapy" defined as "a therapy of limited time and objectives, involving a certain type of phenomena and determined methods of treatment which will allow for a better adjustment of the child to reality," it is proposed that: (a) the therapist be experienced, be able to establish a rapid rapport with his patient, and focus upon the important area of conflict (focal psychotherapy); (b) along with the techniques used in brief child psychotherapy, e.g., play, stories, drama, the theory of apprenticeship should continue to be implemented; and (c) in addition to group therapy and teamwork with the child, psychotherapy with the parents has also proven effective. Various problems particular to brief psychotherapy in children are analyzed. These include a firm knowledge of normal evolutive and pathological psychology of which age is a variable, and the parent-therapist relationship. Of the differences between brief psychotherapy and psychoanalytic therapy, the following points are discussed: (a) regression, (b) transference neurosis, (c) elaboration, and (d) objectal mutation. It is suggested that case histories (e.g., those involving family diseases, deaths, and divorces) and the various psychiatric problems of childhood be studied. It is concluded that brief psychotherapy has been very successful with children. (19 ref.)—S. Maze.

6456. Leitenberg, Harold, et al. (U. Vermont) **Practice as a psychotherapeutic variable: An experimental analysis within single cases.** *Journal of Psychiatric Research*, 1970(Feb), Vol. 7(3), 215-225.—An individual case method of experimentation was used to investigate the possible psychotherapeutic effects of a single environmental variable. The opportunity to practice nonphobic behavior in a gradual manner was introduced, withdrawn, and reintroduced in sequence, while amount of therapist attention and instruction designed to create expectancies for change were kept constant. Patients only showed positive change in a specific behavioral measure during practice phases; when practice was removed, performance either regressed or stayed the same. When practice was reinstated, phobic avoidance behavior began to decline again. (20 ref.)—R. V. Hamilton.

6457. Mendel, Werner M. (U. Southern California, Medical School) **Tandem treatment.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 110-113.—Proposes an administrative procedure which makes use of a 2nd therapist when the primary therapist feels overstressed in his own life. This procedure is especially designed for very sick, needy patients, and is initiated as soon as this evaluation has been made. The patient is scheduled for several visits with the secondary therapist near the beginning of treatment in order to establish a relationship which can be revived as needed. Requirements for using tandem treatment are that the 2 therapists like and respect each other, agree on basic goals of therapy, and that the patient must like both therapists.—S. R. Greenwald.

6458. Moss, C. Scott & James, Pauline. (U. Illinois) **"Black rover, come over!": The hypnosymbolic treatment of a phobia.** Urbana, Ill.: U. Illinois Press, 1970. x, 140 p. \$3.95(paper).

6459. Paz, Carlos A. **Reflexiones técnicas sobre el proceso analítico en los psicóticos fronterizos.** [Technical reflections on the analytic process in borderline psychotics.] *Revista de Psicoanálisis*, 1969, Vol. 26(3), 571-608.—Discusses theoretical bases and technical instrumentation which promote a progressive analytic process on the treatment of borderline psychotics who are capable of undergoing analysis. Based on the theory and technique of M. Klein, contributions from the Argentinian school are also considered for their therapeutic value. Certain basic elements were derived: (a) a technique for the interpretation and elaboration of psychotic anxieties in the regressive levels particular to borderline Ss; (b) the recognition of the existence of disrupted ego functions which may be recuperated through profound analysis; (c) the existence, in borderline Ss, of good inner aims which enable them to be potentially curable; (d) the benefit of the systematic interpretation of transference, even negative transference, as soon as it appears; and (e) the importance of the systematic use of countertransference on the regressive tendencies in borderline Ss. The difficulties presented by borderline Ss in various technical aspects of their therapy are considered and illustrated by clinical experiences with 2 male Ss. (English & French summaries) (51 ref.)—P. Hertzberg.

6460. Reynolds, David K. (U. California, Los Angeles) **Directed behavior change: Japanese psychotherapy in a private mental hospital.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 492.

6461. Ross, W. Donald. (U. Cincinnati) **The unmasking of diabetes mellitus by psychoanalysis.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 182-184.—Reports 2 cases in which psychoanalysis was accompanied by or followed by the appearance of diabetes mellitus. When this complication appears, a modified psychotherapeutic approach is indicated. (26 ref.)—D. Prager.

6462. Ruiz, Ogara C. **Principios fundamentales en la psicoterapia breve de orientación dinámica.** [Fundamental principles in brief dynamic psychotherapy.] *Revista de Psiquiatría y Psicología Médica*, 1969(Apr), Vol. 9(2), 97-106.—Discusses various aspects in the field of brief psychotherapy: (a) the existing confusion, (b) the various definitions, (c) its objectives (including the questioning of all concepts of normality and cure), (d) therapeutic factors (e.g., insight), (e) the ideas underlying the author's concept of brief dynamic psychotherapy, and (f) the areas of therapeutic intervention. Sufficient knowledge and experience without overemphasis on technical norms, deep respect for the patient, and an understanding of the therapist's own personality and reactions toward the patient are discussed as areas of therapeutic intervention. It is argued that: (a) brief psychodynamic therapy is a vague term used to designate various methods that follow limited therapeutic objectives and involve less time and depth of treatment than traditional psychoanalysis; (b) this treatment implies shorter and more flexible techniques that are planned according to the patient's needs; (c) the therapist must be experienced and must detach himself from prior judgments; and (d) due to the insufficient knowledge of those factors intervening in psychotherapy, other criteria (e.g., objectivity, verification, and precision) must be used so that psychotherapy can become an empirical science.—S. Maze.

6463. Schwartz, Barry J. (Woman's Medical Coll.,

Philadelphia, Pa.) **Psychiatric judo. Voices: The Art & Science of Psychotherapy**, 1969-1970(Win), Vol. 5(4), 73-76.—The art of therapy is likened to the art of judo in that instead of countering a patient's moves, the therapist will "seize hold of them, propelling them and exaggerating their energy." In so doing, the therapist must feel he can succeed even though to succeed, he must first learn to lose. This is seen as especially effective with masochistic patients, though the therapist must be careful not to let his concentration on skill occupy the whole substance of the relationship. Comments by T. W. Leland reinforce the author's position which is similar to J. Haley's method of taking charge of the patient's symptoms and gaining control.—S. R. Greenwald.

6464. Shore, Milton F. & Massimo, Joseph L. (National Inst. of Mental Health, Clinical Research & Program Evaluation Section, Adelphi, Md.) **Five years later: A followup study of comprehensive vocationally oriented psychotherapy. American Journal of Orthopsychiatry**, 1969(Oct), Vol. 39(5), 769-773.—Presents a follow-up study of 4 adolescent delinquent boys successfully treated in an experimental program 5 yr. ago. Few legal difficulties, stable employment, and personal growth were shown in those treated. However, 3 of the untreated youth were in adult correctional institutions, employment was irregular, personal rewards few. Contact with usual rehabilitative agents of society seemed unable to reverse the deterioration in the untreated group.—Journal abstract.

6465. Smolensky de Dellarossa, Giuliana. **Reanálisis. [Reanalysis.] Revista de Psicoanálisis**, 1969, Vol. 26(3), 545-569.—Discusses (a) taboos associated with reanalysis; (b) termination of the 1st analysis and ensuing technical implications; (c) reanalysis with a different analyst, including the 1st interview and the normalities and pathologies of treatment dynamics; (d) reanalysis with the same analyst using the same technique as before, illustrated by a clinical example; and (e) the metapsychological aspects of reanalysis. Investigation is centered on finding the moment of therapeutic change and its manifestations in the different psychic levels of the patients, as well as the attitudes of the therapist confronted with a patient who has been previously treated by 1 or more psychoanalytic method. (17 ref.)—P. Hertzberg.

6466. Sorrells, James. (U. California, Berkeley) **Sharing the supervisory tape in training and therapy. Voices: The Art & Science of Psychotherapy**, 1969-1970(Win), Vol. 5(4), 61-62.—A family in treatment was presented with an audio tape that contained not only the dialogue from their treatment session, but also supervisory remarks which were superimposed on the recording. The stated benefits from this technique are: (a) the family gets feedback from Os with a small investment in the outcome; (b) the students learn that greater emotional expression may be appropriate; (c) the family may learn that critical feedback can be constructive; and (d) the family is enabled to assume greater responsibility as they learn their therapist is in the process of growing and learning.—S. R. Greenwald.

6467. Taylor, Graham C. (McGill U., Montreal, Quebec, Canada) **The essentials of psychosynthesis. Psychosynthesis Research Foundation**, 1968, No. 22, 1-13.—Presents a brief summary of psychosynthesis, defined as a "frame of reference which includes the biological, the psychological... spiritual, philosophical and ethical realms and hence, strives to be compre-

hensive and inclusive without being eclectic." Locations of institutes of psychosynthesis now in operation are included. Psychosynthesis draws upon psychoanalytic, existential, and humanistic psychology, and Eastern philosophy. It employs such methods of therapy as "symbolic visualization and development of latent functions." The key concept is "the unifying, integrating center or self as a center of awareness and will." Psychosynthesis is a method of treatment for psychiatric disturbances, and "psychological development and self-realization for normal people who wish to grow beyond the level of more freedom from symptoms."—P. McMillan.

6468. Tomim, B. & Glenn, A. G. (Brooklyn State Hosp., N.Y.) **Psychotherapy with drug abusers in a male admitting service. Psychiatric Quarterly Supplement**, 1968, Vol. 42(1), 144-155.—Describes the combination of individual and group therapy with drug abusers and the various techniques and approaches in a state hospital setting. Also, the goals and results of treatment are presented. It is suggested that the program could be more effective if this group of patients were treated separately in a special unit with multidisciplinary staff. The community resources and agencies are key factors in reintegrating these patients in their community.—Journal summary.

6469. Weiss, Steven L. (U. Oklahoma) **Perceived effectiveness of therapy as a function of professional identification. Dissertation Abstracts International**, 1970(Aug), Vol. 31(2-B), 921.

6470. Zaborowski, Zbigniew. **Próba zastosowania koncepcji wyrównania postaw do zjawisk psychopatologicznych.** [An attempt to apply the conception of equalization of attitudes to psychopathological phenomena.] *Studia Socjologiczne*, 1970, Vol. 2(37), 187-213.—Examines the role of attitudes in ambivalent and neurotic interpersonal relations. Maladapted interpersonal behavior can be modified by a therapeutic process whose goal is to generate a positive attitude toward the therapist. This tactic forces a shift in the client's frame of reference thereby altering his interpersonal life style. (22 ref.)—H. Kaczkowski.

Therapeutic Process

6471. Berlin, Roger. **The team approach in hospital treatment as a defense of the psychiatrist. Comprehensive Psychiatry**, 1970(Mar), Vol. 11(2), 147-158.—Traces the "history of the team approach and touches on its contemporary aspects." Then it is suggested that passive defenses and feminine identifications may lead a psychiatrist to relinquish his responsibility to a team. The psychiatrist divesting himself of executive power reminds some patients of actually experienced parental neglect or role reversal, engenders painful affects, and exposes patients to values of individual team members which may not best suit their own personalities. It is suggested that the psychiatrist's personality in relation to the team approach needs reevaluation. (20 ref.)—D. Prager.

6472. Blumberg, Richard W. (U. Florida) **Client dogmatism, therapist leadership and the psychotherapeutic relationship. Dissertation Abstracts International**, 1970(Jul), Vol. 31(1-B), 389.

6473. Carr, John E. (U. Washington, Medical School) **Differentiation similarity of patient and therapist and the outcome of psychotherapy. Journal of Abnormal**

Psychology, 1970(Dec), Vol. 76(3, Pt. 1), 361-369.

—Supported the hypothesis that differentiation compatibility of patient and therapist is essential to improved outcome as perceived by the patient and as evidenced by his reported symptom reduction. Therapists were 4th-yr medical students; patients were 16 male and 8 female adult out-patients with predominately neurotic diagnoses. In an initial phase of therapy, incompatible patients and therapists "seek" compatibility as a basis for establishing productive communication. Following the establishment of compatibility, therapists' differentiation levels increase, presumably reflecting their efforts to further articulate the patient's relevant conceptual dimensions. Patients' level relates to number of symptom complaints, and it is hypothesized that differentiation (and thus symptom) change in the presence of cognitive compatibility is perceived as therapeutically derived improvement. The importance of role identities is considered in relation to the perception of outcome and the assumption of vantage points. (24 ref.)—*Journal abstract*.

6474. Gustin, Ann W. (Syracuse U.) **Biased therapists: The effects of prior exposure to case history material on therapists' attitudes and behavior toward patients.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 394.

6475. Marshall, John R. (Randolph Air Force Base, 3510th Hosp., Tex.) **Treatment problems of a military psychiatrist with patients of higher rank.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 190-195.—Describes several difficult countertransference situations, and discusses possible errors. These errors may result initially from role conflicts but basically arise from transference feelings and their effects. Recognition is essential to their management and suggestions to this end are offered. 4 case histories are presented.—*Journal summary*.

6476. Reisman, John M. (Memphis State U.) **Ratings of self and therapist: Two studies.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 116-123.—The 1st study measured changes in a 14-yr-old boy's concepts of the therapist and himself over a 50-session course of psychotherapy. S's ratings became more positive of himself and less positive of his therapist, so that by the conclusion of therapy, the ratings were similar, positive, and relatively stable. It is hypothesized that clients willing to be involved in therapy at 1st rate themselves lower than the therapist, while clients who are resistant to treatment initially rate themselves as high as or higher than the therapist. In the 2nd study this hypothesis was tested by asking 55 Ss to rate themselves and a psychotherapist, and to indicate their willingness to be seen in therapy. Results support the hypothesis.—D. Prager.

6477. Trousdale, Jean B. (U. Oklahoma) **The demand characteristics of psychotherapy.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 921.

6478. Waters, Carrie W. & Pullen, Maxwell. (Ohio U., Center for Psychological Services) **Effect of the sudden departure and replacement of one member of a co-therapy team on a married couples group.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 65-74.—Examines the effect of a change of therapists on a group. The presence of the remaining therapist made it easier for members to handle their intense feelings of anger and desertion toward the departed therapist. The increase in anxiety and hostility heightened group

interaction. Results indicate that when there are cotherapists, the departure (and replacement) of 1 may bring positive results.—*Journal summary*.

6479. Winnicott, D. W. (87 Chester Square, London, England) **Aspectos clínicos y metapsicológicos de la regresión dentro del marco psicoanalítico.** [Clinical and metapsychological aspects of regression in the psychoanalytic framework.] *Revista de Psicoanálisis*, 1969, Vol. 26(3), 693-716.—Discusses the differences in technique that are necessary for achieving therapeutic success with 3 different types of patients: (a) those with difficulties in daily interpersonal relations, but with a satisfactory development in former infantile stages; (b) those who require analysis with a depressive position, and are characterized by a pathological mother-child relationship; and (c) those with primitive emotional development where the mother's management of the child is a necessity. Discussions of what may be expected in clinical encounters with the regressive patient follow.—P. Hertzberg.

Group Therapy

6480. Bailey, Kent G. (Virginia Commonwealth U.) **Audiotape self-confrontation in group psychotherapy.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 439-444.—Tested the usefulness of audiotape playback during psychotherapy. 24 inmates at a federal women's prison were randomly divided into an audiotape-playback group, a regular therapy group, and a non-therapy control group. All Ss were administered a special Q-sort test immediately before and following a 6-wk therapy or control period. The groups did not significantly differ on any of the 3 Q-sort indices used. Taped excerpts from the 2 experimental groups showed that the playback Ss were significantly more verbally productive/unit of time, and it is suggested that playback may have affected the process but not the outcome of psychotherapy. (19 ref.)—*Journal abstract*.

6481. Borofsky, Ruth B. (Boston U., School of Education) **Learning from group experience: An analysis of the experiential structure of therapeutic dialogue.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 389.

6482. Clement, Paul W., Fazzone, Roger A., & Goldstein, Bertram. (Fuller Graduate School of Psychology, Pasadena, Calif.) **Tangible reinforcers and child group therapy.** *Journal of the American Academy of Child Psychiatry*, 1970(Jul), Vol. 9(3), 409-427.—16 2nd and 3rd grade boys were randomly assigned to 2 therapy and 2 control groups, 4 Ss each. Ss had been referred to the clinic by their teachers because of shy, withdrawn behavior. The "token" group met in a play group, had a therapist, and received tangible reinforcements for social approach behaviors. The "verbal" group was treated similarly to the token group except that no tangible reinforcements were used. Control Group A met in a play group without a therapist present. The Ss in Control Group B were placed individually in separate play rooms with no therapist present. Each group came to the clinic for 20 consecutive 1-hr sessions, 1 session/wk. The token group changed more than the verbal group; the verbal group changed more than Control Group A; Control Group A changed more than Control Group B; and Control Group B showed no changes on the objective measures used. A 1-yr,

posttherapy follow-up was performed. Data were combined with those from a 2-yr follow-up on children from an earlier study. The token group Ss continued to be better adjusted than the verbal and control group Ss; however, there were no reliable differences between the verbal and control groups. (31 ref.)—*Journal summary*.

6483. Derbolowsky, Udo. **La técnica tridimensional de la interpretación de los sueños en el proceso psicoanalítico.** [The tridimensional technique of dream interpretation in the psychoanalytic process.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1970(Jan), No. 14, 23-33.—Discusses a technique which implies a renunciation of the associative technique in dream interpretation in group therapy. Patient-analyst dialogues are used to illustrate a process of reaching patients who resist elaborating their dreams. The 1st step is compelling the S to recall his dream in its original form. The 2nd level involves complementary inversion of the 1st process. After a transformation of the original form into its opposite, a manifestation of the conflict situation is sought. In the 3rd level of dream elaboration, an oneiric signal is revealed. This is characterized by a complete disinvolverment by the S as a member of the group. Insight is gained and marked by joyful revelation. (34 ref.)—*P. Hertzberg*.

6484. Dworin, Jack. (Veterans Administration Mental Hygiene Clinic, Denver, Colo.) **The alternate session in group psychotherapy.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 105-107.—The alternate session is a regularly scheduled session of a psychotherapy group in which the therapist(s) is not present. Alternate sessions begin after the group members start to work things out on their own and are somewhat comfortable in expressing feelings. A lessening of dependency on the therapist, closer relationships among members, more freedom of expression, and a hastening of the psychotherapeutic process are considered to be some of the benefits of the alternate session.—*S. R. Greenwald*.

6485. Leeman, Gavin P. (Harvard Medical School, Boston, Mass.) **Dependency, anger, and denial in pregnant diabetic women: A group approach.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 1-12.—Attempted to provide psychological assistance with the emotional complications of diabetic pregnancy through a form of group psychotherapy met with overwhelming difficulties. These difficulties seemed to arise from a conflict between the patients' angry feelings and their feelings of dependency, a conflict they handled by massive psychological denial. Despite the obstacles, several Ss became better able to cope with their problems.—*Journal summary*.

6486. Mintz, Elizabeth E. (41 5th Ave., New York, N.Y.) **The marathon on wings.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 23-27.—The author shares an afternoon of a marathon therapy group, and describes the experiences of 3 participants. In so doing, she illustrates the movement away from self-absorption toward interest in others and the impact of symbolic encounters which are said to be part of the marathon process.—*S. R. Greenwald*.

6487. Ortega, Manuel S. **Estado actual del psicodrama.** [Present state of psychodrama.] *Revista de Psiquiatría y Psicología Médica*, 1969(Apr), Vol. 9(2), 107-121.—Analyzes the origins, methods, techniques, and personal experiences of psychodrama. The theory of spontaneity (including the "e factor" and "warming-

up"), and the theory of characters (roles) are discussed as part of the sources of psychodrama. The methods used are of a diagnostic (characterological-psychobiographic) or therapeutic (cathartic-educational) nature. The various theories of (a) the stage and its different types; (b) the protagonist; (c) the director-therapist and his positions as interviewer, O, and spectator; (d) the auxiliary egos and their triple function of actor, leader, and social analyst; and (e) the public are examined. The 15 techniques studied include those of Moreno (the inventor of psychodrama), and those derived from him. It is concluded that psychodrama functions (a) diagnostically and should be used in every type of neurosis (including borderline cases); (b) characterologically in that it becomes a "performance test"; (c) psychobiographically, whereby it provides precise information on S's problem; and (d) therapeutically, including the cathartic, educational, and didactic criteria. Observation and personal experience are stressed.—*S. Maze*.

6488. Payne, I. Reed; Rasmussen, Della M., & Shinedling, Martin. (Brigham Young U.) **Characteristics of obese university females who lose weight.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 567-570.—Compared 18 successful and 9 unsuccessful participants in group therapy for reducing weight, using responses to the EPPS scales. Only the Consistency scale differentiated between groups; however, the Nurturance and Succorance scales differentiated successful Ss from the normative population. Successful Ss felt more responsible on the goal check list, while unsuccessful Ss rated themselves on the check list as more self-satisfied and better able to establish meaningful relationships. Possible explanations are suggested. A cross-validation study confirmed that unsuccessful Ss scored higher on the Consistency scale of the EPPS. It is suggested that the Consistency scale of the EPPS may serve as an effective screening device in treatment programs for the obese university female. (19 ref.)—*Journal abstract*.

6489. Robertiello, Richard C. (Long Island Consultation Center, Forest Hills, N.Y.) **Encounter techniques: Ridiculous or sublime?** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 89-90.—The author shares his experience as a coleader in an encounter group. While some people experience nonverbal encounter techniques as permission to be free and to express feelings, others experience them as specific demands to produce feelings. Accordingly, only certain patients will respond to this form of treatment.—*S. R. Greenwald*.

6490. Sadoff, Robert L., Resnik, H. L., & Peters, Joseph J. (Temple U.) **On changing group therapists.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 156-166.—Discusses the dynamics of the change of therapists for a character-disordered pedophile group, utilizing analytically-based observations, interpretation of dreams, and behavior distortions. The conflicts of the therapists were resolved in part by intellectual defenses—the substitution of a writing team for the therapy group. The change in rank on the paper-writing team reflects this resolution. Unresolved feelings between and among a new therapist, the coterapist, and administrative team, are clearly reflected in the dynamics of the therapy group.—*Journal summary*.

6491. Wile, Daniel B., Bron, Gary D., & Pollack, Herbert B. (California State Coll., Hayward) **The Group Therapy Questionnaire: An instrument for study of leadership in small groups.** *Psychological Reports*,

1970(Aug), Vol. 27(1), 263-273.—Presents the Group Therapy Questionnaire (GTQ), which describes 20 realistic situations which may occur in the course of group therapy and asks each S to indicate how he might respond if he were the group leader confronted with such a situation. The format of this instrument constitutes an attempt to deal with the classical incompatibility between clinical meaningfulness and scientific measurability. The particular leadership variables explored by the GTQ were selected primarily because they seemed to involve fundamental decisions concerning leadership in small groups. 4 general situations are described in which the GTQ has potential usefulness: (a) as a criterion for evaluating the effectiveness of training courses in group therapy, (b) as a criterion measure for comparing different types of leaders, (c) as an independent variable in outcome studies, and (d) as a teaching device. (36 ref.)—*Journal abstract*.

6492. Wollersheim, Janet P. (U. Missouri) **Effectiveness of group therapy based upon learning principles in the treatment of overweight women.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 462-474.—Following an 18-wk base-line period, 79 motivated overweight female students were randomly assigned from stratified blocks, on percentage overweight, to 1 of 4 experimental conditions: (a) positive expectation—social pressure; (b) nonspecific therapy; (c) focal therapy based upon major learning principles; or (d) no-treatment—wait—control. 2 male and 2 female therapists each treated 1 group of 5 Ss in each of the 3 treatment conditions for 10 sessions extending over a 12-wk period. At both posttreatment and the 8-wk follow-up, the focal group was superior in weight reduction and reduction of reported frequencies of various eating behaviors. Evidence for "symptom substitution" was lacking. While significant differential weight reduction occurred for the various treatments, it did not occur for the different therapists or for the various therapist-treatment combinations. (31 ref.)—*Journal abstract*.

Behavior & Conditioning Therapy

6493. Friedman, Philip H. (Eastern Pennsylvania Psychiatric Inst., Philadelphia) **Limitations in the conceptualizations of behavior therapists: Toward a cognitive-behavioral model of behavior therapy.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 175-178.—Proposes a cognitive-behavioral approach to behavior therapy as an alternative to the counter-conditioning model presently in vogue. The key terms in this model are cognitive appraisal, threat, counterharm resources, behavioral coping action tendencies, situational constraints, internalized values and affects. The approach based on R. Lazarus' theorizing is briefly described, personalistic broad-spectrum behavior therapy techniques are classified according to this model, and an outline is presented to demonstrate the value of the cognitive-behavioral approach in conceptualizing the development and change of maladaptive behavior.—*Journal abstract*.

6494. Kraft, T. (Claybury Hosp., Woodford Bridge, England) **A note on aversion therapy.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 165-166.—Aversion therapy may lead to suppression of undesired behavior without altering the underlying disturbances which originally led to the behavior. Desensitizing the patient

to his underlying difficulties might be more helpful to the patient and lead to a more permanent recovery. (18 ref.)—*Journal abstract*.

6495. Ribes I, Emilio, et al. (Veracruzana U., Xalapa, Mexico) **El uso de castigo en la modificación de conducta de niños retardados.** [Use of punishment in the behavior modification of retarded children.] *Revista Latinoamericana de Psicología*, 1970, Vol. 2(2), 137-159.—Techniques of behavior modification by punishment were applied to 4 mentally retarded children. It is concluded that: (a) Punishment is highly effective in the elimination of undesired behaviors. (b) It does not seem to produce noxious side effects on the S. (c) Punishment by time-out and physico-social punishment imply less discriminative stimuli, in relation to their conditions of application, than electric shock. (d) Punishment should be applied in 2 types of situations: when the contingencies that maintain the behavior are intrinsic to its emission, and no control of reinforcers is available; and when the emission of responses incompatible with the reinforced behavior makes it impossible to put the S under direct immediate control of the positive contingencies of reinforcement.—*English abstract*.

6496. Suinn, Richard M. (Colorado State U.) **Desensibilización: Nuevos procedimientos.** [Desensitization: New procedures.] *Revista Latinoamericana de Psicología*, 1970, Vol. 2(2), 129-136.—Reviews some innovative modifications in technique and usage of behavior therapy with an emphasis on desensitization. The topics discussed are: (a) use of desensitization in group treatment, (b) use of audio or videotapes in place of a therapist for desensitization, (c) the new marathon desensitization group procedure, (d) the use of relaxation in a case of LSD intoxication, (e) the use of behavior therapy to treat a case of highway hypnosis, and (f) the treatment of clients without their awareness of being treated. (25 ref.)—*English abstract*.

6497. Tramontana, Joseph & Stimbirt, Vaughn E. (U. Tennessee, Child Development Center) **Some techniques of behavior modification with an autistic child.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 498.—Marked changes in the social behavior of a 7-yr-old autistic child occurred during 50 twice-weekly training sessions. An extensive repertoire of questions and answers was developed by fading imitative prompts. Written materials were also effective in teaching the answers to questions. A variety of techniques were used to increase generalization and appropriate "spontaneous" language.—*Author abstract*.

6498. Trejo, Benjamín D. **Modificación y análisis de la conducta en pacientes mentales.** [Behavior analysis and modification in mental patients.] *Revista Latinoamericana de Psicología*, 1970, Vol. 2(2), 123-128.—Presents an application of behavior analysis and modification of mental patients in psychiatric settings. Behavior therapy techniques are discussed, and their basic foundations are analyzed. A comparison is made with traditional psychoanalytic techniques and the results are found to be favorable to the behavior therapy approach.—*English abstract*.

6499. Ullmann, Leonard. (U. Illinois) **On behavior therapy.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 13-17.—Presents a capsule survey of the actions that distinguish behavior therapists. Behavior is said to be changeworthy because of its social consequences, not because it is "good" or "bad." Behaviorists, following an educational model, consider

diagnosis to be a designation of what should be changed and a selection of 1 or more procedures for making these changes likely. The author indicates what using this form of treatment with his patient has done for him.—S. R. Greenwald.

6500. Walker, C. Eugene, et al. **Behavior theory and therapy.** *California Mental Health Research Symposia*, 1968, No. 2, 50 p.

6501. Woody, Robert H. (U. Maryland) **British behavioural counselling.** *Educational Research*, 1968(Jun), Vol. 10(3), 207-212.—Reviews the literature supporting behavioral counseling techniques, and compares the responses of therapists of various counseling orientations to specific client comments. The directive techniques and reinforcement procedures of the behavioral counselor are emphasized. It is suggested that behavioral counseling is appropriate for use in the British setting for at least 3 reasons: (a) the conditioning procedures involved in such counseling have been used in other settings by British educational and clinical psychologists and psychiatrists; (b) behavioral counseling is not incompatible with the more traditional insight approaches, and the integration of the approaches has been found to give more successful results; and (c) behavioral counseling employs clearcut goals and techniques which are readily recognizable and should be advantageous in the early periods of counseling in Britain. (20 ref.)—R. Wiltz.

Special & Adjunctive Therapy

6502. Davis, Harry K. & Franklin, Roy W. (U. Texas, Medical Branch, Galveston) **"Continuing grief" as a method of psychotherapy following E.S.T.: A preliminary report.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 626-630.—Discusses a special psychotherapeutic technique called "continued grief" therapy which is particularly applicable to depressed patients who are inclined to relapse after initially successful ECS treatment. 5 case studies where this technique was used with success are presented. Interviews held 8-54 mo. after discharge with each patient indicated freedom from overt symptoms at that time. Continued grief therapy is described as modified psychotherapy which utilizes both supportive and psychoanalytically oriented techniques (including the concepts of "ambivalent love object loss" and "unresolved grief"). Tranquilizers and antidepressants were also used as needed in all cases. Schemata are included to illustrate the psychological processes occurring in this type of therapy. (17 ref.)—P. McMillan.

6503. Diephouse, John W. (19 Lorraine St., Hartford, Conn.) **Music therapy: A valuable adjunct to psychotherapy with children.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 75-85.—Reviews the history of the soothing effects of music since Biblical times, and discusses physiological effects of music therapy which has developed around physiology, socialization and communication, and motivation. By 1st communicating through music, it is possible to make a child more receptive to other forms of therapy. Music provides motivation for the child so that psychotherapy may be of maximal benefit. Music therapy allows a child to recognize his emotions, express them openly, and then bring them under control in a socially acceptable manner. (15 ref.)—D. Prager.

6504. Gebbie, Kristine M. (U. California, Los An-

geles) **Treatment drop-outs and the role of the crisis therapist.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Nov), Vol. 6(6), 328-333.—Examined 7 cases of patients leaving crisis intervention therapy before termination. Reasons for leaving included: inability of consultant to identify precipitating crises, financial difficulties of the patient leading to further helplessness, decision to seek treatment elsewhere, and achievement of stability before the end of treatment. Methods of preventing early withdrawal are suggested.—M. Daniels.

6505. Kamerschen, Karen S. (Michigan State U.) **Multiple therapy: Variables relating to co-therapist satisfaction.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 915.

6506. Piaget, Gerald W. & Serber, Michael. (555 Middlefield Rd., Mt. View, Calif.) **Multiple impact therapy.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 114-124.—Multiple impact therapy (MI) is a time-limited series of clinical encounters between several therapists and a single patient oriented toward a specific therapeutic goal. MI is an adjunct to individual therapy. Patient and therapists are briefed beforehand. Cooperation among therapists is vital. The MI group is limited and invariant; however, when handled properly, MI incorporates the best characteristics of individual and group psychotherapy. (17 ref.)—*Journal summary*.

6507. Tobin, Stephan A. (San Fernando Valley State Coll.) **Self-support, wholeness, and Gestalt therapy.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 5-12.—Considers a ubiquitous problem of our times to be the feeling of incompleteness which people experience, accompanied by their need to manipulate others into confirming them. This feeling of incompleteness is considered to be caused by the view that man is basically evil, by authoritarianism in major institutions, by emphasis on achievement in the future, by playing comparison games and blame games, and by the duplicity which can be found in interpersonal relationships. Self-esteem, which the author states is related to awareness of the here-and-now, is said not to be experienced by most Americans who spend their time daydreaming about the past or future. The phenomenology of wholeness and how it can be achieved in therapy is discussed.—S. R. Greenwald.

6508. Williams, Jack D., Dudley, Harold K., & Guinn, Terry J. (Rusk State Hosp., Tex.) **Use of day treatment center concepts with state hospital inpatients.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 748-752.—Examines the effect of the therapies and team approach used in day treatment centers (DTCs) as an adjunct for the treatment of chronic inpatients in traditional mental institutions. 204 inpatients with which the day treatment concepts were used performed significantly better on an objective measure of intelligence than did controls. Fisher's t test was used to compare posttest beta IQ scores for the experimental and control groups. Results indicate effectiveness of DTC increased personality integration reflected in the higher percentage of discharges and furloughs for the experimental group (54.8%) as compared to the control group (34.3%).—*Journal abstract*.

Drug Therapy

6509. Avakumov, V. M. & Vikhlyaev, Yu. I. **Metabolizm psikhotropnykh sredstv (proizvodnye**

fenotazina I iminodibenzila.) [Metabolism of psychotropic agents (derivatives of phenothiazine and iminodibenzyl).] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 444-452.—Presents a survey of the literature on the metabolism of psychotropic agents, whose structure is tricyclic (phenothiazine and iminodibenzyl derivatives). The (a) processes of conversion of psychotropic agents with tricyclic structure, (b) specific differences between phenothiazine and iminodibenzyl derivatives, (c) pharmacological properties of the metabolites, and (d) significance of several metabolites of imizine and aminazine (chlorpromazine) in the emergence of therapeutic and side effects are discussed. (90 ref.)—*J. D. London.*

6510. **Azcarate, Carlos A. Ensayo experimental con un nuevo antidepressivo (Tiazenona, SQ 10496): Estudio controlado con imipramina y placebo.** [Experimental essay with a new antidepressant (Thiazene, SQ 10496): Controlled study with imipramine and placebo.] *Revista de Neuro-Psiquiatria*, 1969(Sep), Vol. 32(3), 194-211.—Describes the evaluation of a new antidepressant, thiazene (T), using 60 18-56 yr. old psychoneurotic depressive outpatients. 20 received T in 50-mg tablets, 20 received placebo, and 20 received imipramine (I) (tofranil, an antidepressant) in 25-mg tablets. Over an 8-wk period, T dosage was increased to 800 mg/day and I dosage to 400 mg/day. 39 Ss completed 3 wk. of study and 27 completed 8 wk. Ss were evaluated by weekly interviews and by a Squibb Laboratories evaluation form. Significant improvements were found after 3 and 8 wk. for all treatment groups, with active medication groups showing the most favorable results. Most side effects, found only in the active medication groups, were of the autonomic type and were well tolerated. T produced only 1/3 as many side effects as I. The therapeutic effectiveness of T and I were found to be similar, although a slightly larger number of Ss benefited from I. However, T was recommended for Ss where side effects might present a problem. No correlations were found between sex, age, diagnosis, and therapeutic outcome. (48 ref.) (English, German, & French summaries)—*P. Hertzberg.*

6511. **Blanc, M., et al. (Centre Psychiatrique St. Anne, Paris, France) Etude comparative de l'activité de deux neuroleptiques.** [A comparative study of the activity of two neuroleptics.] *Encéphale*, 1970(Mar), Vol. 59(2), 97-161.—Compared the therapeutic activity of TPN 12 with that of thioridazine. The 2 drugs share an important therapeutic action even though they can be differentiated by degree of activity. Both drugs were found to be effective in chronic hallucinatory psychoses and delirious states. TPN 12 seemed to be more effective in manic states, and superior in cases of paranoia or paranoid schizophrenia or acute delirious excitation. It was not as successful in cases of chronic hallucination, hebephrenia, or paraphrenia.—*W. W. Meissner.*

6512. **Bruschi, Walter C. (Louisiana State Medical School, Shreveport) Psychopharmacology and general adaptation syndrome.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 513-516.—Discusses the relationship of certain psychoactive substances in the response of organisms to local or topical stress, and generalized or systemic stress. It has been noted that chlorpromazine inhibits the effects of topical stress. It is observed that when the organism is faced simultaneously with both topical and systemic stress, it will deal with the systemic stress at the expense of the topical insult. The impli-

cations of Bertalanffy's General System Theory, where living matter exists as "an open system, all parts teleologically in mutual interaction," are discussed. It is concluded that psychotropic agents provide a temporary benefit in that they are "able to induce both polarities in adaptation: active involvement and unconditional withdrawal."—*P. McMillan.*

6513. **Butler Blacker, Alberto. Ensayo terapeutico con el tiotixeno en desórdenes emocionales: Estudio controlado y empleo de nuevas formas de evaluación.** [Therapeutic essay with thiothixene in emotional disorders: Controlled study and use of new forms of evaluation.] *Revista de Neuro-Psiquiatria*, 1969(Jun), Vol. 32(2), 120-134.—Tested thiothixene (P-4657-B), a new neuroleptic with antipsychotic action on 33 male and 47 female ambulatory psychoneurotics with a mean age of 34.8 yr. 40 Ss received 3 1-mg tablets of thiothixene/day for 2 wk., after which the dosage was adjusted to individual needs for 2 more wk. 40 Ss received placebo. Psychiatric evaluations included symptomatic questionnaires completed by both doctors and Ss. 23 Ss on thiothixene and 26 Ss on placebo completed 4 wk. of study, while 11 Ss on the drug and 5 on placebo completed 2 wk. of study. The common side effects were (a) somnolence from both drug and placebo, (b) tremor and restlessness from thiothixene, and (c) dryness of mucus membranes from the placebo. There was a 96% improvement rate in the 49 Ss who completed the study, although there was no significant difference between the medication groups. Thiothixene, however, was found to be more effective in treating cases of mixed anxiety and depression. (English, French, & German summaries) (61 ref.)—*P. Hertzberg.*

6514. **Caffey, Eugene M. & Prine, Robert F. (Veterans Administration, Dept. of Medicine & Surgery, Washington, D.C.) The VA-NIMH study of lithium in affective disorders.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 409-412.—Provides an interim report of a 4-yr study on the "therapeutic and prophylactic efficacy of lithium carbonate in affective disorders." The study involved 12 Veterans Administration and 6 state and private hospitals. Approximately 295 patients who met careful diagnostic requirements of (a) manic, (b) schizoaffective, or (c) mixed were selected for a modified blind 3-wk treatment program of either chlorpromazine or lithium carbonate. Considerable dropout occurred (21, 28, and 17%, respectively) for the 3 groups. A full analysis of the efficacy of treatment is not yet available, although it is noted that "lithium has behaved as predicted" and, while toxic, can be adequately managed by clinicians who make accurate diagnoses, and alert to possible toxicity, and have reliable laboratory support. Preliminary results of prophylactic treatment of manic-depressive illness and a companion outpatient study are presented.—*P. McMillan.*

6515. **Cannarsa, D. N. (Pfizer Laboratories, New York, N.Y.) Drug combinations and interactions.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 526-529.—Discusses the history and efficacy of polypharmacy, "the simultaneous prescription of 2 or more drugs to a patient." The recent marked increase in the use of combination medication has given rise to questions concerning the nature of the interactions which may occur when drugs are given concurrently. The sequence of possible metabolic processes for a given drug involves the following considerations: (a) absorption from the intestinal tract is subject to various influences; (b) drug

distribution in plasma or tissues may be affected; (c) biotransformation of 1 drug may be influenced by another drug which either inhibits or stimulates its metabolism; and (d) drug excretion can be influenced by another agent's effect on the urinary pH. (17 ref.)—*P. McMillan*.

6516. Capstick, N. (Graylingwell Hosp., Chichester, England) **Long-acting drug treatment in overall psychiatric management.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 15-17.—Discusses side effects and related problems in relation to both oral and intramuscular administration of the long-acting phenothiazines. Results of a study of 56 patients being given intramuscular fluphenazine indicate that: (a) whenever phenothiazines are clinically indicated, injections of fluphenazine enanthate can be used as an alternate to oral administration; (b) side effects occur but can be controlled; and (c) drug administration is needed, on the average, only every 14 days. Suggestions for the management of outpatients on long-acting drugs are presented.—*P. McMillan*.

6517. Carbajal, Carlos L. & Jeri, F. Raul. **Intoxicación grave con tranilcipromina y trifluoperazina: Informe de tres casos.** [Severe intoxication with tranilcipromine and trifluoperazine: Report of 3 cases.] *Revista de Neuro-Psiquiatria*, 1969(Sep), Vol. 32(3), 180-193.—Describes 3 cases of intoxication by tranilcipromine (Tra) and trifluoperazine (Tri) (stelapar) in a 13-yr-old girl, a 22-yr-old man, and a 7-mo-old baby. The management of intoxication is considered very risky because Tra, of which Tri is a psycholeptic derivative, is the most powerful MAO inhibitor known, and particularly affects the cerebral and cardiovascular systems. In the 1st 2 Ss, poisoning was manifested by headache, fast pulse, high blood pressure, uncoordination, psychomotor excitation, and muscle spasms. The baby showed muscle contractions, oculogyric crises, tremor, opisthotonus, hyperthermia, and somnolence. Recommendations are made for treatment according to the symptoms manifested by an individual S. (45 ref.) (English, French, & German summaries)—*P. Hertzberg*.

6518. Chanas, Peter J. (A. H. Robins Co., Richmond, Va.) **Problems regarding the introduction of a psychopharmaceutical agent in international markets.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 530-531.—Discusses standards that must be met to introduce a new drug into the market outside the United States. Requirements to bring a new drug into use in the United States are reviewed, including the role of the Food and Drug Administration. The role of patent protection on new drugs is summarized. It is urged that such protection not be diminished, as has been proposed in some countries.—*P. McMillan*.

6519. da Costa Machado, Alberto. (General Polyclinic, Rio de Janeiro, Brazil) **Enurese infantil: Revisão e tratamento pela imipramina.** [Infantile enuresis: Revision of treatment with imipramine.] *O Hospital*, 1969(Mar), Vol. 75(3), 917-931.—Reviews incidence and etiology of infantile enuresis and reports personal experience with the use of imipramine (tofranil) in 50 outpatients with psychogenic enuresis. Psychological tests were administered and care was taken not to include organic enuresis cases, by taking X-rays of the lombo-sacra region (spina bifida) and urinalysis. The drug was efficient in 70% of the cases (20% of 13 cases optimal and 50% of the cases good). The dosage was 10-25 mg, according to the age. Tolerability was good,

with no side effects reported. The treatment was maintained for 60-90 days. (25 ref.)—*English summary*.

6520. Dasberg, H. & Robinson, S. (Talbieh Psychiatric Hosp., Jerusalem, Israel) **Correlation between electroencephalographic deviations following anti-psychotic drug treatment and the course of mental illness.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 185-200.—Observed and studied EEG deviations in 10 mental patients treated by phenothiazine derivatives. Findings simulate brain damage, intoxication of the CNS, or convulsive disorders. In some cases a previously existing brain damage was revealed and appeared aggravated. In the unfolding EEG, 3 types of changes became discernible tallying with a specific clinical course and with the results obtained by the antipsychotic drug treatment. Clinical phenomena presumably arising in the wake of psychotoxic effects of the drugs are discussed. (25 ref.)—*Journal abstract*.

6521. Dickel, Herman A. (U. Oregon, Medical School, Portland) **A survey of anti-anxiety agents used over the past 30 years.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 477-482.—Reports results of a survey of over 35,000 patients treated since 1939 in a psychiatric clinic where over 1/2 of the patients were suffering from anxiety-tension states. Illustrative graphs are provided showing trends during the 3 decades from 1939-1969 for factors, i.e., age and sex of patients, source of referral, place of treatment, relative number of physicians and psychiatrists in the area, percentage of patients receiving drugs, and typical medications used. 2 major impressions are gained: (a) antianxiety drugs have seldom produced fundamental change in the basic physiology of anxiety reactions; and (b) the final answers to the treatment of anxiety cannot be found solely in drug therapies. The importance of the physician as an antianxiety agent is stressed.—*P. McMillan*.

6522. Dykstra, P. (U. Groningen, Psychiatric Clinic, Netherlands) **Some methods for measuring changes in the behaviour of depressive patients.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Mar), Vol. 72(2), 219-224.—Presents a survey of different methods used to measure the effects of an antidepressive drug. The validation of a Q-sort constructed for the measurement of changes of depressive patients is discussed. Significant differences between the self-assessments of depressive Ss before and after treatment were found. The self-assessments of nondepressive Ss, however, shifted into the same direction.—*Journal summary*.

6523. Earle, Brian V. (12 1st Ave., Ilion, N.Y.) **Thyroid hormone and tricyclic antidepressants in resistant depressions.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1667-1669.—Outpatients who had become resistant to tricyclic antidepressants (N = 17) or who had responded inadequately (N = 8) were also administered 25 mcg. of sodium triiodothyronine daily. Psychotherapy was continued throughout. Excellent results were obtained in 14 cases. Ss showed improvement on the average within 5 1/2 days. 4 out of 8 cases relapsed after 5-8 mo., although they subsequently responded to MAO inhibitors. It is not certain whether this good response was related to previous treatment or not, but systemic side effects were insignificant. The method was ineffective in schizoaffective disorders, of limited use in neurotic depressions, but useful in retarded depression. Thyroid hormone has been shown to accelerate response to imipramine by A. J. Prange. It is suggested that the hormone is also useful combined with

tricyclic antidepressants in the treatment of resistant depressions in an outpatient setting.—*Journal summary.*

6524. **Faleni, Ricardo A.** (Hosp. Nacional Brailio A. Moyano, Inst. Nacional de Salud Mental, Buenos Aires, Argentina) **The use of high doses of fluphenazine in the treatment of psychotic patients.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 496-499.—Investigated the effects of fluphenazine, a "potent neuroleptic," on 21 22-55 yr. old hospitalized psychotic patients who had responded poorly to other psychotherapeutic drugs. 14 Ss were placed on high doses and 7 on low doses on a 3-mo treatment program. Results indicate that 12 of the high dosage Ss improved, and 9 were discharged. Of the remaining 5, only 2 showed no change. In the low dosage Ss, an increase in anxiety was observed without a correlated antipsychotic effect. It is concluded that high doses of fluphenazine (a) are beneficial to Ss who have resisted other treatments; and (b) are more efficacious than low doses, with similar or fewer side effects. Although side effects may appear sooner, "they are similar to those produced by other incisive neuroleptics and give way to specific medication."—*P. McMillan.*

6525. **Faretra, Gloria; Doohar, Lillian, & Dowling, Jean.** (Queens Children's Psychiatric Hosp., Queens Village, N.Y.) **Comparison of haloperidol and fluphenazine in disturbed children.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1670-1673.—Compared haloperidol, the new butyrophenone tranquilizer, with fluphenazine in a double-blind study in which 30 children (86.9% of which were schizophrenic) received each drug. The comparison was based on the effectiveness of the drugs in reducing the severity of several target symptoms and symptom clusters and on the overall improvement of the Ss during 8 wk. of drug administration. Results show that (a) both drugs were similar in overall improvement effectiveness (50+% in each drug group); (b) both drugs reduced anxiety effectively; (c) haloperidol was more effective in reducing provocativeness and autism and acted more quickly to control social and motor behavior symptoms, requiring 4 wk. for a significant change whereas fluphenazine took 8 wk.; (d) side effects were mainly extrapyramidal and easily controlled with biperden. It is concluded that haloperidol is an effective antipsychotic agent in the treatment of disturbed children.—*P. R. Shibelski.*

6526. **Fisher, Gary & Martin, Joyce.** (U. California, Center for Health Sciences, Los Angeles) **The psychotherapeutic use of psychodysleptic drugs.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 67-72.—The basic goal of the psychedelic approach is seen as enabling the patient to experience a transcendental state of consciousness which results in an identity with the life process. Drugs are said to make available to consciousness core experiences from the person's past which, when revived, can result in new attitudes being developed. The therapist's function is to be in intuitive contact with those states of consciousness and to be present for clarification, if needed. To do this the therapist is considered to need personal exposure to altered states of consciousness. A brief description of 1 patient's treatment is provided. (19 ref.)

6527. **Garber, Robert S.** (Carrier Clinic, Belle Mead, N.J.) **The impact of psychopharmacology on medicine and psychiatry.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 386-390.—Reviews the development and use of psychotropic drugs, with special emphasis on the

"modern era of psychopharmacology" that began with the use of chlorpromazine in France in 1952. Major recent texts in psychopharmacology are cited. The use of various antipsychotic and antidepressant drugs are critically reviewed, noting strengths and weaknesses (i.e., adverse side effects) of each. The impact of these drugs on research is also considered and the new possibilities afforded by complete technology. Some of the newer chemical agents, still under investigation, are examined. (20 ref.)—*P. McMillan.*

6528. **Garcia, J. Alves, et al.** (School of Medicine & Surgery, Rio de Janeiro, Brazil) **O problema problema terapêutico da insônia: II. Ensaio clínico com um novo sono-regulador butirofenônico.** [The therapeutic problem of insomnia: II. Clinical assays with a new sleep-regulator, butyrophenone.] *O Hospital*, 1969(Jul), Vol. 76(1), 77-86.—Reports the clinical bioassays with a new butyrophenone derivative, a fluorine compound with 2 piperidine nucleus, the dipiperon, which is described as a mood elevator, and as a phenothiazine-like drug it reestablishes encephalic and psychic homeostasis. The derivative is not a hypnotic drug, but a hypnoregulator medicine, in small doses, without producing in the patients the side effects so common in other somniferous remedies. It is concluded that dipiperon is really effective on the control of insomnia of any etiology. The 48 patients with insomnia submitted to treatment with dipiperon showed optimum results in $70.83 \pm 9.86\%$ and good results in $25.00 \pm 9.18\%$ of the cases.—*English summary.*

6529. **Goldberg, Harold L., DiMascio, Alberto, & Chaudhary, Basudeo.** (Boston State Hosp., Mass.) **A clinical evaluation of fluphenazine enanthate.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 46-47.—Evaluated the usefulness of parenteral long-acting prolixin enanthate (a major tranquilizer) in the management of 26 patients who were thought to sequester oral medication. Ss were divided into 2 groups of those who were to continue on oral phenothiazine medication and those to be treated with prolixin enanthate, (in most cases 25 mg. every 2 wk. for 6 mo.). The Brief Psychiatric Rating scale was administered to each S before and after clinical evaluations. Results indicate that prolixin enanthate was superior to the oral phenothiazine treatment, particularly with paranoid Ss. 70% of enanthate Ss showed mild to marked improvement, while 70% of controls showed no improvement or worsened. The drug was particularly useful in Ss treated at home, of whom many would have required hospitalization without this drug.—*P. McMillan.*

6530. **Goryachkina, M. V.** (Research Inst. of Child Infections, Leningrad, USSR) **Izuchenie terapevticheskoi éffektivnosti kortikosteroidov pri porazheniyakh tsentral'noi nervnoi sistemy parotitnoi étiologii.** [Study of the therapeutic effectiveness of corticosteroids in dealing with central nervous system lesions of parotitic etiology.] *Pediatriya*, 1970, Vol. 49(1), 11-12.—32 3-14 yr. old patients with severe forms of meningitis and meningo-encephalitis were observed in the study which utilized clinical tests and EEGs to trace the dynamics of recovery in the group receiving prednisolon and in a control group of 32 Ss not receiving it. The data demonstrate that (a) prednisolon promoted a more rapid restoration of disturbed cerebral functions, and (b) hormonal therapy should be introduced into the complex of therapeutic measures utilized.—*I. D. London.*

6531. **Greenspan, Kenneth, et al.** (National Inst. of

Mental Health, Chevy Chase, Md.) **Catecholamine metabolism in affective disorders: III. MHPG and other catecholamine metabolites in patients treated with lithium carbonate.** *Journal of Psychiatric Research*, 1970(Feb), Vol. 7(3), 171-183.—In each of the hypomanic patients, norepinephrine, epinephrine, and metabolites—normetanephrine, metanephrine, 3-methoxy-4-hydroxyphenylglycol (MHPG), and 3-methoxy-4-hydroxymandelic acid (VMA)—were greater during the pretreatment period. In the patients with agitated depressions, MHPG levels were lower during the pretreatment period; these values were also considerably lower than the MHPG levels observed in any of the other patients in this study. For the group as a whole, the excretions of normetanephrine and metanephrine decreased significantly when lithium carbonate was administered. The changes in the excretion of the catecholamines and the deaminated methylated metabolites VMA and MHPG, however, appeared to be more consistently related to changes in clinical state than to the administration of lithium carbonate, although a direct action of lithium carbonate cannot be excluded. (35 ref.)—R. V. Hamilton.

6532. Herrera, Julio J. & Espinosa, Nolberto. **La psicofarmacología y la psicoterapia breve en la clínica.** [Brief psychopharmacology and psychotherapy.] *Revista de Psiquiatría y Psicología Médica*, 1969(Apr), Vol. 9(2), 61-73.—Discusses, from the analytical-existential perspective, what role brief psychotherapy and psychopharmacology play in general medicine with special reference to clinical psychiatry, and analyzes: (a) how psychotherapy and psychopharmacology differ from other methods of therapy; (b) the meaning of the term "psycho" in determining methods of cure; (c) the "dimensions" of the patients "being" toward which psychotherapy and psychopharmacology are oriented; (d) whether the "psychic" contrasts with the "somatic" elements; (e) how an effect of a drug on a patient can differ from the "verbal" action of the doctor in psychotherapy; and (f) how psychotherapy and psychopharmacology resemble and differ from each other in psychic therapy. A phenomenological attitude is adopted while stressing the importance of the doctor-patient relationship. For the purpose of objectivity and effectiveness, the patient is studied as a "phenomena" that reveals itself as it is, free of causality. The "briefness" of brief psychotherapy is examined as 1 of intensity, extension (time), and depth, and is suggested to be a premechanism for all types of therapy. It is concluded that brief psychotherapy is effective in general and in psychosomatic medicine (although not in all cases, e.g., neurosis), and can be practiced by a general doctor.—S. Maze.

6533. Johnson, Gordon. (New York U., Medical School) **Differential response to lithium carbonate in manic depressive and schizo-affective disorders.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 613-615.—Observes that the use of lithium carbonate in the treatment of manic states has produced markedly different reactions in patients diagnosed manic depressive manic phase and schizophrenia schizoaffective excited phase. A study is described comparing the reactions of 19 manic Ss and 11 schizoaffective Ss with manic features, to lithium (1.5-3.5 gm/day). Results indicate that within 10-14 days: (a) clinical remission occurred in 79% of manic Ss with normalization of behavior, affect, and ideation; and (b) only 1 schizo-

affective S remitted while 55% showed worsening psychopathology. It is concluded that manic phase manic depressive and schizoaffective patients differ in psychological profiles, background factors, and clinical symptomatology, and show a marked difference in their responses to lithium. Rigid criteria for diagnosis is urged in the selection of patients for lithium treatment. A differential diagnostic scale designed to standardize and objectify clinical judgments is described. The scale includes social, familial, premorbid, and physiological factors, personality characteristics, course of illness, and present illness.—P. McMillan.

6534. Klee, Gerald D. (Temple U., Health Sciences Center) **Research in psychotherapy: An allegorical experiment.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 57-64.—Presents an objective comparison of 2 treatment modalities in a clinical setting. 33 18-65 yr. old patients were treated with penicillin and aspirin or with insulin and digitalis or not at all. After 3-6 mo. the results were the same for all 3 groups. The need for more elegant theory and for additional solid research is suggested.—D. Prager.

6535. Kline, N. S., Simpson, G. M., & Swenson, J. E. (Rockland State Hosp., Research Center, East Orangeburg, N.Y.) **Private ambulatory patients treated with fluphenazine enanthate.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 43-45.—Reports that long-acting parenteral fluphenazine enanthate is a unique therapeutic agent, despite the high incidence of extrapyramidal side effects. Results of treatment with 28 ambulatory schizophrenics and 13 manics indicate that large doses of the drug were more effective than smaller doses and permitted a greater interval of time between injections. Only 2 Ss averaged less than 25 mg/injection, while 8 Ss averaged from 35-75 mg. every 2 or 3 wk. for periods up to 4 yr. or more. Results were superior with schizophrenic Ss; with manic Ss, the drug provided sufficient control to administer lithium. It is concluded that without this drug, a substantial number of the Ss would have required hospitalization.—Journal summary.

6536. Knobel, Mauricio. (U. Buenos Aires, Brazil) **Elementos extrafarmacológicos en psiquiatría y medicina psicósomática.** [Extrapharmacological elements in psychiatry and psychosomatic medicine.] *Revista de Psiquiatría y Psicología Médica*, 1968(Jan), Vol. 8(5), 263-266.—Acknowledges the existence of the "placebo effect" and its limitations on the use of the double-blind methods in pharmacological research. The revision of various pharmacological studies using different drugs confirms the existence of various extrapharmacological factors. The attitude of the doctor toward the medication and especially the attitude of the patient prior to taking the medication are emphasized. The antidrug effect must be taken into consideration, not only for the purpose of pharmacological research, but also for direct medical use. Patients with an antidrug attitude must be given psychotherapy before or at the same time as the medication. The importance of the antidrug effect variable in pharmacology will allow research in this field to confirm the true effectiveness of the various drugs used. (16 ref.)—S. Maze.

6537. Lambert, P. A. & Marcou, G. (Hôpital de Bassens, Chambéry, France) **Fluphenazine enanthate given to inpatients and outpatients.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 63-65.—Administered fluphenazine enanthate to 57 16-79 yr. old outpatients and 53 inpatients. Average length of

treatment was 13 mo., although some Ss required more than 2 yr. A comparison of inpatients with outpatients indicates that (a) outpatients needed less fluphenazine enanthate than inpatients, (b) time between injections was longer for outpatients, and (c) injections were well tolerated without biological changes. The most frequent side-effects were asthenia, depression, and chronic dyskinesia. Fluphenazine enanthate is particularly adapted to long-term treatment, and reduces potential toxicity by reducing the amount of major tranquilizer given. The drug is useful for most chronic psychotic patients, particularly rehabilitated schizophrenics.—*Journal summary.*

6538. **Lehmann, H. E.** (McGill U., Montreal, Quebec, Canada) **The philosophy of long-acting medication in psychiatry.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 7-9.—Suggests that certain types of acute and chronic psychotic patients can best be kept on medication through injections of long-acting antipsychotic preparations. These patients include (a) acutely disturbed, aggressive and agitated catatonics; (b) delusional and extremely rigid paranoids; (c) outpatients who are doing well on maintenance therapy, but who often forget or decide against taking medication and thus risk relapse; and (d) dangerous, homicidal paranoids, who although recovered and nondelusional, will remain well only while on medication. The advantages of weekly or biweekly injections are discussed to insure that this type of patient is kept on medication regularly. It is suggested that legislation be passed requiring that such patients present themselves at predetermined intervals at a clinic to receive injections of long-acting antipsychotic preparations.—*P. McMillan.*

6539. **Leite Naves, Armando.** (Goode Hope Clinic, Belo Horizonte, Brazil) **Tratamento das síndromes depressivas com a Clorimipramina.** [Treatment of depressive syndromes with chlorimipramine.] *O Hospital*, 1969(Jul), Vol. 76(1), 113-119.—Reports results obtained with chlorimipramine (anafranil) in 16 Ss with endogenous depressions, 15 Ss with situational depressions, 2 Ss with obsessive neuroses, 8 Ss with prepsychotic personalities, 3 Ss with schizophrenic depressions, and 1 Ss with an organic depression. From this group, 16 Ss experienced a complete remission of symptoms, while 16 Ss experienced good results. 7 Ss achieved moderate improvement, and 6 Ss remained unchanged.—*English summary.*

6540. **Lowenthal, U.** [Placebo treatment.] *Harefuah*, 1970(Jul), Vol. 79(2), 64-67.—Reviews the use of placebos in medical practice. A placebo is an inert substance without known biologic significance which is administered to the patient instead of a pharmacologically active substance. While the placebo has been introduced mainly as a tool in drug research, it is also an important therapeutic tool. The placebo is viewed as a "concrete symbol of support" in the doctor-patient relationship, which "helps the patient to gather inner strength and reduce his suffering." (English summary). (60 ref.)—*E. Donchin.*

6541. **Maillet-Jurquet, A., et al.** (Clinique Mon Repos, Marseille, France) **La chlorimipramine traitement majeur des états dépressifs: A propos de 103 cas, traités par perfusion intraveineuse.** [Chlorimipramine effectiveness in the treatment of depressive states: 103 cases, treated by intravenous perfusion.] *Encéphale*, 1970(Mar), Vol. 59(2), 180-188.—Diagnoses included, for 35 males and 68 females, neurotic depressions,

involuntal depressions, hypochondriacal depressions, and some atypical depressions. It is concluded that chlorimipramine (anafranil) was an effective antidepressant when iv perfusion was used. This form of treatment was though suitable to replacing ECS in endogenous depressions. It was also felt to be effective in neurotic depressions.—*W. W. Meissner.*

6542. **McKnelly, W. V., Tupin, Joe P., & Dunn, Marvin.** (U. Kansas, Medical Center) **Lithium in hazardous circumstances with one case of lithium toxicity.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 279-286.—Given a reasonably healthy person, the risk is minimal if the dose, serum level, and clinical course is carefully monitored by a person experienced in the use of lithium. Extreme caution must be exercised and exceptional justification must exist before lithium is used in patients with kidney or heart disease. 4 case histories are presented.—*D. Prager.*

6543. **McNair, Douglas M., et al.** (Boston U., Medical School) **Persistence of a drug-personality interaction in psychiatric outpatients.** *Journal of Psychiatric Research*, 1970(Jul), Vol. 7(4), 299-305.—This follow-up study reevaluated 4 small groups of psychiatric outpatients who, 4 mo. earlier, had completed a double-blind trial of diazepam. A drug-personality interaction demonstrated during the 2-wk trial that "high acquiescer-placebo" and "low acquiescer-diazepam" groups improved significantly more than "high acquiescer-diazepam" and "low acquiescer-placebo" groups. The follow-up data supported 2 principal conclusions about the long-range combined effects of medication and personality: they can modify patients' reactions to subsequent treatment, and they also can endure for a considerable period. Thus, the same 2 groups who improved most during the clinical trial significantly less often prematurely quit their subsequent therapy and, further, they maintained their significantly greater symptomatic improvement 4 mo. later.—*R. V. Hamilton.*

6544. **Mella, P. I.** (St. Patrick's Hosp., Dublin, Ireland) **Prophylactic lithium: A double-blind trial in recurrent affective disorders.** *British Journal of Psychiatry*, 1970(Jun), Vol. 116(535), 621-624.—Performed a double-blind trial on 18 patients with recurrent affective disorders. The superiority of lithium over sodium bicarbonate (placebo) just failed to be significant at the 5% level. One case of serious toxicity occurred. Results lend corroborative evidence to the hypothesis that lithium has a prophylactic action. (15 ref.)—*Journal summary.*

6545. **Merlis, Sidney; Sheppard, Charles A., Collins, Lois, & Fiorentino, Diane.** (Central Islip State Hosp., N.Y.) **Polypharmacy in psychiatry: Patterns of differential treatment.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1647-1651.—125 men and 375 women, were randomly selected from a group of 1350 patients treated with combinations of psychoactive medications. Each patient had been on his treatment combination for a minimum of 30 days prior to admission to the study and was considered relatively stabilized before initial assessment. Interviews and records of manifest pathology on the 18-item Brief Psychiatric Rating Scale (BPRS) and judgment of degree of mental illness on a 7-point scale were assessed. Evenly divided into 3 groups, 1 group was taken off medications completely (with placebo being replaced for the normal medication); the 2nd group had 1 placebo substituted for

an active medication; and, the 3rd group remained on original medication. Reevaluation was performed after a 30-day period. Results show that men, unlike women, do not respond nearly as well to therapy under polypharmacy methods. Implications were drawn from this data concerning the ineffectiveness of polypharmacy in males.—*Journal summary.*

6546. **Pisciotta, Anthony V.** (Marquette Medical School, Milwaukee, Wis.) **Agranulocytosis Induced by certain phenothiazine derivatives.** *JAMA: Journal of the American Medical Association*, 1969(Jun), Vol. 208(10), 1862-1868.—Clinical and hematologic characteristics suggest that development of agranulocytosis is "related to a possible suppressive effect of phenothiazines on cell division. This suggests that even before exposure to chlorpromazine, sensitive patients have a less efficient mechanism for cell division...." It is concluded that "one may be able to identify chlorpromazine-sensitive patients because his marrow cells show limited incorporation of ³H-thymidine. (17 ref.)—*P. McMillan.*

6547. **Platz, Arthur; Panepinto, William C., Kissin, Benjamin, & Charnoff, Stanley M.** (State U. New York, Downstate Medical Center, Brooklyn) **Metronidazole and alcoholism: An evaluation of specific and non specific factors in drug treatment.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 631-636.—Reports a double-blind study with 169 clinic outpatients evaluating the use of metronidazole in the treatment of alcoholism. This drug (initially thought to reduce the craving for alcohol and cause mild antibuse-like reactions during drinking) has shown contradictory results in previous studies. In the present study metronidazole and placebo were administered in identical 250-mg capsules. During each clinic visit, Ss answered questions concerning regularity of taking medication, amount and frequency of drinking since the last appointment, and occurrence of any unusual side effects. Results indicate no difference between placebo and drug groups in (a) regularity of clinic visits, (b) reported periods of abstinence, (c) overall ratings of improvement, and (d) incidence of adverse side effects. Various patient variables (including influence of race and social class) are also discussed. It is noted that Ss were remarkably consistent in their drinking patterns (i.e., 69% of Ss abstinent at the 1st rating were also abstinent at the last, while only 19% of those drinking were abstinent at the final rating). It is concluded that the best predictor of abstinence at the end of treatment is not mode of treatment or type of drug to be used, but the patient's drinking behavior prior to treatment. (28 ref.)—*P. McMillan.*

6548. **Prange, Arthur J., et al.** (U. North Carolina, Medical School, Chapel Hill) **Use of a thyroid hormone to accelerate the action of imipramine.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 442-444.—Reports that triiodothyronine (T₃), in a dose too small to produce toxicity or factitious hyperthyroidism, can be used to enhance the therapeutic action of imipramine in retarded or nonretarded depressed patients. Whatever the thyroid state of the patient, T₃ and imipramine may interact to elevate central adrenergic activity.—*Journal summary.*

6549. **Robinson, S. & Dasberg, H.** (Talbieh Psychiatric Hosp., Jerusalem, Israel) **Observations on melleril-induced EEG changes in mental patients and their relationship to course and outcome of the illness.** *Israel Annals of Psychiatry & Related Disciplines*,

1969(Nov), Vol. 7(2), 201-212.—Investigates the correlation between EEG aberrations caused by phenothiazine derivatives and the clinical course and outcome of mental illness in 20 24-60 yr. old patients exhibiting anxiety, psychomotor restlessness, and affective disturbance. Ss were treated with thioridazine in dosages varying from 75-400 mg/day. 3 types of development in EEG aberrations were found: (a) normal EEG; (b) slowed background activity with theta and delta waves, and slowing of alpha rhythm and heightened amplitude; and (c) alteration of background activity as mentioned in b with reversible paroxysmal activity. Characteristics of each type are illustrated by a case history. Areas for further research are discussed.—*G. Steele.*

6550. **Schlemper, M. S., Hustinx, A., Kooyman, M., & Janssen, R. H.** (State U., Leyden, Netherlands) **Measurement of depression.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Mar), Vol. 72(2), 225-241.—Describes EEG variables which may be indications of the degree of attention or intention of the patient. In order to investigate whether these variables are negatively correlated with degree of depression, a quantitative method was sought to assess the severity of the depression. The course of the depression in patients treated with amitriptyline or a placebo was followed using a double-blind crossing-over method. The severity of the depression was ascertained by means of the method of Shapiro and with the Leyden Assessment Scales. 4 assessment lists were developed to be used by: (a) psychiatrists, (b) therapy leaders, (c) nursing staff, and (d) patients for self-assessment. Results obtained with 4 patients are discussed. There was generally good agreement between the different methods of observation used. Some limitations of the methods studied are given.—*Journal summary.*

6551. **Shepherd, M.** (U. London, Inst. of Psychiatry, England) **Therapeutic problems with psychotropic drugs: Some epidemiological considerations.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Nov), Vol. 72(6), 503-506.—Examines the contribution of epidemiological inquiries to the evaluation of treatment for mental disorders. Examples are given of studies which examine the impact of psychotropic drugs on populations of psychiatric patients in hospital and in the community. Results indicate the need to include social factors among the criteria of therapeutic efficacy.—*Journal summary.*

6552. **Simpson, George M.** (Rockland State Hosp., Research Center, East Orangeburg, N.Y.) **Long-acting, antipsychotic agents and extrapyramidal side effects.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 12-14.—Discusses the concept of long-acting drugs and describes their usefulness. Long-acting, extrapyramidal side effects are shown to be no different than those of routine antipsychotic drugs, although the onset may be different and the dystonic reactions more bizarre. The extrapyramidal effects of the enanthate and the decanoate drugs are easily treated; the decanoate is noted to be the longest-acting and probably has fewer side effects.—*Journal summary.*

6553. **Spring, Gottfried K., Schweid, Daniel; Steinberg, Joel, & Bond, Douglas.** (University Hosp. of Cleveland, O.) **Prophylactic use of lithium carbonate? More data concerning its use in manic depressive illness.** *JAMA: Journal of the American Medical Association*, 1969(Jun), Vol. 208(10), 1901-1903.—Presents the case histories of 9 manic patients who received

lithium carbonate after an acute manic attack and were followed up for 3 mo. to 1 yr. 5 of the 9 patients relapsed. It is concluded that a cautious and critical approach to the prophylactic use of lithium carbonate is necessary.—*Journal abstract.*

6554. Stern, Francis H. (St. Joseph's Hosp., Philadelphia, Pa.) **Use of a new antidepressant in the female climacteric.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 464-466.—Reports a preliminary trial of a new psychostimulant compound (pyrovalerone hydrochloride) in the treatment of mental and emotional symptoms associated with the menopause. Ss were 20 45-65 yr. old patients from private office practice whose durations of symptoms ranged from 2-12 yr. The 10-wk treatment period included periodic laboratory studies. Results show significant body weight loss and an increase in insomnia. Combined ratings by Ss and therapists suggest that over 1/2 of Ss showed improvements in the symptoms of fatigue, depressed mood, and boredom. It is concluded that further clinical evaluation in a controlled double-blind study of this drug is justified.—P. McMillan.

6555. van der Helm, H. J. & de Jonghe, F. E. (U. Amsterdam, Neurological & Psychiatric Clinics, Netherlands) **Determination of psychotropic drugs in body fluids.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Nov), Vol. 72(6), 507-512.—Investigates individual differences in the therapeutic and toxic effects of drug therapy by examining the relationship between plasma concentration and effect. Absorption, rate of elimination, and metabolism are factors affecting plasma concentration. The procedure for the determination of the plasma concentration of psychotropic drugs is described. It is concluded that plasma concentration is "a likely aid in rationalizing drug therapy and might well lead to a reduction of the vast number of drugs and combinations of drugs now in use."—G. Steele.

6556. Wilson, Ian C., Alltop, Lacoe B., & Riley, Lewis. (Dept. Health, Raleigh, N.C.) **Tofranil in the treatment of post alcoholic depressions.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 488-494.—Assigned 40 consecutive, female, postalcoholic depressed patients, aged less than 60 yr., to receive either 50 mg. 3 times a day tofranil (an antidepressant) pamoate liquid or equivalent dosage of placebo. The intensity of depression was evaluated initially and then at weekly intervals over a 6-wk study period on both an O and subjective rating scale. Data indicate that both treatment groups showed significant improvement over time. The active treatment group showed significantly more improvement on both rating scales than the placebo group. Generally the most substantial differences occurred in early weeks of treatment. Item analysis of items in both the Hamilton Rating scale and Self-Rating Depressive scale defined different patterns of individual symptom improvement. In general, the physiological depressive symptoms showed the most remarkable beneficial response to tofranil therapy. (16 ref.)—*Journal summary.*

6557. Wintrob, Ronald M. (U. Connecticut, Health Center, Hartford) **Long acting phenothiazines and long term psychotic patients: The role of fluphenazine enanthate in treatment.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 50-62.—Administered fluphenazine enanthate in 25 mg. intramuscular biweekly injections to 14 therapy resistant Liberian patients with a history of severe and recurrent psychotic reactions. 10 Ss responded favorably to the

drug. The onset of action was variable, with a range of 3 days-2 wk. being most representative. An asymptomatic fall in blood pressure of 5-15 mm. Hg. was also characteristic. Extrapyramidal reactions occurred in 9 Ss, but were adequately managed with oral anticholinergic drugs and did not impede the continued use of the drug. It is concluded that fluphenazine enanthate is effective in the treatment of therapy resistant patients with long-term psychotic illness.—*Journal summary.*

HOSPITAL CARE & INSTITUTIONALIZATION

6558. Camp, Ruth P. & Onnembo, Florence. (Western Connecticut State Coll.) **Discharged psychiatric patients' visits to a former treatment center: A nursing dilemma.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Jul), Vol. 6(4), 213-218.—Studied number and nature of expatients' visits to a small psychiatric treatment center where most patients stay for over 6 mo. to obtain insight into: (a) the transition problems that occur when patients leave a hospital, (b) the role of the nurse as seen by the patient, and (c) characteristics in the organizational and social structure of the hospital which might be related to why and how expatients return.—M. Daniels.

6559. Green, Hattie. (Stockton State Hosp., Calif.) **Patients speak out.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Sep), Vol. 6(5), 279-283.—Surveyed 15 patients about to be discharged from an acute psychiatric female unit of a state hospital to determine their opinions concerning the therapeutic effectiveness of hospital employees and to find out what is important to patients.

6560. Jablon, Norman C., Sadoff, Robert L., & Heller, Melvin S. (State Maximum Security Forensic Diagnostic Hosp., Holmesburg Prison, Philadelphia, Pa.) **A unique forensic diagnostic hospital.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1663-1667.—Describes a maximum security prison in which the purpose of the 100-bed unit is to extensively test and analyze those defendants who have been classified as having violent criminal behavior. Following completion of the 60-day testing procedure, which is performed within the security of a prison atmosphere by a university staff in law and psychiatry, certain recommendations are made on each of the pretrial or presentencing patients. Representative samplings are offered, showing the success of the program to date. Out of 27 people on probation, 20 have not yet been involved in any mental or legal difficulties. The realization that the program is but the 1st step towards better methods of treatment of criminally violent people does not overshadow the apparent success of the program. A brief analysis of the program by H. G. Modlin follows the report.—P. R. Shibleski.

6561. Moosbrucker, Jane & Spivak, Mark. (Boston Coll.) **The therapeutic community: A study of identification.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 55-69.—Found that hospitalized mental patients who identified more with the chief psychiatrist were more likely to improve than patients who identified less. Identification was defined as becoming more like the group leader wanted them to be in their attitudes toward the hospital milieu and was measured by a questionnaire, the Patient Role Inventory. Ss were 16 male and 21 female psychiatric patients. Ss whose individual psychotherapists were in conflict with

the chief psychiatrist were less likely to identify with the chief than Ss whose therapists were not in conflict. Ss who identified with the group leader were more likely to perceive their therapists and other staff members as supportive of the leader and the group meetings even if they were not. S improvement was not related to therapist conflict or perception of staff support, i.e., it was only related through the use of identification as an intervening variable. (34 ref.)—*Journal abstract*.

6562. Munoz, Rodrigo A., Tuason, V. B., & Dick, Earl. (Malcolm Bliss Mental Health Center, St. Louis, Mo.) **Psychiatric emergency room service patterns.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 185-189.—Asserts that the success of the emergency room is based on precision in diagnostic formulations, early intervention in stress situations, and utilization of community resources. Social workers and visiting nurses are essential in promoting and maintaining changes necessary to the patient's reintegration into the community.—D. Prager.

6563. Napolitani, Diego. (Centro di Socioterapia "Villa Serena," Milan, Italy) **Approccio psicoanalitico alla sociodinamica delle istituzioni psichiatriche.** [Psychoanalytic approach to the social dynamics of psychiatric institutions.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1970(Mar), Vol. 31(2), 144-169.—Suggests that custodial psychiatric institutions tend to assume defensive structures belonging to the schizoparanoïd type; psychiatric hospitals tend to assume obsessive structures (treatment oriented) and therapeutic communities tend to assume hysterical structures. (French, English, & German summaries)—L. L'Abate.

6564. Pokorny, Alex D. (Veterans Administration Hosp., Houston, Tex.) **Moon phases and mental hospital admissions.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Nov), Vol. 6(6), 325-327.—Examined the relationship of daily psychiatric hospital admissions, suicides, and homicides over a 3-yr period to moon phases and apogee-perigee cycles in lagged and unlagged comparisons. A significant relationship was found with hospital admissions.

6565. Schneider, P. B., Chistoni, G. C., Baron, P., & Meylan, D. (U. Lausanne, Psychiatric Polyclinic, Switzerland) **Le logement des malades d'un service psychiatrique ambulatoire.** [Accommodation of patients in a psychiatric ambulatory service.] *Social Psychiatry*, 1970(Oct), Vol. 5(4), 202-211.—Investigated the physical accommodations of 100 patients using a university psychiatric clinic. Type of accommodation, size of dwelling, the way in which the accommodation was obtained, and degree of patient satisfaction were considered. Associations between these facts and sociocultural data concerning the course of study, professional training and activity are discussed. Data indicate no striking difference between the accommodation of the patient population and that of the general population. Within the patient sample, there appeared to be more association between dwelling, sex of patient, and sociocultural factors, than between dwelling and type of psychiatric problem. (German abstract)—*English abstract*.

6566. Tisza, Veronica B., Hurwitz, Irving, & Angoff, Kristine. (Harvard Medical School, Boston, Mass.) **The use of a play program by hospitalized children.** *Journal of the American Academy of Child Psychiatry*, 1970(Jul), Vol. 9(3), 515-531.—Studied the play activity of hospitalized children in the playroom of a hospital for

children, emphasizing the emotional processes and their behavioral manifestations which help the child to recover from the acute trauma and to regain the ability to use play in the service of mastery. The project was restricted to the description and analysis of observational data during the 1st 3 days in the playroom, and is a combined cross-sectional and longitudinal study. 3-4, 4-6, and 6-8 yr. olds served as Ss. The reaction of the Ss to hospitalization, their attendant modes of relating to adults and to peers, and their use of toys are examined and described. The importance of the continuity of supportive relationships for young hospitalized children is demonstrated. If relationships are offered, not even the 3-4 yr. olds experience the absence of the parent as so profound a loss, because of the relative stability of the introjected image of the parent. However, results indicate that the external and internal threats inherent in the hospital experience create so much anxiety that, at least during the 1st 3 days in the playroom, Ss are largely unable to master the situation through dramatic play. During the initial period of hospitalization they either regress or struggle against regression, with resultant primitivization or even absence of play activity. (33 ref.)—*Journal summary*.

PSYCHOANALYTIC INTERPRETATION

6567. Bressler, Bernard. (Duke U., Medical Center) **The ego ideal.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 158-174.—Clarifies the various usages of the term "ego ideal," including a review of Freud's and current definitions. The origin of the ego ideal is discussed as "the replacement of earlier feelings of omnipotence." The relationships between ego ideal and superego, shame, guilt, adolescence, and the group are discussed. The methods of psychoanalysis for dealing with the ego ideal are included. (28 ref.)—G. Steele.

6568. Caruso, Igor A. **Sirve el psicoanálisis de coartada social?** [Is the psychoanalysis of social repression useful?] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1970(Jan), No. 14, 3-9.—Discusses the role of psychoanalysis in situations where sociopolitical changes are inevitable. The human condition is regarded as a model of conflict between desire and reality. The necessity of conflict in the socio- and ontogenesis of man is considered basic to the psychoanalyst as a representative of the reality principle. The ambivalence of the Utopia phenomenon is thought to represent a test for the psychoanalyst in which his role is to explore the motivations for social repression and objectively examine governmental authority.—P. Hertzberg.

6569. Chadoff, Paul. **Una crítica de la teoría de Freud acerca de la sexualidad infantil.** [A critique of Freudian theory on infantile sexuality.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1970(Jan), No. 14, 10-16.—Examines some of the consequences of blind acceptance of Freud's theory of infantile sexuality and proposes a return to Freud's primary viewpoints, but with modifications. It is noted that the psychoanalytic literature reveals 3 basic themes in relation to Freudian theory on infantile sexuality: (a) sexual perversions of adult life and nongenital adult sexuality, (b) recuperation or reconstruction of infantile sexual life during psychoanalysis, and (c) direct observation of infants and children. It is suggested that more attention should be focused on the parents than on the children because

sexual disturbances may develop from a pathological family situation.—P. Hertzberg.

6570. Levenenz, Lanquair D. (U. California, Berkeley) **A psychoanalysis of American literature.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 763.

6571. Mitscherlich, Alexander. (Sigmund Freud Inst., Frankfurt am Main, W. Germany) **Introducción a la mesa redonda sobre protesta y revolución.** [Introduction to the round table on protest and revolution.] *Revista de Psicoanálisis*, 1969, Vol. 26(3), 631-642.—Examines psychoanalytic bases for political activism, noting the influence of ego, superego, and id on behavior. Protest and revolution are defined and the roles of the individual and groups are examined. It is suggested that the role of a psychoanalyst in a situation of protest or revolution should be to investigate how the antagonists maintain their basic instinctive needs, i.e., grade of sublimation, type of objectal relations, types of defenses. (17 ref.)—P. Hertzberg.

6572. Orgel, Samuel Z. **The unconscious.** *Samiksa*, 1968, Vol. 22(1), 1-22.—Explores Freud's topographic theory, dividing the psychic apparatus into systems on the basis of their relationship with consciousness (unconscious, preconscious, and conscious, together with the intersystemic censor), and his structural theory of id, ego, and superego roles in the development and organization of mental functions. Regression is discussed in terms of both theories, as modified by Freud and others, including the concept of regression of ego functions, after which hypotheses on regressive ego functions are viewed within the framework of the psychodynamics of normal development, neurosis, and psychosis. (27 ref.)—T. N. Webster.

6573. Rosenfield, Israel. (Queens Coll., City U. New York) **Freud: Character and consciousness: A study of Freud's theory of unconscious motives.** New York, N.Y.: University Books, 1970. 190 p. \$5.95.

6574. Salas, Eduardo J. (Coronel Diaz 1731, Buenos Aires, Argentina) **Un enfoque psicoanalítico de las identificaciones en Dorian Gray: La psicopatía y la perversión.** [A psychoanalytic look at the identifications in "Dorian Gray": The psychopathology and perversion.] *Revista de Psicoanálisis*, 1969, Vol. 26(3), 643-667.—Presents an analysis of Oscar Wilde's *Dorian Gray* which traces the sources of psychopathology and perversion that lead the character to suicide. Consideration is given to Dorian's symbolic parental couple, and their perverse influence on his adult life. Dorian's precarious equilibrium and its rupture is analyzed, noting his double life and the intensification of his aggressions. Dorian's suicide is attributed to an irreversible psychosis. The renunciation of his identity is equated with the renunciation of life. It is hypothesized that there are 3 types of identification; fecundating, gestatory, and digestive-metabolic. (English & French summaries) (24 ref.)—P. Hertzberg.

6575. Thomas, Glen R. (Emory U.) **The Freudian approach to James's "The Turn of the Screw": Psychoanalysis and literary criticism.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 770.

PSYCHODIAGNOSIS

6576. Block, William E. **A phenomenological-existential view of causation in relation to projective test data.** *Psychiatric Quarterly Supplement*, 1968, Vol.

42(1), 4-21.—Presents a case study to illustrate the phenomenological-existential approach to psychological test data. Only the existential method, and not the genetic mode of investigating test data, keeps the clinician open to actually experiencing the data.—D. Prager.

6577. Davis, Leo J. & Swenson, Wendell M. (Mayo Clinic & Foundation, Rochester, Minn.) **Factor analysis of the Wechsler Memory Scale.** *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 430.—Submitted the Wechsler Memory Scale to a factor analysis to determine if more than 1 substantive dimension was present. Ss were 622 15-87 yr. old patients. 2 clear-cut correlated ($r = .62$) factors were found, suggesting that the scale "might... be analyzed in terms of a Memory Quotient or individual subtests. Such analysis might yield clinically useful distinctions between psychiatric and neurologic patients and between subgroups within these 2 broad categories."—M. West.

6578. Dickes, Robert; Simons, Richard C., & Weisfogel, Jerry. (State U. New York, Downstate Medical Center, Brooklyn) **Difficulties in diagnosis introduced by unconscious factors in the interviewer.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 55-90.—States that difficulties in both diagnosis and therapy are ubiquitous and have been attributed to experience, nosologic problems, theoretical orientation, age, sex, and religion of interviewers. However, an examination of the material presented by the patient reveals it to be of the type that impinges on the "universal and unacceptable drives present in all people," and therefore the cause of error stems from the deeply repressed unconscious constellations present in all interviewers. Several clinical studies support the hypothesis. (90 ref.)—D. Prager.

6579. Dinoff, Michael; Stenmark, David E., & Smith, Robert E. (U. Alabama) **Comparison of video-tape and face-to-face interviewing.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 53-54.—Interviewed 1 highly verbal S via a standardized video-taped presentation of E followed later by a live E reading the same library of utterances from a script to S in a face-to-face encounter. Temporal data of the 2 interview techniques are quite similar.—*Journal abstract*.

6580. Dinoff, Michael, et al. (U. Alabama) **Reliability of video-tape interviewing.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 275-278.—Testing 12 normal male and 12 female Ss twice within approximately 24 hr. on a standardized video-tape interview showed high reliability in temporal speech characteristics ($rs = .57-.99$). The potential of the use of such an instrument as a tool in clinical research is discussed.—*Journal abstract*.

6581. Dodd, Jack L. (U. Arizona) **The nosology of unhappiness and craziness.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 36-37.—Indicates that a nosology which uses "objective static terms to describe relative, subjective, interactional phenomena" is not logical. It is suggested that a diagnosis would take into account, not just the patient, but the patient in relation to his world. It is pointed out that definitions are relative, and when one attempts to study a patient, one alters the field.—S. R. Greenwald.

6582. Hamilton, M. (U. Leeds, England) **Standardised assessment and recording of depressive symptoms.** *Psychiatry, Neurology, Neurochirurgia*, 1969(Mar), Vol. 72(2), 201-205.—Argues that standardized records ignore the unique aspects of a patient's

illness and are concerned only with selected common elements. The selection depends on the purpose of the record and on the theoretical orientation of the interviewer. Records are classified into self-assessment data and ratings by Os. The advantages and disadvantages of these scales are considered and some specific scales are reviewed in detail.—*Journal abstract.*

6583. Harris, Richard J., Wittner, William; Koppell, Bert, & Hilf, Franklin D. (U. New Mexico) **MMPI scales vs. interviewer ratings of paranoia.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 447-450.—Reports that 3 subscales of the MMPI (Schizophrenia, Paranoia, and Stein's recently devised Suspicion scale) had low positive correlations with 2 interview-derived indices of paranoia. Ss were 44 patients who had been classified by the staffs of their wards as either clearly paranoid or clearly nonparanoid.—*Journal abstract.*

6584. Jackson, Basil. (Marquette U., Medical School) **The revised Diagnostic and Statistical Manual of the American Psychiatric Association.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 65-73.—Discusses the inadequacies of the Diagnostic and Statistical Manual of Mental Disorders (DSM-II). Among those aspects described as "less than desirable" are: (a) lack of a clear and concise definition of such rudimentary terms as symptom, syndrome, and symptom complex; (b) classification of neurosis as a disease entity; and (c) inadequate childhood psychiatric disorders sections. An alternate system is proposed and commonly used terms are defined.—P. R. Shibelski.

6585. Kendell, R. E. (Maudsley Hosp., London, England) **The classification of depressive illness: The uses and limitations of multivariate analysis.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Mar), Vol. 72(2), 207-216.—Examines different types of multivariate analyses of clinical data from patients with depressive illnesses to reveal the fundamental relationships underlying the variety of symptom combinations. The statistical techniques are described and the theoretical requirements for establishing a disease entity are defined. Their inherent limitations and the nonexistence of clearly defined entities are examined. Either way, most studies have been handicapped by the poor quality of their original clinical data. The low reliability of clinical ratings obscures any distinctions or boundaries that may be present; and their liability to be biased by the rater's diagnostic preconceptions tends to create spurious distinctions. These deficiencies would be reduced if information was elicited by standardized interviewing procedures. Although no discrete entities have yet been defined, there is now broad agreement on the main dimensions of depressive symptomatology and the positions of individual patients on these dimensions can be identified either by factor scores or by a diagnosis score derived from a discriminant function analysis. It is concluded that this provides a more satisfactory means of characterizing patients than does a traditional clinical diagnosis. (26 ref.)—*Journal summary.*

6586. Knights, Robert M. & Watson, Peter. (U. Western Ontario, London, Canada) **The use of computerized test profiles in neuropsychological assessment.** *Journal of Learning Disabilities*, 1968(Dec), Vol. 1(12), 696-709.—Describes the development and use of standard score profile programs based on psychological tests for evaluating the patterns of abilities and deficits in children with various types of brain damage or dysfunction. The test profile is described and

comments are made on: the collection of normative data, standard score characteristics, standard deviation limits, age change problems, and the use of a summary score. Cases are presented on a 9-yr-old boy with a brain tumor and a 13-yr-old boy with a history of learning problems. The technique of profile interpretation is illustrated, and the test scores are related to the medical history. A 2nd computer program which selects the test profiles most similar to any criterion case, from all the previous cases, in an effort to develop a technique for improved classification, is described.—*Journal abstract.*

6587. León, Carlos A., Climent, Carlos E., Estrada, Harold, & Jaramillo, Ramón. (U. del Valle, Faculty of Medicine, Cali, Colombia) **Assessment of instruments for studying the prevalence of mental disorders.** *Social Psychiatry*, 1970(Oct), Vol. 5(4), 212-215.—Assessed 86 men and 101 women from a semirural Colombian town for mental disorders. Ss completed the Health Opinion Survey (HOS) questionnaire, and a checklist (filled in by an informant) from the Family Identification Questionnaire. In 33 cases, a psychiatric interview was given. A comparison of results indicates that (a) The mean HOS score did not differentiate between the mentally ill Ss (assessed at interview) and normal Ss, nor did it indicate a diagnosis. The mean score of mentally disordered Ss, however, was significantly lower than that of normal Ss. (b) The checklist did identify a small proportion of the mentally ill Ss, but gave no information about type of disorder. (c) A 2nd psychiatrist agreed with the diagnosis of the 1st (using the same collected material) in a satisfactory number of cases, but they did not agree on the indication for psychiatric treatment. (French & German abstracts)—*Journal abstract.*

6588. Liem, G. Ramsey, et al. (U. Rochester) **Some correlates of early-detected emotional dysfunction in the schools.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 619-626.—Studied clinical judgments of early-detected emotional dysfunction in relation to a battery of adjustment, parent attitude, sociometric, and achievement measures given at the end of the 3rd grade. The ratings, made on a 7-point health-pathology scale, correlated in meaningful ways with the criterion variables attesting to the sensitivity of the early detection procedure. (25 ref.)—*Journal abstract.*

6589. Maxson, Linda S. & Neuringer, Charles. (U. Kansas) **Evaluating legal competency.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 267-273.—Attempted to discover whether the MMPI could be used to differentiate the legal competency status of individuals referred to state mental hospitals. The protocols of 538 male competent and 56 male incompetent individuals were examined and compared. The data indicated that there was a greater amount of overall mental disturbance in the incompetent group as compared to the competent patients, and that the former group was much more confused and suspicious than the latter Ss. Cutoff score identification tables were constructed for the differentiating scales.—*Journal summary.*

6590. McKenzie, D. J. & Wilson, P. E. (Child Guidance Clinic, Canberra, Australian Capital Territory) **A pilot study of the Bristol Social Adjustment Guides used with pre-school children.** *Australian Psychologist*, 1969(Mar), Vol. 3(3), 177-180.—Reports a pilot study with 20 preschool children in which objective data from interviews supports the suggestion that the Bristol Social Adjustment Guides (BSAG) are useful in early identification of emotional problems of preschool children.

However, it is concluded that the BSAG require further development and inclusion of items more appropriate to the activities of children of this age group.—*M. Maney.*

6591. **Poslavy, A.** (Willem Arntsz Hoeve, Den Dolder, Netherlands) **Behaviour and the possibility of quantitating behaviour.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Sep), Vol. 72(5), 447-454.—Possibility and feasibility of quantitating behavior in clinical practice depend on the problems which the psychiatrist has to solve. After a review of various aspects of the clinicians work, it is concluded that quantification of behavior is most feasible in those situations in which it is most needed, i.e., in those situations in which the patient does not respond well to treatment endeavor. In these situations quantification can refine the information on which new therapeutic decisions can be made. (18 ref.)—*Journal summary.*

6592. **Schultz, J. H.** (17 Bayernallee, Berlin, W. Germany) **Die Verantwortung für die Diagnose.** [The responsibility for the diagnosis.] *Praxis der Psychotherapie*, 1968(Dec), Vol. 13(6), 253-263.—Emphasizes the extreme importance of carefully ruling out all possible differential diagnoses before beginning treatment with psychotherapy or psychoanalysis. Briefly reports cases of patients who received only psychotherapy or psychoanalysis and died as a result of the lack of medical or surgical treatment.—*B. A. Stanton.*

6593. **Schwarz, I. Gene.** (U. Cincinnati, Medical School) **Observation on the "process" of psychiatric evaluation.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 248-255.—Illustrates the unreliability of the tools of psychiatric evaluation and suggests the possibility that what is being sampled in microcosm in a diagnostic interview is the patient's capacity to adapt as shaped by the uniqueness and development of his psychic apparatus. For the evaluation to have significance, both S and evaluator must be studied. Via training, personal experience, and/or personal therapy, the doctor in clinical practice must develop the capacity for self scrutiny and analysis. In clinical research the diagnostic interview may be of additional value when viewed from the perspective of studying the evaluator effect on the process.—*Journal summary.*

6594. **Seva Díaz, Antonio & Salvanes Pérez, Roberto.** **Valor de lo comicial en ciertas psicosis delirantes.** [Value of diagnosis in certain delirious psychoses.] *Revista de Psiquiatría y Psicología Médica*, 1968(Jan), Vol. 8(5), 267-275.—Analyzes the probability that there are many psychopathological cases which are mistaken for schizophrenic psychotic cases and gives an example of a patient whose diagnosis was made by confusing different possibilities. An epileptic condition was diagnosed which, by facing an unfavorable environment (in this case immigration) activates the endogene (partial schizophrenic predispositions of Luxemburger). This, in turn, becomes a delirium schizophreniform psychosis and appears to be a "Gran Mal" attack when juxtaposed with an acute psychic environmental trauma. By delving deeper into the psychopathology of these patients and by progressing further with the means of diagnosis, the term "schizophrenia" will be less abused.—*S. Maze.*

6595. **Tien, H. C.** (World Journal of Psychosynthesis, Lansing, Mich.) **Organic Integrity Test (OIT) in monitoring drug effects.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 445-455.—Tested the Organic Integrity Test (OIT) to confirm its validity as a test of organicity, independent of other psychological tests and clinical

judgments. A 1-yr EEG-OIT correlation study was made on 456 adult patients. Data, including the age, EEG abnormality index, OIT score, and clinical diagnosis of each S, were processed at a university computer center. The t test revealed that the OIT is a better test in detecting organic brain dysfunction such as psychosis, e.g., schizophrenia, than the EEG. The overall OIT-EEG correlation ($r=.39$) would indicate that the OIT is a useful test. The effective psychotropic agents (e.g., chlorpromazine, thioridazine, etc.) can reverse the low OIT scores in schizophrenia, involutional psychosis and other organic brain disorders. The profitable use of the OIT time-graph to monitor drug therapy in 667 patients with various diagnoses on a neuropsychiatric ward is described. It is concluded that the OIT time-graph is applicable to all neuropsychiatric patients as a daily diagnostic and therapeutic index. (22 ref.)—*Journal summary.*

6596. **van Praag, H. M.** **Behaviour and the possibility to quantitate behaviour: An account.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Sep), Vol. 72(5), 425-428.—Purports that the use of psychotropic drugs, biological psychiatry, psychotherapy, projective tests, and experimental psychology require a more "strict objectivizing and quantitating approach" to psychiatric diagnosis. As a result, the question is raised of what to objectivize and quantify and how to find the "optimum between the 2 extremes" of hard vs. soft facts in psychiatric diagnosis. The sources of diagnostic information, somatic examination, case history, clinical observation, and empathy are examined.—*G. Steele.*

6597. **Vestre, Norris D. & Zimmermann, Robert.** (Washington State U.) **Validation study of the Psychotic Inpatient Profile.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 3-7.—Obtained validity data on the Psychotic Inpatient Profile (PIP), a revision of the Psychotic Reaction Profile, by comparing ratings of closed- (locked) ward ($N=71$) vs. open-ward ($N=87$) patients and admissions ($N=52$) vs. releases ($N=54$). Discriminant analyses differentiated the groups in each comparison at the .01 level. Correct classification was obtained for 84.2% of the Ss in the closed vs. open comparison and for 75.5% in the admissions vs. releases comparison. Univariate tests indicate that all 12 PIP scales discriminated between groups in the expected direction in at least 1 of the 2 comparisons made.—*Journal abstract.*

6598. **Vossen, J. M.** (U. Nijmegen, Netherlands) **The possible utility of quantification of behaviour in psychiatry.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Sep), Vol. 72(5), 481-489.—In the behavioral sciences it is of essential importance to distinguish between observations of behavior and inferences drawn from these observations. Behavior defined as the whole of the activities of the effector organs of a living organism constitutes a common starting-point for all behavioral sciences; inferences, on the contrary, are derived from theories, which are particular to a given branch of science. By using behavior as the common starting-point, it becomes possible to place observations, made in psychiatry with respect to normal and abnormal behavior phenomena, against the background of results and theories, originating from experimental, animal, and physiological psychology. This procedure can only be successful to the extent to which psychiatry succeeds in describing and quantifying observable behavior as exactly as possible. (16 ref.)—*Journal summary.*

6599. Weiss, A. A., Robinson, S., & Winnik, H. Z. (Talbieh Psychiatric Hosp., Jerusalem, Israel) "Obsessive psychosis": Psychodiagnostic findings. *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 175-178.—Contends that obsessive psychosis may be considered a specific nosological category to be differentiated on the levels of classification, prognosis, and treatment from both compulsion neurosis and schizophrenia. Psychodiagnostic findings on 18 patients with a diagnosis of obsessive psychosis as opposed to compulsion neurosis are reported, and clinical criteria for differentiating this group are defined.—*Journal abstract*.

6600. Zwaan, E. J. (State U., Psychiatric Clinic, Utrecht, Netherlands) Towards the measurement of depressive states. *Psychiatria, Neurologia, Neurochirurgia*, 1969(Mar), Vol. 72(2), 243-248.—Developed methods for measuring the effectiveness of antidepressive drugs. 13 5-point rating scales were designed, 4 to be used by psychiatrists, 9 to be filled in by nurses. The use of these rating scales is facilitated by explicit descriptions given for each point on each scale. These descriptions were added in the expectation that they might enlarge the interrater reliability. Results indicate that: (a) Psychiatrists rate depressive symptoms according to a normal distribution model. Consequently, sums of ratings also tend to be normally distributed. Therefore, syndromes are not likely to show up, if operationally defined as sum scores of ratings on selected scales. (b) On the basis of quantitative rating, vital depression symptomatology cannot be distinguished from general severity of depression. (c) A factor analysis of the ratings reveals retarded depression and agitation to be relatively independent factors. (d) Little information is lost if the severity of depressive states is measured by a few relevant items only. Interrater reliability might be raised by use of descriptions of the depressive states and symptoms (as to kind and degree) to which these items refer.—*Journal summary*.

BEHAVIOR DISORDER

6601. Giel, R., Bishaw, Makonnen, & van Luijk, J. N. (Haile Sellasie I. U., Medical School, Addis Ababa, Ethiopia) Behaviour disorders in Ethiopian children. *Psychiatria, Neurologia, Neurochirurgia*, 1969(Jul), Vol. 72(4), 395-400.—Found that psychiatrically disturbed Ethiopian children are absent in out- and inpatient populations and in schools for various reasons such as the scarcity of medical services. However, surveys of the general population and of a remand home show that behavior disorders are definitely a problem in Ethiopia. Of children up to 9 yr. old, 3-4% were found to suffer from psychiatric illness compared with 5-10% of 10-19 yr. old children. Of the boys in the remand home, 46% were found to be psychiatrically ill. Bedwetting was one of the most frequent complaints, occurring in 4-5% of 5-14 yr. old children.—*Journal summary*.

6602. Safer, Daniel J. (Johns Hopkins Hosp., Children's Medical & Surgical Center, Baltimore, Md.) Establishing boundary lines for families of children with behavior disorders. *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 86-97.—Asserts that children with behavior problems usually come from homes with high tension, lack of parental union, inappropriate permissiveness and punishment, and lack of family cohesion. Where family conflict is recurrent, boundaries

between parents, child, and community become skewed and the family's ability to handle the child's deviant behavior becomes limited. Examples of boundary-line conflicts and their resolution are presented.—*D. Prager*.

6603. Von Hilsheimer, George. *How to live with your special child: A handbook for behavior change*. Washington, D.C.: Acropolis Books, 1970. 272 p. \$7.50.

Drug Addiction

6604. De Leon, Ovidio. Epidemiología del consumo de psicoestimulantes entre universitarios peruanos. [Epidemiology of the consumption of psychostimulants in Peruvian universities.] *Revista de Neuro-Psiquiatria*, 1969(Mar), Vol. 32(1), 17-32.—Discusses information gained through a 54-questionnaire investigating (a) general character; and (b) the causes, effects, and characteristics of an individual drug addiction. 1256 students in 3 Peruvian universities were issued the questionnaire between December 1965 and January 1966. Results were analyzed by the chi square technique. General results show 18.8% of the Ss could be considered normal drug users, while 1.1% could be considered addicted. Women were found to be the predominant drug users. A greater number of Ss who took drugs for medical reasons became dependent than those who took them for other reasons. The most frequent reason for taking stimulants was for increased intellectual performance. A statistically significant relation between depression or alcoholic intoxication and dependent Ss suggests that drugs produce dependence in Ss with previous psychological disorders. The causes of drug addiction are speculated and suggestions for preventative and therapeutic measures are made. (English, French, & German summaries) (61 ref.)—*P. Hertzberg*.

6605. Jaffe, Jerome H., Schuster, Charles R., Smith, Beth B., & Blachley, Paul H. (U. Chicago) Comparison of acetylmethadol and methadone in the treatment of long-term heroin users. *JAMA: Journal of the American Medical Association*, 1970(Mar), Vol. 211(11), 1834-1836.—Examined the possibility that di- α -acetylmethadol hydrochloride, with a 72-96 hr. duration of action period, might be as effective in treating long-term heroin users as methadone hydrochloride, which must be taken at least every 24 hr. 21 volunteer patients from the methadone clinic of a drug abuse program were stabilized for 2 wk. on methadone and divided into an experimental group of 12 receiving acetylmethadol 3 days a wk. and a placebo on intervening days, and a control group of 9 receiving the methadone daily in a placebo container. Substitution of a placebo for 6 Ss in each group in the 7th wk. allowed for observation of withdrawal effects. On each clinic visit measures were obtained from completed forms from the opiate withdrawal subscale of the Addiction Research Center inventory, a symptom check list designed to measure intensity of withdrawal, and interviews. Results from the 16 Ss completing the study indicate no difference between groups in any measures during the observation period. Drug termination produced a marked rise in control group withdrawal complaints after 48 hr., and in experimental group complaints after 96 hr. The practical advantages of acetylmethadol and the problem of side effects in patients dropped from the study are discussed.—*R. Wiltz*.

6606. Jönsson, L. E., Schuberth, J., & Sundwall, A. (Ulleråker Hosp., Psychiatric Research Center, Uppsala,

Sweden) **Amphetamine effect on the choline concentration of human cerebrospinal fluid.** *Life Sciences*, 1969(Sep), Vol. 8(17, Pt. 1), 977-981.—Measured the choline concentration of the lumbar cerebrospinal fluid (CSF) of 8 amphetamine-dependent adults during amphetamine intoxication and after detoxification. It was found that the choline level was significantly higher during the intoxication period than after. Results are discussed in view of the known amphetamine effect on the acetylcholine (ACh) release from brain cortex. Barbiturate anesthesia decreased the release of ACh from the exposed cortex of cats and rabbits, when local application of eserine was used to preserve the released transmitter. In dogs, barbiturate anesthesia also decreased the concentration of the ACh metabolite choline in the CSF. The choline concentration in CSF of patients acutely admitted to hospital due to amphetamine intoxication was examined.—*Journal abstract.*

6607. **Robinson, S. & Winnik, H. Z.** (Talbieh Psychiatric Hosp., Jerusalem, Israel) **Motivation for the addiction to amphetamine and reducing drugs.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 213-222.—Presents the psychodynamics of amphetamine addiction in a 25-yr-old female and a 17-yr-old male. Conflicts connected with the ties to the mother image and separation from the mother in early infancy are seen as a background from which the addiction arose. The noxious influence of the drug and the addiction to it leading to mental disorders are discussed. (26 ref.)—*Journal abstract.*

Alcoholism

6608. ———. **Nikolai Vital'evich Kantorovich.** *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 471-472.—Recounts the life and work of N. V. Kantorovich (1901-1969), whose contributions were primarily in the fields of alcoholism and narcomania, and psychogeny.—*I. D. London.*

6609. **Beard, James D.** (U. Tennessee, School of Basic Medical Sciences, Memphis) **Fluid and electrolyte abnormalities in alcoholism.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 502-503.—Reviews alcohol diuresis and concludes that "rather than dehydration, over-hydration is commonly associated with excessive ethanol ingestion when a normal diet has been maintained." Therapy for alcoholics often includes the use of intravenous fluids, since it is commonly held that the alcoholic is dehydrated. Ethyl alcohol, however, acts as a diuretic only as long as the level of blood alcohol is increasing. "Once the blood alcohol level peaks, plateaus or declines, an antidiuresis ensues." An experimental study with dogs given ethyl alcohol, and a clinic situation involving 45 well-nourished chronic alcoholic patients, tested on admission and compared with 30 controls, reveal in both cases that consumption of ethyl alcohol increased the total body water, the extracellular fluid volume, and the plasma volume. When the alcoholics were retested 4 days after admission the total body water had returned to normal range following abstinence from alcohol.—*P. McMillan.*

6610. **Cornwell, Georgia.** (U. California, Santa Barbara) **Factors in interpersonal and family relationships and alcoholism.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Sep), Vol. 6(5), 274-278.—Discusses the positive reinforcement given by society and family relationships to the development of

alcoholism. Factors in early childhood development, responsibilities in early adulthood, fears associated with marriage, and marital relationships are examined in relationship to their reinforcing role in alcoholism development. It is suggested the family of the alcoholic and not just the alcoholic should be the unit for treatment.—*M. Daniels.*

6611. **Goldstein, Gerald; Neuringer, Charles, & Klappersack, Bernard.** (Veterans Administration Hosp., Topeka, Kan.) **Cognitive, perceptual, and motor aspects of field dependency in alcoholics.** *Journal of Genetic Psychology*, 1970(Dec), Vol. 117(2), 253-266.—Investigated various cognitive, perceptual, and motor skills related to Rod and Frame Test performance in alcoholic, nonalcoholic, and brain-damaged patients. It was hypothesized that such performance is related to postural orientation, visual postural and analytic skills and that field-dependent alcoholics should demonstrate more impairment of postural orientation than should field-independent nonalcoholics. This prediction was not confirmed, but it was found that the major differences in performance between field-dependent and field-independent Ss were on tests of visual-postural and analytic skills. (16 ref.)—*Author abstract.*

6612. **Gross, William F. & Alder, Linda O.** (Veterans Administration Hosp., Lexington, Ky.) **Psychological Reports**, 1970(Oct), Vol. 27(2), 431-434.—Administered the Tennessee Self-Concept Scale to 140 male alcoholics when they voluntarily entered a 60-day alcoholic treatment program. Ss differed significantly in a negative direction from the standardization group on 10 scales. Test results suggest that Ss' derogative self-perceptions are general and not specific to narrow phases of personality and behavior.—*Journal abstract.*

6613. **Hoffmann, Helmut.** (Minnesota State Hosp., Willmar) **Personality characteristics of alcoholics in relation to age.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 167-171.—Reports normative data for the Personality Research Form (PRF) on 4 different age groups of 377 hospitalized male alcoholics. Significant differences of means among age groups were found on 15 of the 22 personality scales. In comparison with a control group, alcoholics score significantly higher in abasement, affiliation, cognitive structure, harmavoidance, nurturance, order, and succorance, but significantly lower in achievement, aggression, autonomy, change, dominance, endurance, exhibition, play, and sentence.—*Journal abstract.*

6614. **Kaij, Lennart.** (U. Lund, Malmö, Sweden) **Biases in a Swedish social register of alcoholics.** *Social Psychiatry*, 1970(Oct), Vol. 5(4), 216-218.—Reports a study, drawn from a population census, of 138 men above age 15 with alcohol abuse. Ss were divided into 2 groups of those whose abuse was officially registered (O-group), and those whose abuse was known from other sources (A-group). The groups were compared on a number of social and medical variables. Results indicate significantly more psychotic and probably fewer asthenic persons in the O-group. In other respects, the O-group was representative of all alcohol abusers in the sample. Implications of the findings are discussed. (French & German abstracts)—*Journal abstract.*

6615. **Knott, David H.** (Tennessee Psychiatric Hosp. & Inst., Memphis) **Medical management of the alcohol withdrawal syndrome.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 504-505.—Characterizes with-

drawal from alcohol as either acute, subacute, or chronic. Pathophysiology of the acute withdrawal syndrome (including delirium tremens) involves (a) fluid and electrolyte imbalance, (b) abnormalities in blood glucose, and (c) associated disorders (including concomitant infections, i.e., gastritis, pancreatitis, and hepatitis). Subacute withdrawal is less well defined and is manifested by loss of appetite, insomnia, depression, episodes of anxiety and agitation, gastrointestinal complaints, etc. Chronic withdrawal involves psychological dependency on the euphoric and tranquilizing properties of alcohol. A comprehensive psychosocial rehabilitation program is required for this phase.—*P. McMillan.*

6616. Martínez, Floyd H. (Texas Technological U.) **A crosscultural study of the psychological aspects of alcoholic and tuberculous-alcoholic patients.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 398-399.

6617. Rimmer, John & Chambers, Donald S. (Renard Hosp., St. Louis, Mo.) **Alcoholism: Methodological considerations in the study of family illness.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 760-768.—Compared information obtained from alcoholics about the prevalence of psychopathology in their 1st-degree relatives with the prevalence obtained in a personal examination of these same relatives. Data were collected by administering a systematic interview to 147 alcoholics and 395 of their 1st-degree relatives. The number of positives for psychopathology increased by 175% when the relatives were interviewed. Results reveal no difference in reliability by S's sex, socioeconomic status of the S, or by nature of the relative.—*Journal abstract.*

Suicide

6618. Lester, David. (Suicide-Prevention & Crisis Service, Buffalo, N.Y.) **Personality correlates associated with choice of method of committing suicide.** *Personality*, 1970, Vol. 1(3), 261-264.—Males who completed suicide using active methods were compared to those using passive methods for their scores on the MMPI. No differences were found. Similarly, no differences in MMPI scores were found between those shooting themselves and those hanging themselves.—*Author abstract.*

6619. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Suicidal behavior, sex, and mental disorder.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 61-62.—Predicted that sexual status, a diagnosis of neurosis vs. psychosis, and attempting vs. completing suicide should be associated in the general population. An examination of available data gave some support to this hypothesis.—*Journal abstract.*

6620. Lester, David; Reeve, Calvin I., & Priebe, Kitty. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Psychological Reports, 1970(Aug), Vol. 27(1), 210.—Failed to replicate A. D. Pokorny's finding of a seasonal variation in the births of completed suicides. The exact date of birth for 285 completed suicides for the period 1966-1969 was recorded. A chi-square goodness of fit test indicated that the actual distribution of births among the sample did not differ from the expected, and no year-to-year consistency was found.—*M. West.***

6621. Levenson, Marvin & Neuringer, Charles. (U. Kansas) **Intropunitiveness in suicidal adolescents.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 409-411.—Evaluated the hypo-

thesis that intropunitiveness is the fundamental dynamic underlying the self-destructive behavior of suicidal individuals (especially suicidal adolescents). 13 suicidal, 13 psychiatrically disturbed but not suicidal, and 13 normal adolescents were administered the Rosenzweig Picture-Frustration Test. Their protocols were scored for intropunitiveness. No significant differences in intropunitiveness scores were found among the 3 groups. It is concluded that the hypothesis needs to be reexamined. (20 ref.)—*Journal abstract.*

6622. Ostow, Mortimer. (5021 Iselin Ave., Riverdale, N.Y.) **Suicide and social responsibility.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 138-144.—Proposes that there is a social instinct which, when activated, arrests the drive for individual libidinal gratification, inactivates self-preservative tendencies, and endows injury with pleasure-giving potential. The social instinct is normally activated at times of danger to family or community. When the danger arises from the individual's own hostility, the hypothetical social instinct would then encourage suicide. The individual's self-sacrifice protects the group.—*Journal abstract.*

6623. Rosenbaum, Milton & Richman, Joseph. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Suicide: The role of hostility and death wishes from the family and significant others.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1652-1655.—Interviewed 35 suicidal and 15 nonsuicidal patients to determine a possible link between suicidal behavior in the patient and hostility, ambivalence, and death wishes from the patient's family and important friends. Over 1/2 of the suicidal Ss believed that someone wished them dead; while among the nonsuicidal Ss none reported such feelings. Further interview of family and friends of the suicidal Ss seemed to substantiate the view. Although there is contained in the suicidal Ss an undeniable factor of aggression, it is felt—through theory and actual examples—that the family and friends of the suicidal S and their positive or ambivalent and negative attitudes toward the S's suicidal wishes have a distinct effect on his subsequent actions.—*P. R. Shibleski.*

6624. Simon, Werner & Lumry, Gayle K. (Veterans Administration Hosp., Minneapolis, Minn.) **Suicide of the spouse as a divorce substitute.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 608-612.—Reports a study of 9 patients whose spouses had committed suicide and of 31 former patients who suicided following hospitalization, stressing the role of interpersonal marital problems. At the time of suicide, 60% of Ss had serious marital discord; 18 were either separated or divorced, and 5 reported divorce threats. A majority suffered from various types of depression; 11 had a high feminine interest score on the MMPI, indicating poor masculine identification. A similar finding was observed in 4 husbands of wives who suicided. Alcoholism and drug dependence were observed in 19 Ss, and 4 Ss whose wives suicided had a serious problem with alcohol and 1 had a problem with drugs. Examples are given of 2 murder-suicide combinations and of suicide in response to situations involving religious differences, delusional states, and dependency problems. Genuine suicide notes are cited to illustrate the divorce substitute hypothesis. The roles of the surviving member and the suicided spouse are discussed from the standpoint of hostility, punishment, separation, and guilt as they pertain to an extrapunitive motive for revenge. (17 ref.)—*Journal summary.*

6625. Stengel, Erwin. (U. Sheffield, England) **Recent progress in suicide research and prevention.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 127-137.—Discusses recent developments in the study and prevention of suicide, including: (a) the unreliability of suicide statistics; (b) high risk groups, e.g., the old and sick, physicians, and university students; (c) the effect of the legal viewpoint; (d) differentiation of 2 suicide and attempted suicide populations differing in size, sex, age distribution, and methods; (e) use of "cohort studies" of unselected samples of attempted suicides; and (f) lack of progress in the methods of descriptive clinical psychology. Contrary to traditional views, suicide attempts are viewed as complex behavioral acts stemming from conflicting motivations. 4 classifications of preventive measures and lay organizations for suicide prevention are discussed. (23 ref.)—G. Steele.

Crime

6626. Allen, Harry E. (Ohio State U.) **Bio-social correlates of two types of anti-social sociopaths.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 841.

6627. Coffman, Routh N. (George Washington U.) **Role-taking defects as correlates of criminality and mental illness in offender populations.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 910-911.

6628. Kessley, Seymour & Moos, Rudolf H. (Stanford U., Medical School) **The XYY karyotype and criminality: A review.** *Journal of Psychiatric Research*, 1970(Feb), Vol. 7(3), 153-170.—The behavioral phenotypes of XYY males, like chromosomally normal ones, are the result of both genotypic and environmental processes. To ascribe to a single chromosome specific behavioral effects fails to take account of a broad range of pertinent environmental factors and ignores the fact that the phenotype is a result of the total integrative properties of the genome interacting with the environment. (108 ref.)—R. V. Hamilton.

6629. Kinzel, Augustus F. (New York State Psychiatric Inst., New York) **Body-buffer zone in violent prisoners.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 59-64.—After psychiatric screening, 14 inmates (8 violent and 6 nonviolent) were chosen from the United States Medical Center for Federal Prisoners to ascertain the comparative measurements of the body-buffer zone of the 2 groups. Each S was placed in a 20 x 20 ft. room and instructed to indicate when he felt that the E had come "too close." Results show that violent prisoners required a body-buffer zone, approximately 4 times larger than nonviolent prisoners. It is concluded that potentially violent prisoners could be screened more easily and efficiently upon admission to an institution, emphasizing that violent behavior may be a sign of distinct psychopathological tendencies.—P. R. Shibelski.

6630. McCullough, James P. & Adams, Henry E. (U. Georgia) **Anxiety, learning sets, and sociopathy.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 47-52.—Attempted to determine if lack of ability to profit from past experience was characteristic of primary or secondary sociopaths. 22 sociopathic and 23 matched normal Ss were divided into high- and low-anxiety groups on the basis of the Lykken Activity Preference

Questionnaire, the MA scale, and the Welsh Anxiety Index. Using a modified Wisconsin General Test Apparatus, Ss were given a series of problems in order to observe the rate of formation of learning sets, this being 1 method for determining whether S profits from past experience. "Learning to learn" occurred in all groups. There were no significant differences among the 4 groups regardless of the anxiety scale used. If either secondary or primary sociopaths do exhibit an inability to profit from past experience, then it may be only in learning situations which involve noxious stimuli.—*Journal abstract.*

6631. Persons, Roy W. & Marks, Philip A. (Antioch Coll.) **Self-disclosure with recidivists: Optimum interviewer-interviewee matching.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 387-391.—Interviewed 78 male inmates. 6 interviewers interviewed an equal number of Ss chosen from the 3 most frequently occurring MMPI high-point code types. The interviewers, 1/2 of whom were college students and the other 1/2 inmates, came from the same 3 MMPI code types. The Ss became more self-disclosing over time. There were no significant differences in the student interviewers' and inmate interviewers' ability to elicit intimate responses. However, certain personality traits were associated with being intimate with college interviewers while other personality characteristics were associated with being intimate with inmate interviewers. Interviewee intimacy was greatest when the interviewees had the same MMPI code type as their interviewer. Matching on interviewer-interviewee guilt was significant. (16 ref.)—*Journal abstract.*

6632. Rotenberg, Mordechai. (U. California, Berkeley) **Relevant audience and organismic involvement as interacting variables with self-identity: The social types in prison.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 829.

Juvenile Delinquency

6633. Davies, John F. (Ohio State U.) **Differential perceptions of delinquent behavior.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 841.

6634. Hooke, James F. (Virginia Commonwealth U.) **Rating delinquent behavior.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 155-158.—Questions the utility of classifying all juvenile offenders under the single rubric of "delinquent" and presents 2 systems for classifying offenders according to the delinquent act. The 1st is a rating scale for severity. Correlations among the ratings of 13 judges ranged from .56-.93, with a mean of .77. 10 judges rated direction of aggression—against people, against property, general asocial. The percentages of items on which each judge agreed with each of the other judges ranged from 70-97. 34 offenses were rated, and a 9- and a 5-point scale of severity are presented.—*Journal abstract.*

6635. Persons, Roy W. (Antioch Coll.) **Psychometric evaluation of sociological factors in a boys' reformatory.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 407-413.—Administered a psychological assessment battery to 1011 15-19 yr. old boys in a reformatory to evaluate the milieu and the psychological impact of incarceration. Data indicate that increased incarceration results in greater psychopathology and criminal identification. The continuation of antisocial identification was especially pronounced with Ss who had had prior

incarcerations. Ss who got into trouble and were housed in disciplinary quarters tended to be anxious or neurotic rather than sociopathic. Reliability, validity, normative, and base-rate data are provided, and methodological implications discussed.—*Journal abstract.*

6636. Stewart, Denton J. & Resnick, Jerome H. (Temple U.) **Verbal conditioning and dependency behavior in delinquents.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 357-377.—Verbally conditioned 33 delinquents and 33 matched nondelinquents using dependent and aggressive verbs. It was hypothesized that delinquents, in contrast to nondelinquents, would reject verbalizations of dependency behavior because of their previous reinforcement history. The use of aggressive verbs was investigated for empirical reasons. Results support the hypothesis. Implications of the results for the treatment of delinquents by conventional therapeutic methods are discussed. (18 ref.)—*Journal abstract.*

Homosexuality & Sexual Deviation

6637. Fisher, Gary & Howell, Leisla M. (U. California, Center for Health Sciences, Los Angeles) **Psychological needs of homosexual pedophiliacs.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 623-625.—Reports analysis of 50 males who were convicted of homosexual pedophilia. Data reveal that Ss were of average intelligence, had a mean age of 40 yr., were 84% white and 88% single, and that 56% had molested children unknown to them. EPPS scores suggest that Ss: (a) had similar need structures to heterosexual pedophiles; (b) had different need structures than adult normal males; (c) were low in achievement orientation, inner direction, and assertiveness; and (d) were guilt-ridden and analytically introspective with respect to their own and others' motives. An inconsistent and unexplained finding is a higher heterosexual drive.—*Journal summary.*

6638. Fraas, Louis A. **Sex of figure drawing in identifying practicing male homosexuals.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 172-174.—Attempts to differentiate practicing male homosexuals via certain psychological indices, MMPI masculinity-femininity scale, CPI masculinity-femininity scale, and sex of human figure drawing. Neither scale was instrumental in differentiating homosexuals. While the comparison of sex of figure drawing between 9 practicing male homosexuals and 9 controls only demonstrated a trend in the predicted direction, a similar comparison with hospitalized United States Army males, both medical (N = 45) and neuropsychiatric (N = 28), was significant.—*Journal abstract.*

6639. Green, Richard. (U. California, Medical School, Los Angeles) **Persons seeking sex change: Psychiatric management of special problems.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1596-1603.—Describes a variety of issues that can be expected to arise in the course of the transsexual patients' management. Since a multitude of informative data is not available pertaining to the psychiatric handling of the transsexual, such data obtained from experience is viewed as most helpful. Typical reactions by the transsexual (both male and female) are reported covering areas, i.e., the route of referral to the psychiatrist and the transsexual's motivation for sex reassignment. Additional information pertaining to the elimination of miscon-

ceptions about the medical and surgical procedures involved (both pre- and postoperative measures) are discussed. The patient's social transition into the new gender role, the use of psychiatric medications and the handling of the patient's other family members is also covered. The patient's emotional problems during the postoperative period, the high degree of anticipation of a "better future," and the subsequent disappointments are to be expected and should be dealt with adequately. Because of the controversial nature of the patient's clinical condition, an openminded attitude is required in treating the transsexual patient.—*P. R. Shibelski.*

6640. Manosevitz, Martin. (U. Texas) **Early sexual behavior in adult homosexual and heterosexual males.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 3(76, Pt. 1), 396-402.—A sample of 50 men, 28 overt homosexuals and 22 heterosexuals, completed a Life History Questionnaire and an MMPI. The questionnaire contained items on education, occupation, physical and mental health, marital status, and sexual development and current functioning. Ss were obtained from non-clinical and nonprison populations and were fairly well matched. The homosexual group was significantly higher than the heterosexual group on D, Mf, Pt, and Sc of the MMPI. The homosexual group mean was above 70 only on the MF scale. Significant differences were found in partners, total sexual activity, and early sexual experiences at various ages. The developmental sequence of sexual activity for homosexuals and heterosexuals follows orderly, although different progressions. It is suggested that the prehomosexual child becomes sexually active earlier than the preheterosexual.—*Journal abstract.*

6641. Money, John & Brennan, John G. (Johns Hopkins U., Medical School) **Achievement versus failure: Intelligence, education and career in seven female transsexuals.** *Journal of Learning Disabilities*, 1969(Feb), Vol. 2(2), 76-81.—Reports results on the WAIS for 7 female transsexuals who had completed or begun surgical and hormonal sex reassignment. Ss tended to be average or above average in intelligence, relatively superior on verbal as opposed to numerical or mechanical abilities, and high in vocational achievement. No "stereotypically masculine intelligence-test pattern of response" was found.—*S. Appella.*

MENTAL DISORDER

6642. Carney, M. W. (382 Clifton Dr., N., St. Annes on Sea, England) **Serum vitamin B₁₂ values in psychiatric in-patients.** *Diseases of the Nervous System*, 1970(Aug), Vol. 31(8), 566-569.—Carried out serum B₁₂ estimations on 374 psychiatric inpatients admitted consecutively from a defined geographical area to a mental and a general hospital. 53 Ss had serum B₁₂ levels of 150 pg/ml. or less, 49 of whom belonged to the following diagnoses: organic psychoses, endogenous depression, schizophrenia, and neurotic depression. This distribution varied significantly from that of the whole group. 16 Ss had serum B₁₂ levels below 100 pg/ml. Hematological abnormalities were not significantly more common among low serum B₁₂ Ss than among Ss with normal B₁₂ serum levels. Data indicate that among low B₁₂ Ss (a) 49% had received drugs (mainly phenothiazines and barbiturates) during preadmission, (b) 60.4% had been ill for more than 1 yr., (c) 30.2% were classified as severely undernourished, and (d) 28.3% had concomitant physical disease. The most striking result was the high incidence of low serum B₁₂ levels in a

representative sample of major mental illness in a defined community. It is concluded that low serum vitamin B12 values are common in psychiatric patients and that vitamin B12 estimation is a useful screening procedure.—*Journal summary.*

6643. Cohen, Melvin; Klein, Donald F., & Struve, Fred. (Hillside Hosp., Glen Oaks, N.Y.) **Relationship between electroencephalographic and sociometric variables among psychiatric patients.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 97-101.—Related social interactions of 78 15-38 yr. old nonchronic hospitalized psychiatric patients to their EEG patterns. On the basis of Ss' listing of others in their unit that they liked the most, and those that they disliked the most, Ss were divided into 3 groups: (a) isolates, Ss receiving no positive and few negative votes; (b) rejectees, Ss receiving more positive than negative votes; and (c) populars, Ss receiving more than 7 positive and no more than 1 negative vote. Results show that normal EEG Ss were more popular than those with either a 14 or 6 EEG pattern, who tended to be socially rejected or those with other EEG abnormalities, who tended to be socially isolated.—P. R. Shibelski.

6644. Coppen, A. (Medical Research Council, Neuro-psychiatric Unit, Carshalton, England) **Defects in monoamine metabolism and their possible importance in the pathogenesis of depressive syndromes.** *Psychiatra, Neurologia, Neurochirurgia*, 1969(Mar), Vol. 72(2), 173-180.—Examines the role of biogenic amines in the etiology of depressive illness. Drugs, such as reserpine, which deplete the CNS of these amines can produce the depressive syndrome in a proportion of mentally normal Ss. Drugs, such as imipramine or the MAO inhibitors which increase the amount of free amines in the brain can alleviate a depressive illness. Feeding tryptophan which is the amino acid precursor of the indoleamines has an antidepressant effect. Feeding the precursor of the catecholamines has not been found to have any antidepressant effect. Investigations into the metabolism of the indoleamines in depressed patients have shown that the urinary excretion of tryptamine and the concentration of 5-hydroxy-indoleacetic acid in cerebrospinal fluid is reduced in this condition. The concentration of hindbrain 5-hydroxytryptamine and hydroxyindoleacetic acid is reduced in depressed Ss who died by suicide. It is concluded that the biogenic amines, and the indoleamines are abnormal in states of depression and that this abnormality is of etiological importance. (18 ref.)—*Journal summary.*

6645. Coppen, A. (Medical Research Council, Neuro-psychiatric Research Unit, Carshalton, England) **Disorders of mineral metabolism in depressive patients.** *Psychiatra, Neurologia, Neurochirurgia*, 1969(Mar), Vol. 72(2), 189-193.—Reviews the evidence for changes in electrolyte metabolism in depressive illness. Results show that during depression Ss have reduced extracellular water and increased residual sodium, that is intracellular sodium and a small amount of exchangeable bone sodium. After recovery these values return to normal. Total body potassium and intracellular potassium is low both before and after recovery. The etiological importance of these findings is discussed. The increase in residual sodium does not appear to be greatly affected by changes in sodium and water intake or by diuretics but it is shown that the aldosterone antagonist, spironolactone can considerably reduce this fraction of exchangeable sodium. (17 ref.)—*Journal abstract.*

6646. Favazza, Armando R. & Schaefer, Donald L. (U. Michigan, Health Services) **Arranging for air transportation of the mentally ill.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 93-96.—Outlines various methods and suggestions to be used in transporting a mentally ill patient by public airlines. Since no set standardized rules are in existence between the various airlines, a questionnaire was sent to the medical directors of 7 of the major national and international airlines in order to receive information on their policies. The resulting recommendations are discussed with regard to: the duty of the airlines, acceptability of passengers, attendants, medication, protocol for arranging air travel, and travel to a foreign country.—P. R. Shibelski.

6647. Fries, Ingrid & Smith, Gudmund J. (Lund U., Sweden) **Influence of physiognomic stimulus properties on afterimage adaptation.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 267-271.—Compares results from a process-oriented afterimage experiment in 3 groups of 24 psychiatric patients each. The fixation stimuli were a blank oval, a sad and a happy face—1 for each group. Results show that the sad stimulus produces more distinct adaptive patterns in a sequence of repeated measurements than do the other stimuli.—*Journal abstract.*

6648. Gibbons, J. L. (U. Newcastle upon Tyne, England) **Corticosteroid metabolism in depressive illness.** *Psychiatra, Neurologia, Neurochirurgia*, 1969(Mar), Vol. 72(2), 195-199.—In depressed patients, especially those with severe endogenous depression, a modest increase in adrenocortical activity is found, with a decrease after recovery. The increase in the secretion of cortisol and corticosterone during the illness is probably a special example of the adrenocortical activation that accompanies many forms of emotional arousal in healthy Ss. Although the diurnal variation in plasma cortisol level is usually maintained in depression, it may be disrupted. Recent work also suggests that pituitary adrenal function may be less readily suppressed by dexamethasone in severely depressed patients. (17 ref.)—*Journal abstract.*

6649. Greenberg, Irwin M. (Creedmore State Hosp., Queens Village, N.Y.) **Clinical correlates of fourteen- and six-cycles-per-second positive EEG spiking and family pathology.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76, Pt. 1, 403-412.—Studied differential personality patterns in 48 psychiatric patients. 10 Ss had positive EEG spiking (PSP) and asocial family syndrome (AFS). 16 Ss had PSP and no AFS. 8 Ss had normal EEGs and AFS. 14 Ss had normal EEGs and no AFS. It was hypothesized that Ss with both PSP and AFS would show (a) more affective blunting, (b) more aggressive behavior, and (c) less clinging dependent behavior than other patients, and would have lower Comprehension and Picture Arrangement scale scores. Only the 1st and 3rd hypotheses were confirmed, thus demonstrating a CNS \times Sociofamilial interaction factor. Results point to the need to consider both CNS factors and sociofamilial factors in evaluating psychiatric patients.—*Journal abstract.*

6650. Hare, Robert D. & Thorvaldson, Sveinn A. (U. British Columbia, Vancouver, Canada) **Psychopathy and response to electrical stimulation.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 370-374.—Used a forced-choice procedure, designed to maintain arousal and to reduce the influence of boredom and inattentiveness, to determine the detection threshold

(DT) for electrical stimulation in 14 psychopaths and 28 nonpsychopaths. There were no significant differences between groups, a result that contrasts with the finding of an earlier study by R. D. Hare (see PA, Vol. 42:12400), which used a more boring and tedious procedure, that psychopaths had an unusually high DT. All groups showed the same decrease in DT when incentives (cigarettes) were used for correct detections. Results are interpreted in terms of the concept of arousal. Tolerance for shock was also determined with and without incentives. Without incentives there were no significant differences between groups, either in tolerance level or in the verbal descriptions of various intensities of shock. However, when incentives were used, psychopaths were willing to tolerate more shock than were other Ss. (30 ref.)—*Journal abstract.*

6651. Hough, Richard L. (U. Illinois) **Structural stress, anomia and psychological disorder.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 835.

6652. Israelstam, David M., et al. (U. California, Berkeley) **Abnormal methionine metabolism in schizophrenic and depressive states: A preliminary report.** *Journal of Psychiatric Research*, 1970(Feb), Vol. 7(3), 185-190.—The observed changes in the oxidative metabolism of the S-methyl carbon of methionine in a small group of patients provided direct evidence for the occurrence of altered methyl metabolism in schizophrenia.—R. V. Hamilton.

6653. Kirshner, Lewis A. & Kaplan, Norman. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Conversion as a manifestation of crisis in the life situation: A report of seven cases of ataxia and paralysis of the lower extremities.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 260-266.—Only 1 of the 7 Ss gave a history of frequent prior somatic complaints. 4 were overtly depressed. Only 1 was considered an hysterical character. Intervention was limited to dealing with the current conflict out of which the symptom grew. 4 Ss made a rapid complete recovery, and 1 improved minimally. It is felt that each case represents a reaction to a crisis in the life situation.—*Journal summary.*

6654. Kostandov, E. A. (Central Research Inst. of Forensic Psychiatry, Moscow, USSR) **Vliyaniye émo-tsional'nogo vzbuzhdeniya na porogi obnaruzheniya zvukovogo signala i subsenzornye reaktsii.** [Influence of emotional excitation on the thresholds of acoustic signal detection and subsensory reactions.] *Zhurnal Vyssheĭ Nervnoĭ Deyatel'nosti*, 1969, Vol. 19(3), 462-470.—22 "psychopaths and paranoically deluded individuals" (20-45 yr. old) were used to study the influence on subsensory reactions of emotional excitation which is a "source of powerful impulses" acting upon the nonspecific mechanisms of the reticular formation, and the level of activation in the cortex. In this connection the study was conducted on the effect of negative emotional reactions on thresholds of acoustic signal detection, and the range of the subsensory zone. The thresholds of acoustic signal detection (white noise) of various duration (from 1 msec.) were determined by the "method of minimal changes." Bioelectrical and autonomic components of the orienting reflex served as indicators of the subsensory reactions. Emotional reactions were elicited by the presentation of single words, relating to conflictful life situations, or by bright flashes of light. Reactions to "neutral" words were extinguished

in advance. Against the background of negative emotional reactions, elicited by photostimulation or by "emotional" words, the threshold of acoustic signal detection in some cases was decreased; in others increased. In cases of increase in threshold of acoustic signal detection, the number of subsensory reactions was increased.—I. D. London.

6655. Krakowski, Adam J. (Champlain Valley Physicians Hosp. Medical Center, Plattsburgh, N.Y.) **Depressive reactions of childhood and adolescence.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 429-433.—Discusses nonpsychotic depression in children, observing that it is as common in this age group as in adults. The symptoms may be secondary to other psychogenic or organic illnesses. Manifestations of depression vary with the child's age, and increased motor activity typically accompanies the depressive mood except in infancy. Depression is defined as both an illness and a feeling "caused by a loss, true or imaginary, or even by a failure to achieve a desired goal." The child's emotional defenses against this loss show a variety of behaviors including irritability, hyperactivity, aggressive behavior, or tendencies toward isolation and apathy. Characteristic manifestations of depression in infancy, childhood, and adolescence are reviewed. Various treatment procedures are discussed in light of problems, i.e., denial by the child and ambivalence on the part of the parents. The need for effective psychotherapy with the child (including a satisfactory transference relationship) and concurrent parental guidance or therapy (preferably by another member of the clinic team) is felt to be imperative for effective treatment efforts. (21 ref.)—P. McMillan.

6656. Lăpușan, I., Meiu, Gh., Cortez, P., & Seclureașu, F. **Metodologia de cercetare a morbidității și unele aspecte ale eficienței dispensarizării bolilor psihice.** [Methodology of investigation of morbidity from psychical diseases and certain aspects in the outpatient care of such cases.] *Neurologia, Psihiatria, Neurochirurgia*, 1969(Jan), Vol. 14(1), 33-40.—Describes a method of outpatient care used in the university centers of Bucharest, Timișoara, Cluj, Iași, and Tirgu-Mureș since 1965. Results obtained with mental patients (2180 adults and 2217 children) are discussed. Outpatient units treated all cases of psychosis in adults, and psychosis, neurosis, epilepsy, encephalopathy, oligophrenia, behavior disturbances, and other psychopathic states in children. Particular attention was paid to prophylaxis and the detection of mental patients, and to the organization of psycho-medico-social assistance, which increases the efficiency of the ambulatory and hospital units. This resulted in decreasing the number of admissions and duration of hospitalization, and in sociooccupational rehabilitation of the patients. (French & German summaries) (25 ref.)—*English summary.*

6657. Marshall, Myron H., Neumann, Charles P., & Robinson, Milton. (Silver Hill Foundation, New Canaan, Conn.) **Lithium, creativity, and manic-depressive illness: Review and prospectus.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 406-408.—Discusses the nature of the connection between creativity and certain forms of mental illness. Cases are cited in which high levels of creativity exist during the manic phases of persons diagnosed as manic depressive, in contrast to their lack of productivity in depressed periods. It is postulated that by determining the qualitative level of creativity in

manic-depressives and then administering lithium, controlled data will be produced "that can show the relationship between creativity and the manic phase of this illness." A major problem in studying this relationship is the lack of instruments designed to rate the creative process. Such a scale is being designed that will test patients before and after lithium treatment "to validate the hypothesis that lithium alters creativity." 3 illustrative case histories are included. (18 ref.)—P. McMillan.

6658. Mayo, Clara & Havelock, Ronald G. (Boston U.) **Attitudes toward mental illness among mental hospital personnel and patients.** *Journal of Psychiatric Research*, 1970(Jul), Vol. 7(4), 291-298.—The main attitudinal component identified among 62 psychiatric ward staff members and 89 hospitalized psychoneurotic patients is termed general authoritarianism and yields factor loadings for patients and staff strikingly similar in magnitude and configuration and opposite in direction. Other staff factors describe different aspects of professional roles. Patient factors show the predominance of low self-esteem, passive compliance, and a physical orientation toward the patient's own mental illness.—R. V. Hamilton.

6659. Meltzer, Herbert. (National Inst. of Mental Health, Chevy Chase, Md.) **Increased activity of creatine phosphokinase and aldolase activity in the acute psychoses: Case reports.** *Journal of Psychiatric Research*, 1970(Jul), Vol. 7(4), 249-262.—The increase in serum enzyme activity in an acute manic-depressive patient and in an acute schizophrenic patient were significantly correlated with clinical course, occurring at times of severe stress which preceded or coincided with psychotic behavior. The type of creatine phosphokinase and aldolase present was the muscle type. The increased enzyme activity is discussed as a manifestation of subtle myopathic changes in acutely psychotic patients. (48 ref.)—R. V. Hamilton.

6660. Miller, Louis. **The Israel Mental Treatment Act (1955): Civil commitment of the mentally ill in Israel.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 109-117.—Discusses the laws established to regulate "the treatment and status of the mental disordered in Israel," focusing on the definitions, modes of admission, and procedures for discharge.—G. Steele.

6661. Olson, John T. & Smith, David H. (Camarillo State Hosp., Calif.) **Leadership roles in a psychiatrically deviant adolescent collectivity.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 499-510.—Used sociometric and staff rating data from a sample of 33 female adolescent inpatients on a psychiatric ward, to test 2 general hypotheses regarding leadership, based on prior results for normal populations. The 1st hypothesis stated that leader roles in the present collectivity would be clearly differentiated in terms of an instrumental vs. expressive dimension and a reputed vs. actual dimension. Results did not confirm this, showing instead significant and strong correlations among the several sociometric measures of leadership roles. The 2nd hypothesis stated that leaders in the present collectivity would tend to be higher in age and other traits socially desirable in the society at large. This hypothesis was confirmed, indicating a substantial similarity between the nature of leadership in a psychiatrically deviant collectivity and other normal collectivities. A major departure from prior

results in normal collectivities was the fact that ratings of asocial aggression were independent of leadership nominations, interpreted as indicating a high tolerance for interpersonal deviance in this psychiatrically deviant collectivity.—*Journal abstract.*

6662. Paul, Michael L., Ditzion, Bruce R., Pauk, George L., & Janowsky, David S. (National Heart Inst., Lab of Chemical Pharmacology, Bethesda, Md.) **Urinary adenosine 3',5'-monophosphate excretion in affective disorders.** *American Journal of Psychiatry*, 1970(Apr), Vol. 126(10), 1493-1497.—Studied 8 male and 29 female psychiatric inpatients with affective disorders on a research metabolic ward at the National Institute of Mental Health in order to ascertain any relations between affective disorders and adenosine 3',5'-monophosphate (cyclic AMP) concentration and levels. Ss were divided into 4 groups: (a) manic, (b) neurotic depression, (c) psychotic depression, and (d) normal (10 female volunteers). Urine samples were collected from all 4 groups every 24 hr. and results show that while the differences in urine volumes between normals, moderately and severely depressed patients were not significant, manic patients' volumes were elevated. Urinary cyclic AMP concentration was similar in both the manic and normal groups. The differences found in cyclic AMP excretion between categories of affective disorders is a new finding, which seems to imply the possibility that "cyclic AMP may be important in the chain of events leading to aberrant mental states." (22 ref.)—P. R. Shibleski.

6663. Pokorny, Alex D. & Overall, John E. (Baylor U., Coll. of Medicine, Houston, Tex.) **Relationships of psychopathology to age, sex, ethnicity, education and marital status in state hospital patients.** *Journal of Psychiatric Research*, 1970(Feb), Vol. 7(3), 143-152.—A factor analysis of psychiatric rating scale results from 1500 Ss in relation to 6 background variables including age, sex, race-ethnicity, marital status, divorce history, and educational achievement indicated that the nature of manifest psychopathology was related to a variety of these background variables, both those which are not susceptible to influence by psychopathology, e.g., age, race, sex, and those which might conceivably be influenced by the psychiatric disorder, e.g., marital status. It is concluded that such background variables should be taken into consideration in both research and clinical practice as a basis for interpreting the significance of psychiatric symptom patterns.—R. V. Hamilton.

6664. Rorsman, Brigitta. (U. Lund, Psychiatric Research Center, Sweden) **Disability of psychiatric patients.** *Social Psychiatry*, 1970(Oct), Vol. 5(4), 219-223.—Using local National Health Insurance records, the amount of sickness benefit given to 74 male and 120 female patients treated at a department of psychiatry was studied for a 4-yr period. Records of controls were obtained from the same source and matched for sex, age, and domicile. Data indicate that disability pension was granted to 9 men and 15 women in the patient group and to 4 men and 1 woman in the control group. The average number of sickness benefit days/year was 4.9 times larger for male Ss and 3.4 times larger for female Ss than for controls. The higher sickness reporting in men was due to both psychiatric and physical illness. In women, only psychiatric illness was significantly higher. (French & German abstracts)—*Journal abstract.*

6665. Saavedra, Victor. **El desarrollo psíquico**

anormal: Revisión crítica y consideraciones nosográficas. [Abnormal psychological development: Critical revision and nosographic considerations.] *Revista de Neuro-Psiquiatría*, 1969(Jun), Vol. 32(2), 85-92.

—Presents theoretical considerations on abnormal psychological development, reviewing literature on somatic and psychoanalytic origins of mental illness. It is affirmed that abnormal psychological development occurs in certain personality types, with discussions on the connections between personal disposition and environment in relation to characterological theory. The problem of the nosographic ubiquity of abnormal psychological development is considered. (English, French, & German summaries) *P. Hertzberg.*

6666. **Saavedra, Victor. El syndrome de Cotard: Consideraciones psicopatológicas y nosográficas.** [The Cotard syndrome: Psychopathological and nosographic considerations.] *Revista de Neuro-Psiquiatría*, 1968(Sept), Vol. 31(3), 145-174.—Presents case histories of 8 female and 2 male 28-81 yr. old Ss which illustrate discussions of the pathogenesis, nosography, and clinical configuration of the Cotard syndrome. Cotard's concepts of negation and delirium which characterize the syndrome are discussed with references to research since his original theses. The characteristic melancholy and lapses of consciousness having varied lengths of time led to the term "nihilist delusion" to describe the syndrome. Clinical distinctions are made between the symptomatology of melancholia, mixed psychosis, and schizophrenia in regard to the Cotard syndrome. A pseudo-Cotard syndrome is described in schizophrenia. A discussion of alterations of the perception of subjective time is offered with philosophical references. (26 ref.) (English, French, & German summaries)—*P. Hertzberg.*

6667. **Saenger, Gerhart.** (Dept. of Mental Hygiene, Albany, N.Y.) **Factors in recovery of untreated psychiatric patients.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 13-25.—Studied 305 Ss who had applied for, but not entered, outpatient psychiatric treatment. Data about patient characteristics were collected independently at intake and follow-up via a checklist describing areas of psychopathology, functioning, ability to care for home and children, marital emotional-supporting role, employment status and work performance, and social adjustment. Follow-up was obtained through home interviews. 61% of all untreated cases of selected symptoms of schizophrenia and depression were improved. New symptoms were found in untreated depression twice as often as in schizophrenia. Among Ss showing improvement in psychopathologic symptoms, 69% improved in marital functioning. Degree of education was a strong influence on improvement, with Ss having a college education showing the greatest change in functioning, vocational adjustment, and self-esteem. Married Ss improved more often than unmarried, particularly those with depressive symptoms. Ss living alone experienced a reduction in schizophrenic symptoms (71%). Improvement in all Ss was strongly linked to the acknowledgement of their own contribution to their difficulties. (23 ref.)—*M. West.*

6668. **Schneck, Jerome M.** (26 W. 9th St., New York, N.Y.) **Pseudo-malingering and Leonid Andreyev's "The Dilemma."** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 49-54.—Pseudomalingers deliberately feign psychological illness and discover later that they actually had unconsciously been suffering the distress they

believed they were falsifying. This misrepresentation to the self and to others is necessary for these people to maintain ego integrity. Pseudomalingering is a measure that satisfies a need to maintain intact a self-image that would be marred by acknowledging psychological problems which cannot be consciously mastered. This form of deception is a temporary ego supporting device. It is an odd denial of illness through claims of illness. The chief character in Andreyev's story is a pseudomalingering.—*D. Prager.*

6669. **Skea, Susan; Draguns, Juris G., & Phillips, Leslie.** (U. Dundee, Scotland) **Ethnic characteristics of psychiatric symptomatology within and across regional groupings: A study of an Israeli child guidance clinic population.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 31-42.—Compared discrete manifestations and inclusive categories of symptomatology between socioeconomically and educationally matched groups of boys of Iraqi, Yemenite, German, and Polish parentage in a child guidance clinic. Attempts were also made to compare smaller, unmatched groups of girls. Results reveal differences in psychopathological expression among all the groups. Middle Eastern boys tended toward overtly expressed maladaptive and aggressive behavior, while ideational and self-directed symptomatology predominated among the European boys. Within each of the 2 regions, boys of Iraqi parentage differed from Yemenites in more direct and explicit expression of aggression and boys of Polish extraction exceeded those of German background in avoidance of, and withdrawal from, social contact. Results obtained with girls were not parallel to those observed in boys and need fuller investigation. (31 ref.)—*Journal abstract.*

6670. **Smith, David H. & Olson, John T.** (Boston Coll., Inst. of Human Sciences) **Sociometric status in a psychiatrically deviant adolescent collectivity.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 483-497.—Using sociometric peer ratings, staff ratings, and hospital records, a study was made of a hospital residential ward of 33 adolescent girls. The sociometric structure of the collectivity involved 3 types of individuals: Ss high on positive sociometric status measures (association, popularity), Ss high on negative sociometric status measures (avoidance, reputed power), and Ss low on both positive and negative sociometric status measures. Positive and negative sociometric status, therefore, appeared to be independent qualities for Ss rather than having a strong negative association. High positive sociometric status was significantly correlated in a positive direction with higher psychiatric health, heterosexual interest, and social initiative. Being younger and/or more asocially aggressive was significantly associated with high reputed power, which in turn was significantly correlated with high avoidance status. Ss low in both positive and negative sociometric status tended to be low on all of the other variables noted. (20 ref.)—*Journal abstract.*

6671. **Solomon, George F., Rubbo, Sydney D., & Batchelder, Elaine.** (Veterans Administration Hosp., Palo Alto, Calif.) **Secondary immune response to tetanus toxoid in psychiatric patients.** *Journal of Psychiatric Research*, 1970(Feb), Vol. 7(3), 201-207.—When administered tetanus toxoid, 13 schizophrenic patients did not differ in their secondary immunologic responses from 6 normal controls or from normals reported by others, but the 13 nonschizophrenic patients showed a somewhat

impaired immunologic response not reaching statistical significance. Phenothiazine drugs showed no effect on antibody response. (26 ref.)—R. V. Hamilton.

6672. Steiner, Jacob E., Rosenthal-Zifroni, Anath, & Edelstein, Ekiezer L. (Hebrew U., Hadassah School of Dental Medicine, Jerusalem, Israel) **Taste perception in depressive illness.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 223-232.—Tested 21 depressive and 18 nondepressive hospitalized psychiatric patients to quantify disturbances in perception of the 4 basic taste modalities: sweet, salty, sour, and bitter. It was hypothesized that measurable function-disturbances would exist. The function of the sense of taste was expressed both in the determination of the discrimination-threshold and by the quantitative indication of the incidence of errors in each of the 4 basic taste modalities. Simultaneously, the state of depression of each S was rated by means of the Hamilton score. Comparison of results obtained from 3 critical phases of hospitalization and from statistical evaluation of findings show that: (a) depressed Ss have a higher threshold for all the basic taste modalities than the nondepressed; (b) there is significantly higher incidence of inconsistency in the recognition of the stimuli in depressive Ss; (c) there is positive correlation between the typical symptoms of depression and findings regarding the function of the sense of taste; and (d) there is close correlation between recovery from depression and the restitution of the functioning of taste. The possible mechanisms involved in these phenomena are discussed. (23 ref.)—*Journal abstract*.

6673. Taintor, Zebulon. (State U. New York, Medical School, Buffalo) **Birth order and psychiatric problems in boot camp.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1604-1610.—Studied 323 male naval recruits from October 1966 to December 1967. Ss were seen by the psychiatrist. The initial hypothesis was that individuals who were younger siblings were more likely to be found unfit for military service than older siblings because of personality disorders. Ss were interviewed, their various disorders diagnosed, and the data obtained (including parental relationships and social class) classified. Results show 5.7% psychotic, 27.2% psychoneurotic, 42.7% personality disorders, 14.8% psychophysiological disorders, and 9.6% other disorders. Only children were most often found to consult the psychiatrist, to be diagnosed as psychoneurotic, and to be discharged from the service. 1st-borns were almost equally divided between psychoneurotic and those with personality disorders (34-35%) and were more often retained than discharged from the service. Other Ss were less often diagnosed as psychoneurotic; usually being diagnosed as having personality disorders. (31 ref.)—P. R. Shibelski.

6674. Zentner, Ervin B. & Aponte, Harry J. (1514 Oakley, Topeka, Kan.) **The amorphous family nexus.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 91-113.—Describes the individuals in this type of family as being in extreme adhesion and interdependence. They are poorly differentiated from each other and introject the family en masse which then becomes a primary source of identity for them. There is an amorphous quality to the individuals within this family unit. They find all their gratification within the family circle. They supplement the functioning of each other and resist the emotional separation of any member of the family group. This is the amorphous family nexus. These family

members do not strongly cathect the therapist except as he might be taken into the family nexus. There is a need for metapsychology that will encompass both individual and family theory. (35 ref.)—D. Prager.

Neurosis & Emotional Disorder

6675. Adams, Walter D. (Utah State U.) **Survival training: Its effect on the self concept and selected personality factors of emotionally disturbed adolescents.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 388.

6676. Becker, Peter. **Investigación psicoanalítica de gemelos con neurosis.** [Psychoanalytic investigation of twins with neurosis.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1970(Jan), No. 14, 17-22.—Discusses the significance of heredity and environment in the development of neurosis with reference to studies conducted on homozygotic twins (HO), heterozygotic twins of the same sex (HE), and twins of different sexes (D). Comparisons of neurotic twins indicated that heredity influences symptomatic differences. The psychological implications of the twin relationships particular to HO's were examined because their intimacy seems to have a polarizing influence which is indicative of the nature of neurosis, i.e., integration vs. disintegration. In this relation, 1 twin is usually dominant and, in most cases, less neurotic. The influence of harmony or disharmony in the twin relationship is stressed.—P. Hertzberg.

6677. Claghorn, James. (Baylor U., Medical School) **The anxiety-depression syndrome.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 438-441.—Examines the concepts of anxiety and depression to determine the extent to which they may be relatively independent or unitary. 2 studies using psychoneurotic patients are described including (a) a comparison of the Depression and Taylor Anxiety MMPI scales on 100 outpatients in a general psychiatric clinic, and (b) an analysis of the recent literature on the relative reported effectiveness of psychotropic drugs for the treatment of anxiety and depression. Results of the 1st study indicate that anxiety and depression were significantly correlated. In the 2nd study, literature findings also suggest that "drug effectiveness is equally apparent on anxiety and depression regardless of the class of drug, supporting the concept that these are unitary and not separate symptoms." It is concluded that the term "anxiety depression syndrome" should replace the 2 terms anxiety neurosis and depressive neurosis in psychiatric nomenclature. A schema is presented to depict the "anxiety-depression syndrome," indicating preferred drug treatments depending on severity of symptoms and relative amounts of anxiety and depression. (16 ref.)—P. McMillan.

6678. Dorfman, Wilfred. (Brunswick Hosp. Center, Amityville, N.Y.) **The recognition and management of depression.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 416-419.—Discusses the high number of successful suicides in the United States (at least 20,000 each yr.), emphasizing the need to recognize and properly manage cases of acute depression. Different subtypes of depression are reviewed, including neurotic, senile, schizoaffective, and depressive equivalents. The depression that accompanies or follows various organic illnesses is also discussed. Biochemical and psychodynamic factors in depression are reviewed. Current treatments of

depression include psychotherapy, ECT, and a variety of antidepressant and anxiolytic agents.—*P. McMillan.*

6679. **Dunlop, Edwin.** (Fuller Memorial Sanitarium, Attleboro, Mass.) **Clinical and biochemical aspects of depression.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 422-425.—Discusses the mounting evidence of the role of neurochemical and endocrine factors in depression and its treatment. It has been hypothesized that the newer antidepressant drugs act by altering the metabolism of norepinephrine in the brain. 2 of these drugs, imipramine and amitriptyline, which are tricyclics, are described in detail, including dosages, mode of administration, and recommended treatment regimen. It is concluded that for optimal results there must be a careful patterning of drugs, singly or in combination, with each patient according to his diagnostic condition.—*P. McMillan.*

6680. **Faas, Larry A. (Ed.)** (Arizona State U.) **The emotionally disturbed child: A book of readings.** Springfield, Ill.: Charles C Thomas, 1970. xiv, 386 p. \$14.50.

6681. **Façon, E., Pruskauer-Apostol, Beatrice, & Alecu, C.** **Tulburări nevrotice de tip astenodepresiv în cadrul spondilartrozei cervicale.** [Neurotic disturbances of the asthenodepressive type in cervical spondylarthrosis.] *Neurologia, Psihiatria, Neurochirurgia*, 1969(Jan), Vol. 14(1), 51-54.—Studied 255 patients suffering from asthenic neurosis with depressive elements, admitted to the neurologic division of a Bucharest hospital. The importance of conflictual factors and strain in inducing this type of neurosis is shown. However, in 94 cases of cervical spondylosis, a direct relationship appeared to exist between the distal cerebral circulation perturbations brought about by cervical spondylosis and neurotic disturbances of the asthenodepressive type caused by these perturbations. (French, Russian, & German summaries) (20 ref.)—*English summary.*

6682. **Foulkes, David; Larson, James D., Swanson, Ethel M., & Rardin, Max.** (U. Wyoming) **Two studies of childhood dreaming.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 627-643.—Employed the technique of dream retrieval by nocturnal awakening during periods of REM sleep. Ss were 12 preschoolers and both 7 normal and 7 emotionally disturbed male adolescents. Dreams of Ss at both ages were generally directly related to their waking lives, but personality pathology was associated with more vivid and unrealistic dreaming. (30 ref.)—*Journal abstract.*

6683. **Frankel, A. Steven.** (U. Southern California) **Treatment of a multisymptomatic phobic by a self-directed, self-reinforced imagery technique: A case study.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 496-499.—Reports the treatment of a 24-yr-old woman with disabling fears of earthquakes, sexuality, and enclosed places. The treatment was a self-administered variation of implosive therapy in which the client was encouraged to imagine herself experiencing sequences of images involving her fears. The imagery sequences ended only when she imagined the feared experience terminating. A 6-mo follow-up found her functioning without any of the fears she reported in treatment and without the occurrence of any new fears.—*Journal abstract.*

6684. **González de Chávez, Manuel; Orbe Garay, María I., & Rodríguez Gorostiza, María I.** **Resultados del Test de Rorschach en eritrofobicos.** [Results of Rorschach test in patients with eritrophobia.] *Actas Luso-Españolas de Neurologia y Psiquiatria*, 1968(Sep).

Vol. 27(4), 525-532.—Studied 10 female and 23 male eritrophobics (17-53 yr. old) on the basis of Rorschach protocols. Certain special phenomena were noticed: (a) initial crash, characterized by anatomical and monochromatic replies, self-criticisms and reaffirming questions, increase in RT, or reduction of the number of replies; (b) red crash, a continuation of all the above protocols with compensation mechanism in each case; (c) grey crash, characterized by expressions of symmetry; (d) color crash; and (e) crash to Plates VI and VII. Frequent self-criticism was found. Analysis of protocols revealed that Ss could be classified into 2 groups those with strong inhibition, and those with anancastic traits which approximated obsessives. (English summary)—*P. Hertzberg.*

6685. **Hoffmann, Helmut & Peterson, David.** (Minnesota State Hosp., Willmar) **Analysis of moods in personality disorders.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 187-190.—95 psychiatric inpatients with the diagnosis of personality disorder and a history of acting-out behavior were rated by 3 Os on 52 mood items. A factor analysis resulted in 10 factors, 8 of which were interpreted as friendliness—hostility, guilt, activity, fatigue, efficiency, depression, confusion, tension-anxiety. When these O ratings were compared with self-ratings most differences appeared on the 1st factor, which suggests the presence of a social desirability response set. Contrary to popular conceptions of personality disorders a population with this diagnosis was rated high on friendliness and relatively low on hostility. However, absence of guilt was confirmed.—*Journal abstract.*

6686. **Knoff, William F. & Cooke, Edwin T.** (State U. New York, Upstate Medical Center, Syracuse) **A history of the concept of neurosis, with a memoir of William Cullen.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 80-84.—In the continuing effort to translate clinical observations into more accurate nosological metaphors, the term neurosis has been remarkably long-lived. An explanation for its durability in tracing the historical vicissitudes of its use, from William Cullen, who introduced it, to Freud and the 20th-century is presented. (17 ref.)—*Journal abstract.*

6687. **Lukianowicz, N.** (Child Guidance & Family Guidance Clinic, Whiteabbey Hosp., Antrim, Ireland) **Hallucinations in non-psychotic children.** *Psychiatria Clinica*, 1969, Vol. 2(6), 321-337.—Reviews the pertinent literature and describes 14 cases of hallucinations in children. The personality of parents, their religion, their socioeconomic status, the size of the family, the number and the age of the siblings, and the place of the S in the family were considered. The influence of the school, in particular the role of teachers and schoolmates, are discussed. The symptoms presented by Ss are briefly reported, and the official reason for the referral is compared with the real problem in each case. The IQ, personality of the child, and his relationship with various members of the family are discussed. Conclusions regarding the incidence, psychodynamics, and significance of hallucinations in nonpsychotic children were drawn. The treatment and some preventive measures are indicated. (28 ref.)—*Journal summary.*

6688. **Masserman, Jules H.** (Northwestern U.) **Is uncertainty a key to neurogenesis?** *Psychosomatics*, 1970(Sep), Vol. 11(5), 391-402.—The neurogenesis hypothesis states that "when physical inadequacies, environmental stresses or motivational conflicts exceed an organism's innate or acquired capacities for adap-

tation, internal tensions (anxiety) mount, neurophysiologic (psychosomatic) dysfunctions occur, and the organism develops over-generalized patterns of avoidance (phobias), stereotyped behavior (obsessions and compulsions), aberrant conspecific and extraspecific transactions (social deviations) and regressive, hyperactive or hostile, or bizarrely 'derealistic' (hallucinatory, delusional) responses analogous to those in human neuroses and psychoses." Uncertainty arises when the organism senses an inability to predict and control events important to its welfare. References ranging from classical mythology and literature to contemporary research findings with animals and men are cited in support of the hypothesis. Applications of this biodynamic orientation to clinical psychotherapy are presented. It is concluded that the essence of therapy is to assist troubled people in rebuilding confidence in themselves, and in their religious, social, and "scientific" systems.—P. McMillan.

6689. McLaughlin, Blaine E. (U. North Dakota, Medical School) **Recognition and treatment of youthful depression in a rural area.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 420-421.—Describes types of depressive reactions encountered among college students in the rural part of the great plains area. It is noted that many students come from rigid, highly religious family backgrounds and are unprepared for the new experiences of university life. They react with displays of aggressiveness and confrontation with authority. This apparent behavior disorder covers a basic depression that responds well to mild anti-anxiety and antidepressive drugs and to standard nondirective interview techniques in weekly visits over a 1-3 mo. period.—P. McMillan.

6690. Muñoz Bautista, César. **Enuresis: Correlato clínico-electroencefalográfico.** [Enuresis: Clinical-electroencephalographic correlation.] *Revista de Neuro-Psiquiatria*, 1968(Dec), Vol. 31(4), 277-289.—Reviews diverse literature on enuresis regarding the etiology and psychology of the enuretic. Observations gained from psychiatric consultations with 83 male and 27 female enuretics led to the conclusion that enuresis has a polymorphous symptomatology, predominated by behavioral disorders. A similarity is noted among character traits existing between enuretic, epileptic, and sociopathic children. The enuretic child is considered to be affected by profound psychopathological alterations which can be helped by a broad diagnostic process. In more than 90 of the cases, material gained through personal, familial, and EEG examinations indicate that primary enuresis has an organic cerebral basis. (English, French, & German summaries) (19 ref.)—P. Hertzberg.

6691. Pitts, Ferris N. (Washington U., Medical School) **The biochemistry of anxiety.** *Scientific American*, 1969(Feb), Vol. 220(2), 69-75.—Reports studies concerning the role of excessive amounts of lactate in the production of anxiety symptoms and attacks. Former studies have indicated that blood lactate in anxiety neurosis patients shows significantly higher amounts than in normal controls. In a double-blind experiment, 14 anxiety neurotics and 10 normal (nonpatient) controls were given infusions of either sodium lactate, sodium lactate with calcium or glucose in sodium chloride. Results show that patients given lactate alone reliably experienced anxiety attacks. When calcium was added, however, they had fewer symptoms and almost no symptoms appeared when they were given glucose in saline solution. Controls had fewer and less severe symptoms in response to lactate but showed similar

response patterns to lactate with calcium and to glucose. It is concluded that "a high concentration of lactate ion can produce some anxiety symptoms in almost anyone ... and that calcium ion largely prevents the symptoms."—P. McMillan.

6692. Sabakian, William S. (Suffolk U., England) **A social learning theory of obsessional neurosis.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Apr), Vol. 7(1), 70-75.—Explains the obsessional neurosis from a base established by social learning theory, humanistic psychology, and ontanalytic or existential psychology. Man through social learning can develop obsessional behavior characteristics, therefore, logotherapeutic techniques of paradoxical intention and dereflection succeed in obsessional cases because the conditioning process is being reversed and the S is undergoing experimental extinction. (35 ref.)—*Journal abstract*.

6693. Sloane, R. B., Staples, F. R., & Payne, R. W. (Temple U., Medical School) **Response to social and monetary reward in neurosis.** *Journal of Psychiatric Research*, 1970(Jul), Vol. 7(4), 227-236.—Behavior-disordered Ss (neurotic patients defined by a history of antisocial illegal activities) were more responsive to positive reinforcement in the form of verbal approval and modified their behavior to obtain approval to a greater extent than the other groups of dysthmic Ss (neurotic patients with no history of antisocial illegal activities) and normal Ss (nonpatient volunteers). Behavior-disordered Ss were more persistent in responding to the monetary reward situation, although the normals were more successful in terms of total amount of money obtained. It is suggested that the interaction of the personality characteristics of the Ss with the sex and status of the E may be critical in determining responsiveness. Behavior-disordered Ss are likely to be more responsive to peers and to those of the opposite sex, and dysthmics Ss to those of higher status.—R. V. Hamilton.

6694. Takahashi, R., et al. (U. Tokyo, Medical School, Japan) **Tyrosine metabolism in manic depressive illness.** *Life Sciences*, 1968(Nov), Vol. 7(22, Pt. 2), 1219-1231.—To further examine the catecholamine theory of manic-depressive illness tyrosine metabolism in manic-depressive patients was studied in that the conversion from tyrosine to dihydroxyphenylalanine (Dopa) might be disturbed in those with the illness. Tyrosine levels in fasting plasma and in every 4 hr. following an oral load of tyrosine were studied in 5 male and 13 female patients with endogenous depression or mania. Fasting levels of tyrosine were not significantly different in normals or for either depressive or manic patients. Plasma levels after oral loads of tyrosine were not significantly different between manic and depressive patients. However, depressive patients had higher increases in plasma tyrosine levels than did normal Ss at 1-4 hr. after ingestion. There was no correlation between results of a tyrosine tolerance test and the course of depression. Tyrosine levels in the urine were almost equal for both patients and normal Ss. The present data suggest that an altered tyrosine tolerance is a characteristic feature of the manic-depressive illness without regard to moods. It is likely that there would be a decrease in tyrosine transaminase activity in both depressive and manic patients and that there may be an alteration in the pathway of tyrosine metabolism in the manic-depressive patients. (15 ref.)—W. E. Wood.

6695. Von Müller, I. (Humboldt U., Berlin, E. Germany) **Psychiatrische Auffassungen zum Wesen**

der Zwangsnervose mit therapeutischen Konsequenzen. [Psychiatric notions of the nature of obsessional neurosis and their related therapies.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Jun), Vol. 22(6), 201-208.—The ambiguous etiology of obsessional neuroses is reviewed by references to related literature. Earlier psychological explanations have proliferated into physiological and more recently anthropological ones. Therapy appropriate to the respective theoretical bases is described. (41 ref.)—K. J. Hartman.

6696. Winokur, George & Reich, Theodore. (Washington U., Medical School) **Two genetic factors in manic-depressive disease.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 93-99.—In the families of 61 manics there were more affectively ill maternal relatives than paternal relatives. This suggests that an X-linked dominant gene is implicated in the transmission of manic depressive disease. The X-linked dominant factor may be the disease factor itself. A number of affectively ill family members of manics suffer from depression only. A 2nd genetic factor may be responsible for the presence of mania. Alcoholism, frequently seen in these families, may be 1 of the ways in which this 2nd genetic factor expresses itself.—D. Prager.

6697. Zung, William W. (Duke U., Medical School) **The pharmacology of disturbed sleep.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 470-472.—Describes the laboratory characteristics of sleep (using the 6 EEG sleep stages, A, 1, 2, 3, 4, and REM) in persons complaining of anxiety and depression. The effects of drugs on sleep as reflected in these stages are summarized for the barbiturates, meprobamate and the tricyclic antidepressants. In cases using antidepressant drugs or in nondrug-related wakefulness, it is concluded that there is an altered sleep-arousal mechanism which decreases the number and duration of the REM phenomena. (24 ref.)—P. McMillan.

Psychosis

6698. Gulyamov, M. G. & Rakhminov, B. Ya. (Abuash Ibni Sino Medical Inst., Tadzhikistan, USSR) **K voprosu ob ostrom alkogol'nom gallyutsionoze, protekayushchem s bredom revnosti.** [On acute alcoholic hallucination, proceeding with delusional jealousy.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Jan), Vol. 70(1), 97-101.—Presents a study based on 18 cases of acute alcoholic hallucinosis accompanied by delusional ideas of jealousy, drawing their content from auditory hallucinations of erotic character. The psychosis was transient, and complete recovery occurred.—I. D. London.

6699. Morozov, L. T. (Research Inst. of Neurology & Psychiatry, Kharkov, USSR) **K voprosu o regulatsii urovnya sakhara i arteriovenoznoi raznitsy v ego soderzhanii pri glipertimicheskikh sostoyaniyakh tsirkulyarnogo i shizofrennogo geneza.** [On the regulation of sugar level and of arteriovenous difference in this level in hyperthymic states of circular and schizophrenic genesis.] *Zhurnal Nevropatologii i Psikhatrii*, 1970, Vol. 70(3), 394-399.—35 manic-depressives and 47 schizophrenics served as Ss. Irrespective of nosological differences, a correlation existed between arterial glycemia and the arteriovenous difference. The correlational connection was higher, the greater the salience acuity, and intensity of the affective disorders. (English summary)—I. D. London.

6700. Plutchik, R., Platman, S. R., & Fieve, R. R. (Columbia U.) **Self-concepts associated with mania and depression.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 399-405.—14 manic-depressive patients, 16 staff, and 52 undergraduates described their normal self, their ideal self, and their least-liked self in terms of certain personality traits. The emotion profile for the depressed state correlated highly with the least-liked self, but the manic profile did not correlate with any other description. Data suggest that ideal-self studies are basically concerned with social stereotypes.—*Journal abstract.*

6701. Pohlen, Manfred. **Una psicosis familiar: Análisis estructural de interrelaciones familiares.** [A familial psychosis: Structural analysis of familial interrelations.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1969, No. 11, 69-88.—Discusses the psychodynamics of the interpersonal relations between a catatonic female and her family from material gathered in 5 yr. of analysis. A ternary cycle of symbiosis between mother, child, and father is examined regarding psychoanalytic interpretation of objectal relations. A polarization of objectal relations between omnipotence and impotence is shown to create a condition of mutual contradiction in the family. Theories of dominance and dependence are discussed to show the emergence of an assassin-suicide theme in the inherent dialect of the family. (24 ref.)—P. Hertzberg.

6702. Yaryura-Tobias, Jose A., Diamond, Bruce; Wolpert, Arthur, & Merlis, Sidney. (Central Islip State Hosp., N.Y.) **The variables of silent myocardial infarction in a psychotic population.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 483-487.—Investigated whether the cause of silent myocardial infarction in psychotics might be due to (a) differences in pain thresholds, (b) analgesic actions of phenothiazines, (c) poor verbal communication, or (d) a combination of these. The study was prompted by the high prevalence (2.6%) of previously undiagnosed myocardial infarction discovered in psychiatric patients through EKG tracings and the subsequent retrospective reviews of their case histories. 12 psychotics with silent myocardial infarction, 13 psychotics without infarction, and 13 normal controls were administered a verbal pain threshold test and a word association test on 2 occasions. For the psychotics, the tests were administered 1st with medication and then without. Results show that (a) normals and paranoids tend to have a low verbal pain threshold (VPT); (b) psychotics with myocardial infarctions, hebephrenics, and catatonics tend to have a high VPT; and (c) psychotics without infarctions and psychotics due to alcohol have varying VPT scores. Phenothiazine medication tends to inhibit the infarction group's ability to communicate. It is suggested that EKG tracings should constitute part of the periodic tests administered to chronic schizophrenics who are on phenothiazine treatment.—P. McMillan.

Schizophrenia

6703. Ax, Albert F. & Bamford, Jacqueline L. (Lafayette Clinic, Psychophysiology Div., Detroit, Mich.) **The GSR recovery limb in chronic schizophrenia.** *Psychophysiology*, 1970(Jul), Vol. 7(1), 145-147.

6704. Bryson, Carolyn Q. (Indiana U., Medical Center, Indianapolis) **Systematic identification of perceptual disabilities in autistic children.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 239-246.—Used

matching-to-sample tasks to test the ability of 6 autistic children to make visual, vocal, and fine motor responses in response to visual and auditory stimuli. Results indicate that: (a) the testing method was appropriate for low-functioning children; (b) the group was heterogeneous with respect to perceptual deficits, and (c) fine motor performance was poor. Data suggest that a basic difficulty in infantile autism may not be an avoidance of auditory and visual stimuli per se but rather a deficit in ability to make cross-modal associations. It is further suggested that the testing method would be useful for constructing profiles of perceptual disabilities with many types of low-functioning children.—*Journal abstract.*

6705. Calhoun, James F. (State U. New York, Stony Brook) **Effects of performance payoff and cues on recall by hospitalized schizophrenics.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 485-491.—Examined reinforcement and information-processing theories of schizophrenic deficit with respect to the effects of the treatments proposed by each theory in the modification of the performance on 5 free recall tasks. 162 male schizophrenics were tested on 3 conditions of monetary performance payoff (no payoff, proportionate payoff, nonproportionate payoff) crossed with 3 conditions of informational cues (no cues, increasing cues across tasks, all cues across tasks). Results indicate that both performance payoff and information independently significantly improved the recall performance across all Ss. Dividing Ss according to 2 dimensions (paranoid-nonparanoid, process-reactive) showed the effects of the conditions to be different for subgroups of schizophrenics: process nonparanoid schizophrenics were not significantly affected by different information conditions, and reactive paranoid schizophrenics were not significantly affected by different payoff conditions. (30 ref.)—*Journal abstract.*

6706. Cancro, Robert. (Center for Advanced Study, Urbana, Ill.) **A classificatory principle in schizophrenia.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1655-1659.—Attempts to establish reliable criteria for symptoms of schizophrenic syndromes. Based on the theory that "language normally shows differentiation over time," an Index of Formal Signs of thought disorders was the resulting system. 51 male Ss who had been admitted to a large city hospital and diagnosed as schizophrenic were used to test the index for data reliability and statistical validity. It was tested on 2 occasions by separate sets of psychiatrists, results of which demonstrated reliability to be .93 and .92. A direct and significant relationship was found between the severity of the index rating and a familial history of mental illness ($p < .05$) ($r = .24$). Although "the index is nothing more than an expression of the severity of the schizophrenic in a given case at a given time, it is a useful measurement in that it groups patients according to their premorbid adjustments and it predicts outcome."—P. R. Shibelski.

6707. Fuhrer, Marcus J. & Baer, Paul E. (Baylor U., Medical School, Houston, Tex.) **Preparatory instructions in the differential conditioning of the galvanic skin response of schizophrenics and normals.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 482-484.—Determined whether the GSR of schizophrenics can be differentially conditioned by using an RT task as the UCS in conjunction with informative instructions concerning the CS-UCS relations. 8-sec

tones of differing frequency were the CSs, and the CS-UCS interval was 8 sec. In contrast to schizophrenics previously demonstrated failure to condition without preparatory instructions, the instructed schizophrenic group ($N=20$) showed highly reliable GSR differentiation which differed in few respects from that shown by an instructed normal group ($N=20$).—*Journal abstract.*

6708. Green, Arthur H. (State U. New York, Downstate Medical Center, Brooklyn) **The effects of object loss on the body image of schizophrenic girls.** *Journal of the American Academy of Child Psychiatry*, 1970(Jul), Vol. 9(3), 532-547.—Presented case histories of 5 schizophrenic girls, who responded to separation and the threat of object loss with varieties of distortion and fragmentation of their body. This threatened loss of body integrity precipitated severe anxiety which activated primitive defensive maneuvers designed to repair the body distortions and to reestablish ties with the lost object. These defenses included introjective and incorporative mechanisms designed to achieve a symbiotic fusion with the significant person, who was often responded to as a part object. Ss also made frequent use of transitional objects and fetishistic behavior as a means of maintaining perceptual contact with significant persons. This reaction is explained by their perceptual, cognitive, and integrative failure, which impairs their ability to internalize stable images of the objects in their absence. Similar inability to conceptualize a constant body image also contributes to excessive dependence on the adult for the maintenance of body integrity. 1 common defensive adaptation, the illusory penis phenomenon, was discussed, with special reference to the role of the family constellation in its genesis. The clinical observation that the girls manifested greater difficulty with separation and the maintenance of body integrity than boys in a schizophrenic population is attributed to their sense of genital damage, a more complex genital structure and physiology, a greater dependency on their mothers for bodily definition and identification, and cultural attitudes which encourage them toward a greater body cathexis. Some therapeutic principles are outlined which promote object constancy and augment more adaptive defenses concerned with securing the body's integrity. (17 ref.)

6709. Held, Joan M., Cromwell, Rue L., Frank, E. T., & Fann, William E. (Vanderbilt U., Medical School) **Effect of phenothiazines on reaction time in schizophrenics.** *Journal of Psychiatric Research*, 1970(Feb), Vol. 7(3), 209-213.—A 2-wk substitution of placebo for routine phenothiazine therapy did not appear to affect RT. (21 ref.)—R. V. Hamilton.

6710. Hoffer, A. **Pellagra and schizophrenia.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 522-525.—Discusses whether pellagra and schizophrenia are both due to a deficiency of nicotinamide adenine dinucleotide (NAD). It is noted that some of the early descriptions of pellagra were similar to those of schizophrenia. Similarities between the 2 diseases include disturbances in process and content of thinking, mood changes, and perceptual disorders leading to bizarre and antisocial behavior. Major differences are found in characteristic pellagrous skin and changes in the gastrointestinal system. It is concluded that while pellagra and schizophrenia are "clinically identical orthomolecular diseases," their reason for deficiency in vitamin B3 differs. In pellagra the diet is deficient, and in schizophrenia

"there is a 'block' between the substrate vitamin B-3 and its synthesis into NAD." (36 ref.)—P. McMillan.

6711. Hoffman, A. & Parhon-Ştefănescu, Constanța. (Gh. Marinescu Hosp., Psychiatric Clinic, Bucharest, Romania) **Cercetări asupra capacității de muncă a bolnavilor schizofrenici.** [Investigations on the working capacity of schizophrenic patients.] *Neurologia, Psihiatria, Neurochirurgia*, 1969(Jan), Vol. 14(1), 17-25.—Describes a follow-up study of working capacity and behavior at work and in the family of 50 schizophrenic patients, treated in a Bucharest clinic. Data indicate that: (a) both longer remissions or more frequent relapses with shorter remissions had occurred; (b) some Ss had resumed their former occupations or were working in supervised workshops; and (c) in more cases, S's behavior toward friends and family was good. (French, German, & Russian summaries) (17 ref.)—English summary.

6712. Iovlev, B. V., et al. (Bekhterev Research Psychoneurological Inst., Leningrad, USSR) **Fakturny analiz v issledovaniyakh s primeneniem otsennochnykh psikhopatologicheskikh shkal.** [Factor analysis in studies using psychopathological rating scales.] *Zhurnal Nevropatologii i Psikhiatrii*, 1970, Vol. 70(3), 399-408.—Demonstrates the possibility of using special psychopathological scales to study (a) the interconnection of psychopathological symptoms in evaluating the rehabilitation of mental patients, and (b) the connection between psychopathological and biological indices. Factor analytic materials dealing with schizophrenia and depressive states are presented. (English summary)—I. D. London.

6713. Lupandin, V. M. (Inst. of Psychiatry, Moscow, USSR) **Kliniko-psikhopatologicheskie osobennosti pristupoobraznoi shizofrenii u detei i podrostkov: I. Periodicheskaya forma.** [Clinico-psychopathological features of attacklike schizophrenia in children and adolescents: I. Periodic form.] *Zhurnal Nevropatologii i Psikhiatrii*, 1970, Vol. 70(3), 425-430.—Observed 41 girls and 13 boys with periodic schizophrenia. 29 were studied during treatment for the psychosis and catemnestically for a 1-8 yr. period; 25 were studied only catemnestically 20-30 yr. after the onset of the psychosis. In childhood periodic schizophrenia (8-9 yr.), the attacks that were encountered were similar to those seen in adults. However, (a) they were elementary in psychopathological structure, (b) there were no delusions of significance as so frequently seen in adults, and (c) there were no fantasy delusions or instances of psychic automatisms. The attacks were characterized by more marked motor and sensory disorders. In adolescence the attacks resembled those of adults except that delusional states exhibited more frequently a reduced character, whereas motor and sensory disorders, and disorders related to reflexes, were more grossly expressed. Results appear to confirm the hypothesis that the establishment of psychic functions takes place approximately in the interval of time between 12 and 13 yr. (English summary) (31 ref.)—I. D. London.

6714. Magaro, Peter A. (U. Maine) **An hypothesis concerning the relations between drive and size estimation for paranoids and nonparanoids within specific schizophrenic subgroups.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 489-490.—Describes the relation between 2 skin-resistance measures and size estimation for previously described schizophrenic subgroups; in the acute poor and chronic good subgroups

size estimation was positively related to drive for paranoids and negatively related for nonparanoids. Paranoids in the chronic poor subgroup exhibited a negative size estimation-drive relationship, considered to be due to reduction in drive which allowed emergence of a functioning perceptual organization that permitted S to attend to the task and show a corresponding increase in size estimation.—Journal abstract.

6715. Melges, Frederick T. (Stanford U., Medical School) **Postpartum psychiatric reactions: Time of onset and sex ratio of newborns.** *Science*, 1969(Nov), Vol. 166(3908), 1026-1027.—Investigated a study by M. A. Taylor in which he postulated "a causal relationship between birth of a male infant and postpartum schizophrenia. He speculated that delivery of a male child unmasks the mother's schizophrenia by allowing a 'toxic blood factor,' previously inhibited by the fetus, to take effect." Studies made of the sex ratio of infants born to women with onset of psychiatric symptoms within 1 mo. or 10 days postpartum (the period of rapid hormonal changes most likely to reflect postnatal influences of fetal sex) showed no predominance of male infants. Comparisons with infants born to patients in other diagnostic categories also showed no significant difference in ratio of sexes.—P. McMillan.

6716. Mosher, Loren R. & Feinsilver, David. **Special report on schizophrenia.** Washington, D.C.: U.S. Dept. of Health, Education, & Welfare, 1970. 16 p.—Reviews current research into the nature, causes, and treatment of schizophrenia. The supporting role of the National Institutes of Mental Health and other health organizations is described. Problems of diagnosis and classification through cross-cultural research are examined, noting difficulties of diagnostic comparability and methodologic imprecisions. Highlights of biologic, genetic, and family studies are separately examined for their contribution to the further understanding of schizophrenia. New insights into childhood schizophrenia and various treatment methods are also presented. It is concluded that prevailing opinion favors "multiple entities within the disorder" as the most tenable explanation of the nature of the disease.—P. McMillan.

6717. Obiols, VÍ, J. **Fenomenología de los mecanismos de simbolización en el hombre normal y en el esquizofrénico.** [Phenomenology of the mechanisms of symbolism in the normal and schizophrenic man.] *Revista de Psiquiatría y Psicología Médica*, 1969(Jul), Vol. 9(3), 127-141.—By analyzing phenomenologically the processes of symbolism observed in normal and schizophrenic behavior, different fundamental characteristics which make it possible to know the nature and essence of mental disease can be found. It is argued that: (a) psychoanalytic symbolism is relative and subjective, (b) symbolism is always anthropocentric, (c) no symbol is universal or eternal, (d) a symbol may or may not be observed as such, and (e) a symbol may be a biological constant. It is believed that symbolism and a phenomenological analysis adds to traditional psychoanalysis the importance of free choice by the S, his "free acts," his conscious behavior, tastes, desires, and life style. Through an existential and anthropological attitude: conscious free choice takes the place of the unconscious, the sexual aspect in psychic acts is diminished, and every manifestation is taken in-itself toward the fulfillment of the for-itself. Following a philosophic interpretation of being, having, and doing, it is assumed that: (a) desire and knowledge imply a lack of

being and longing for possession; (b) play (i.e., in sport) becomes a means toward a fulfillment of being and possession; and (c) possession can imply destruction for the schizophrenic. It is also assumed that the schizophrenic is unable to know, create, and possess, although money becomes important to him. It is suggested that food and its selection by a schizophrenic, physical contact, disease, and death must be thoroughly examined anthropologically. (23 ref.)—*S. Maze.*

6718. **Ornitz, Edward M.** (U. California, Medical School, Los Angeles) **Vestibular dysfunction in schizophrenia and childhood autism.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 159-173.—Central vestibular mechanisms play a basic role in the pathogenesis of schizophrenia and childhood autism. Disturbances of perception and motility occurring in schizophrenic adults and autistic children are attributed to vestibular dysfunction during REM sleep and waking. This dysfunctioning appears to be maturationally determined. (75 ref.)—*D. Prager.*

6719. **Roth, Sheldon.** (National Inst. of Mental Health, Bethesda, Md.) **The seemingly ubiquitous depression following acute schizophrenic episodes, a neglected area of clinical discussion.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 51-58.—Notes that 2 phases which follow acute schizophrenic episodes: compensated-transition and depressive-neurasthenic phases, are often treated too lightly. Because the psychotic patient has the inability to cope with either real or imaginative object loss and cannot relate to his surrounding environment, depressive states are often brought about by favorable response to psychotherapeutic treatment. These latter stages of psychosis are viewed as being important and treatment by the same physician is urged following 3 basic steps outlined by E. V. Semrad: (a) "help the patient to acknowledge (substitution of 'real' affect for psychotic symptoms)," (b) "bear (mourn with the patient, increase the ego's ability to bear anxiety and sadness)," and (c) "put his life into perspective (working through one's feelings about one's abilities and disabilities as a person)." More research and greater emphasis in residency programs are recommended.—*P. R. Shibelski.*

6720. **Rubin, Leonard S. & Barry, Theodore J.** (U. Pennsylvania) **Dysautonomia in schizophrenic remission.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 506-512.—Investigated whether (a) patients in remission show aberrant autonomic responses comparable to those shown by actively psychotic schizophrenics at rest, and (b) whether schizophrenics in remission show autonomic responses during stress and at the end of stress that are different from normal patients or patients who are actively psychotic. Pupillary reactivity was used as the measurement of autonomic responsivity on 43 psychotic patients, all diagnosed as schizophrenic, 27 of whom were judged actively psychotic at the time of examination. Results suggest that schizophrenic patients in remission, as well as those actively psychotic, show nonintegrative autonomic activity at rest, during stress, and following the termination of stress. It is concluded that the adaptive synergistic relationship between sympathetic and parasympathetic systems is not found in schizophrenia. The utility and power of pupillography for diagnosis and classification of schizophrenia is suggested. (21 ref.)—*P. McMillan.*

6721. **Scherer, Milo W.** (U. California, Los Angeles) **Width of cue utilization, selective attention and**

development of a set in facilitation of visual reaction time among chronic and acute schizophrenics. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 920-921.

6722. **Shader, Richard I. & Grinspoon, Lester.** (Harvard, Medical School, Boston, Mass.) **The effect of social feedback on chronic schizophrenic patients.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 196-199.—Feedback on patterns of social interaction was given to 10 chronic schizophrenic patients at their weekly ward community meetings for a 4-wk period. This feedback produced a significant decrement in aloneness relative to the initial prefeedback period. Isolation had returned to the initial prefeedback level 6 mo. later when a replication of the feedback procedures again produced a similar aloneness decrement. No differences were observed between drug and placebo patients. (15 ref.)—*Journal summary.*

6723. **Shapiro, Theodore; Roberts, Arlene, & Fish, Barbara.** (New York U., Medical School) **Imitation and echoing in young schizophrenic children.** *Journal of the American Academy of Psychiatry*, 1970(Jul), Vol. 9(3), 548-567.—Compared imitative responses of 8 schizophrenic children at or near their 4th birthday to those of control groups of 6, 4, 3, and 2 yr. olds without symptoms and to 3 nonschizophrenic hospitalized children. The imitations were extracted from single 10-min interviews. Ss were then divided into 5 categories ranging from exact congruent echoing to creative use of the examiner's words into newly structured sentences. The criteria for categorization were based on structural-grammatical differences. The schizophrenic Ss spoke as often as the controls but were retarded in the length and expansiveness of their utterances. Ss also had a significantly greater proportion of imitations than the 3 and 4 yr. olds. When considering the relative rigidity of their utterances, Ss had significantly more congruent echoes than even the 2-yr-old controls. The hospitalized nonschizophrenic group fell between the 2 yr. olds and schizophrenic Ss. Data indicate that the speech of 4-yr-old schizophrenic Ss was not only retarded but developmentally deviant. Normal children integrate the words of the mother into new structures and relate them to new categories in a flexible form even at 2 yr. This deviance in schizophrenic speech was discussed as a defect in integrative function accounting for the rigidity of imitation. This rigidity in language structure is explored as an index to the general rigidity of identification and ego structure. (52 ref.)—*Journal summary.*

6724. **Shimkunas, Algimantas M.** (U. Missouri) **Reciprocal shifts in schizophrenic thought processes.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 423-426.—Examined changes in abstract, concrete, and autistic responses to proverbs by 36 acutely disturbed schizophrenics. Abstract responses increased, while autistic responses decreased significantly from admission to the 5th wk. of hospital treatment. These changes accompanied a significant decrease in degree of psychopathology. Virtually no change was noted in concrete responses to Proverbs and Vocabulary IQ scores. Data support a revised version of K. Goldstein's theory of cognitive deficit and suggest an extension of the formulations of interference theory. (17 ref.)—*Journal abstract.*

6725. **Shumakov, V. M.** (Inst. of Psychiatry, Moscow, USSR) **Alkoholizm u bol'nykh shizofreniei.** [Alcoholism in schizophrenics.] *Zhurnal Nevropatologii i*

Psikhiatrii, 1970, Vol. 70(3), 435-443.—Observed 85 alcoholic and 67 nonalcoholic schizophrenics in a clinicocatamnestic study of the features characterizing the emergence and course of alcoholism and schizophrenia in mutual conjunction, considering the various forms of the latter. It is shown that in most cases the predisposition toward the use of alcohol was the result of the psychosis and can be correlated with various psychopathological factors. Different degrees of the psychosis are noted among the different forms of schizophrenia. Alcohol influences the psychopathological structure and development of schizophrenia depending on the form of the psychosis, its stage, and individual traits. Outpatient and hospital treatment of schizophrenia complicated by alcoholism, and the preconditions for more effective therapy and organization of social aid are discussed. (English summary) (31 ref.)—*J. D. London*.

6726. Stam, F. C., Heslinga, F. J., & van Tilburg, W. (Free U., Valerius Clinic, Amsterdam, Netherlands) **Schizophrenia and pink spot.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Nov), Vol. 72(6), 513-524.—Postulates that studies of the correlation between schizophrenia and 3,4-dimethoxyphenylethylamine (DMPE) require an operational definition. Reports so far published indicate that the pink spot described by A. J. Friedhoff and E. Van Winkle is probably not identical with DMPE. The negative results of other investigators are ascribed to the technique used. A technique developed to convincingly demonstrate the pink spot is described. The pink spot was found in some 80% of the schizophrenic patients examined. (32 ref.)—*Journal summary*.

6727. Stoyanov, St. & Liberman, Yu. I. (Research Inst. of Neurology & Psychiatry, Sofia, Bulgaria) **O nekotorykh statisticheskikh kharakteristikakh patokineza shizofrenii, protekayushchei s pristupami, soprovozhdayushchimiya maniakal'nyimi rasstroistvami.** [On several statistical characteristics of the pathokinesis of schizophrenia, proceeding with attacks accompanied by manic disorders.] *Zhurnal Nevropatologii i Psikhiatrii*, 1970, Vol. 70(3), 418-424. Presents a statistical study of the dynamics of schizophrenia whose course is attacklike and is marked at some stage by the advent of manic disorders in the form of either pure manic attacks or attacks that are "acutely paraphrenic, manic-delusional, polymorphous manic-catatonic, [or] manic-hebephrenic." [26 schizophrenics served as Ss. In this group other types of attacks were seen besides the manic attacks. As the psychosis developed, catatonic, hebephrenic, and hallucinatory-delusional disorders became more prominent along with a diminution of the depth of the affective disturbances occurring. The oneiroid syndrome occurred twice as frequently in persons up to 20 yr. than it does where the onset is at a later age. In females there was a relatively larger number of attacks than in males (mainly due to more frequent depressive-paranoid attacks). Males displayed a large number of remissions with mildly expressed personality changes. In females the remissions were characterized by affective fluctuations and neurotiform states. (English summary) (24 ref.)—*J. D. London*.

6728. Sussman, Sylvia & Sklar, June L. (Kaiser Allergy Research, San Francisco, Calif.) **The social awareness of autistic children.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 798-806.—Ob-

served interaction in a day setting for 10 4-7 yr. old autistic children. It was posed that if autistic children were unresponsive to social cues their behavior would not be socially patterned. Analysis of interactions showed both workers and children to be highly responsive to each other and to context.—*Journal abstract*.

6729. van Epen, J. H. (Delta Hosp., Poortugaal, Netherlands) **Defect schizophrenic states (residual schizophrenia): A clinical study prompted by K. Leonhard's classification.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Jul), Vol. 72(4), 371-394.—Studied 183 male and 173 female chronic schizophrenics to establish whether K. Leonhard's classification of defect schizophrenic states could be traced in this material. A description of K. Leonhard's concepts about schizophrenia is followed by a report on the procedure and results of the follow-up study. Findings correspond to those previously reported. However, unlike Leonhard, it was found that afflicted near relatives of a schizophrenic show another type of schizophrenia than the proband.—*Journal summary*.

6730. Yates, Aubrey J. & Korboot, Paula. (U. Western Australia, Nedlands) **Speed of perceptual functioning in chronic nonparanoid schizophrenics.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 453-461.—Measured inspection time, uncontaminated by verbal response time, for groups (N=10 in each group) of acute and chronic paranoid schizophrenics, nonparanoid schizophrenics, and neurotics on 3 types of material (lines, words, and symbols) at each of 5 degrees of complexity. The chronic nonparanoid schizophrenic group was significantly slower than all other groups at all levels of complexity for 3 types of material, with the exception of the verbal material, in the comparison with acute nonparanoid schizophrenics. Results are discussed in relation to theories of slowness of functioning in schizophrenia. (30 ref.)—*Journal abstract*.

6731. Young, Sylvia T. (U. California, Los Angeles) **Visual attention in autistic and normal children: Effects of stimulus novelty, human attributes, and complexity.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 922-923.

Schizophrenia Treatment

6732. Bucci, Luigi; Fuchs, Maria; Simeon, Jovan, & Fink, Max. (New York Medical Coll., Metropolitan Mental Health Center) **Depot fluphenazine in the treatment of psychosis in a community mental health clinic.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 28-31.—Administered to 80 consecutive schizophrenic patients in a community mental health clinic either depot fluphenazine decanoate or depot fluphenazine enanthate. After stabilization, 40 Ss were transferred to the other dosage form. Both drugs successfully modified the psychotic pattern in 87.5% of the cases. The average dose and interinjection intervals were .88-.91 cc and 18.9-20.6 days. Priming with oral fluphenazine was not necessary to achieve satisfactory clinical effects with either depot form.—*Journal summary*.

6733. Goldstein, Burton J. (U. Miami, Medical School) **Comparative efficacy of thiothixene capsules and concentrate in acutely schizophrenic patients.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 434-437.—Attempts to demonstrate the utility of small sample methodology in psychopharmacology research in

which a single investigator conducts a series of small studies using identical protocols and criteria for patient selection and improvement. 31 newly admitted acutely schizophrenic patients were treated for a 6-wk period with thiothixene in either capsule or oral concentrate form. Laboratory studies were made before and after treatment and psychiatric rating scales were obtained at regular intervals. Results suggest that thiothixene in either capsule or concentrate form is an effective antipsychotic medication. Side effects were judged to be transient and moderate in severity. It is concluded that this methodology is useful for pilot studies of new compounds rather than for more extensive investigations of drug effectiveness.—*P. McMillan.*

6734. Gorham, Donald R., Green, Louise W., Caldwell, Lynn R., & Bartlett, Ellen R. (Veterans Administration Center, Bath, N.Y.) **Effect of operant conditioning techniques on chronic schizophrenics.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 223-234.—The existence of a system of quarterly ratings by nurses of psychiatric patients' behavior made possible a relatively objective evaluation of the effects of the introduction of an operant conditioning program on 1 ward. 66 patients were rated 6 mo. prior to, immediately prior to, and 3, 6, and 9 mo. subsequent to the introduction of the new treatment regimen. Whereas the behavior on 24 rated items was stable during the period preceding the new treatment, statistically significant changes occurred on 14 behavior items during the treatment period. Worsening of a group of symptoms during the early months of treatment followed by subsequent improvement seems explainable as an aggravation of chronic schizophrenics by a change of their life style. The important finding was that after 9 mo. of operant conditioning techniques, even hard-core psychotic symptoms yielded to this form of behavior modification.—*Journal abstract.*

6735. Gottschalk, Louis A., et al. (U. California, Medical Coll., Irvine) **Prediction of changes in severity of the schizophrenic syndrome with discontinuation and administration of phenothiazines in chronic schizophrenic patients: Language as a predictor and measure of change in schizophrenia.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 123-140.—Studied 74 24-54 yr. old schizophrenics for 8 wk. to evaluate the effect of withdrawal and readministration of phenothiazines. No significant differences were found. Theoretical and practical implications of findings are discussed. Further research studies are needed to account for the underlying mechanisms of the differential response to phenothiazine withdrawal. (34 ref.)—*D. Prager.*

6736. Greenbaum, Gerald H. (U. Toronto, Ontario, Canada) **An evaluation of niacinamide in the treatment of childhood schizophrenia.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 89-92.—Employed 57 4-12 yr. old schizophrenic children in a double-blind study to test the claim that massive doses of niacinamide control and significantly reduce childhood schizophrenia. Ss were divided into 3 groups: 17 received niacinamide (N group), 16 received niacinamide plus a tranquilizer (NT group), and 24 received a placebo (P group). The mauve factor, a supposed diagnostic and prognostic indicator in schizophrenia, was tested for, found to be negative, and subsequently discontinued as invalid. Before and after the 6-mo study, Ss were rated on a scale of 15 observable categories. The Wilcoxon

matched pairs test showed an improvement in the average scores of the N group of 4 units and in P group of 2.6 which was significant ($p < .05$), whereas the difference of 1.5 in the NT group was not significant ($p > .05$). Results show no appreciable difference in improvement between those who used niacinamide and those who did not. It is concluded that the drug is not as effective as previously thought and that the improvement was through maturation factors alone. (20 ref.)—*P. R. Shibelski.*

6737. Grosser, H. H. (Psychiatric Hosp., Herborn, W. Germany) **Experience of psychiatric management of schizophrenia with fluphenazine decanoate.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 32-36.—Describes a double-blind controlled trial comparing the effects of fluphenazine decanoate and fluphenazine enanthate. Ss were acute and chronic female schizophrenic patients (38 recently admitted, and 23 hospitalized for more than 1 yr.). Results indicate (a) similarity of the 2 drugs in overall therapeutic effectiveness; (b) no significant difference between the drugs regarding their influence on psychotic behavioral disorders; (c) length of effectiveness of a single injection to be practically the same for both drugs within similar patient populations, but between diagnostic categories to be considerably longer with chronic Ss; and (d) occurrence of general side effects under both drugs, with acute Ss developing them more frequently under enanthate, and chronic Ss under decanoate. Extrapyramidal side effects, however, occurred significantly less frequently under decanoate than under enanthate. It is concluded that the decanoate showed equal or better antipsychotic properties than the enanthate.—*Journal summary.*

6738. Hawkins, David R., Bortin, Aaron W., & Runyon, Richard P. (North Nassau Mental Health Center, Manhasset, N.Y.) **Orthomolecular psychiatry: Niacin and megavitamin therapy.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 517-521.—Describes the concept of orthomolecular psychiatry and its clinical application to schizophrenia. This approach utilizes an overall biochemical and pharmacologic approach in an attempt to correct either demonstrated or hypothesized biochemical abnormalities. An aftercare study including 160 patients (median age, 28) in whom $\frac{1}{2}$ were continued on megavitamin therapy is described. A correlation was established showing that the relapse rate among the megavitamin therapy group was approximately $\frac{1}{2}$ that of the control group. Findings suggest that orthomolecular therapy may be the best method of treatment for many patients. Because of variables which could not be controlled, however, an absolute causal relationship will have to be demonstrated by future studies. (112 ref.)—*Journal summary.*

6739. Higgs, William J. (U. Maryland) **Effects of gross environmental change upon behavior of schizophrenics: A cautionary note.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 3(76, Pt. 1), 421-422.—Modeled a study after the innovative treatment design for hospitalized neuropsychiatric patients, in which 1 group of patients receives a treatment while a comparable group does not. A simple administrative change in physical environment was substituted for the therapeutic "treatment." 68 "treated" Ss showed short-term changes in both behavioral appropriateness and overall pathology, with changes in the former variable also persisting over a longer period. 125 schizophrenic patients on a set of unmoved wards served as controls.

Behavior was measured by the Brief Psychiatric Rating scale and a time-sampling record of ward dayroom behavior.—*Journal abstract.*

6740. Hillel, Jean M., Albert, J. M., & Tetreault, L. (St. Charles Hosp., Inst. of Psychiatric Research, Joliette, Quebec, Canada) **Etude comparative de la thiothixène et de la trifluopérazine chez le schizophrène en phase aiguë.** [A comparative study of thiothixene and trifluoperazine in acute schizophrenic episodes.] *Encéphale*, 1970(Mar), Vol. 59(2), 162-179.—Studied 40 patients for 35 days posthospitalization. Intensity of symptoms was evaluated by the Inpatient Multidimensional Psychiatric Scale and global clinical evaluation. The antipsychotic action of the 2 drugs was comparable for the 1st wk., trifluoperazine (stelazine) was moderately more effective during the 2nd wk., and the results were comparable again in the 3rd and following wk. The incidence of extrapyramidal side effects was significantly less with thiothixene after 35 days of treatment.—*W. W. Meissner.*

6741. Itil, T. & Keskiner, A. (U. Missouri, St. Louis) **Fluphenazine hydrochloride, enanthate, and decanoate in the management of chronic psychosis.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 37-42.—Describes 4 experiments investigating the effect of long-acting phenothiazines in maintenance therapy with 82 chronic schizophrenic patients. The studies involved (a) a double-blind study comparing the clinical effectiveness of low and high doses of fluphenazine hydrochloride, (b) the effects of fluphenazine decanoate in patients with florid psychotic symptoms or whose psychopathology was controlled by other drugs, (c) the effectiveness of fluphenazine decanoate in a schizophrenic outpatient population, and (d) a comparison of the effectiveness of fluphenazine decanoate and enanthate. Results indicate that long-acting fluphenazine enanthate and decanoate are both effective as substitutes for daily oral psychotropic drugs in nonhospitalized schizophrenics. Decanoate seemed to have a longer duration of effectiveness with fewer extrapyramidal reactions than enanthate.—*P. McMillan.*

6742. Itil, T., et al. (U. Missouri, Medical School, St. Louis) **Treatment of resistant schizophrenics with extreme high dosage fluphenazine hydrochloride.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 456-463.—Compared 11 25-53 yr. old chronic therapy schizophrenics receiving high dosage fluphenazine hydrochloride (800 mg/day) with 11 Ss receiving low dosage (30 mg/day). Study design was a double-blind crossover. 6 Ss showed marked improvement with high dosage and 3 with low dosage treatment. Statistical analysis of the global evaluations demonstrated that the high dosage was significantly more effective than the low dosage treatment. More psychotic symptomatology, however, was improved with the low dosage. Extrapyramidal side effects were seen with both dosages, but more frequently with the high dosage. None of the clinical or laboratory side effects continued after dosage was decreased. The significance of high dosage treatment with therapy resistant schizophrenics is discussed in relation to the pathogenesis of resistant schizophrenia. (44 ref.)—*Journal summary.*

6743. Kraus, Robert F. (Woman's Medical Coll. of Pennsylvania) **The use of symbolic technique in the group psychotherapy of chronic schizophrenia.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 143-157.—Contributes to the subject of orality in schizophrenia

and its clinical management by symbolic means. A unique psychotherapeutic experience with a group of 6 severely and chronically ill young schizophrenic women whose therapeutic interaction was marked by the spontaneous appearance and elaboration over a period of months of a group fantasy of eating is described and discussed. Changes in this fantasy as it ran its course seemed to be associated with clinical improvement in the patients. (20 ref.)—*Journal abstract.*

6744. Kurland, Albert A., Dim, Bomen H., & Olsson, James E. (Maryland Psychiatric Research Center, Baltimore) **The effectiveness of parenteral administration of fluphenazine decanoate in the treatment of chronic schizophrenics.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 18-23.—Demonstrated the effectiveness of parenteral administration of fluphenazine decanoate as a maintenance treatment for chronic schizophrenic patients previously found to be responsive to oral fluphenazine. 13 23-58 yr. old Ss completed the decanoate treatment course, which averaged 6 mo. in length. 3 Ss were discontinued because of poor therapeutic response. Psychiatrists' ratings of discomfort and adaptability revealed no significant differences between oral fluphenazine and decanoate treatment. Data concerning the number of decanoate injections, length of intervals between injections, and dosage levels are also reported. The advantages and disadvantages of fluphenazine decanoate treatment are discussed in terms of ease and reliability of administration, extrapyramidal effects, and blood pressure changes.—*Journal summary.*

6745. Missirlu, V., et al. **Probleme de reincadrare în muncă a bolnavilor de schizofrenie trecuți prin Serviciul I medical de expertiză și recuperare a capacității de muncă al Municipiului București.** [Problems in the resumption of work of schizophrenic patients examined in the 1st Medical Unit of the Rehabilitation Experts, Bucharest.] *Neurologia, Psihiatria, Neurochirurgia*, 1969(Jan), Vol. 14(1), 11-15.—Discusses the rehabilitation of schizophrenics and suggests that whenever possible schizophrenics should resume their occupations since this strengthens the chance of rehabilitation. Account must be kept of the symptomatology, stage of the disease, and occupational qualifications of the patient. Listing of schizophrenics in a lower grade of invalidity is possible, especially when requested by the patient. This usually occurs in the paranoid form of the disease. (French, German, & Russian summaries) (33 ref.)—*English abstract.*

6746. Neal, C. D. & Imlah, N. W. (Shelton Hosp., Shrewsbury, England) **Institutional management of chronic schizophrenics with fluphenazine decanoate.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 24-27.—Reports results of the treatment of 20 male chronic schizophrenic inpatients with fluphenazine decanoate. The initial injection of 12.5 mg. produced a rapid response, with the maximal effect appearing within the 1st 7 days. This observation was supported by a reduction over this period of the scores of the Brief Psychiatric Rating scale by 30% and of the Nurses Behaviour Rating scale by 25%. There was some further clinical improvement during the 2nd wk. of treatment, after which the rating score remained approximately constant for the remainder of the trial. The mean duration of effects from a single injection of 25 mg. fell between 3 and 4 wk. This form of medication was readily accepted by Ss, and in a few cases, the antipsychotic

activity of the drug was apparent within a few hr. following injection. Although signs of extrapyramidal involvement appeared (including akathisia and parkinsonism), most reactions were mild. 1 S had a convulsion 2 days after receiving the 1st full injection of 25 mg. No further convulsion occurred after a subsequent dose of 25 mg.—*Journal summary.*

6747. Pérez Sanfélix, J., et al. **Estudio clínico del TPN-12 (Imagotan) en 40 esquizofrénicos hospitalizados.** [Medical study of the effect of TPN-12 (imagotan) on 40 hospitalized schizophrenics.] *Revista de Psiquiatría y Psicología Médica*, 1969(Jul), Vol. 9(3), 160-165.—Examined the effect of imagotan (TPN-12) on 20 acute and 20 chronic cases of 20-50 yr. old male hospitalized schizophrenics. Acute symptoms included drastic changes of behavior, psychomotor agitation, incoherent speech, hallucinations, and anxiety. Chronic symptoms included difficulty in relating, negativism, and loss of thought. TPN-12 was given orally (50-mg pills), or im (50-mg injections). The 4-mo experiment was studied through use of the Overall and Gorham evaluation and individual medical histories. Observations of the Ss' condition was made prior to use of the drug, during the 1st wk., 2 wk. later, monthly, and at termination of the experiment. Blood and urine were tested. Results among acute and chronic cases show TPN-12 to be very effective. Some secondary effects were noted, but could be overcome with proper medication. It is concluded that (a) TPN-12 is an effective neuroleptic drug, especially with acute cases. (b) There was no correlation between intensity of secondary effects and therapeutic effectiveness. (c) Compared to chlorpromazine, TPN-12 produced less apathy. And (d) TPN-12 must be administered carefully, should be included among present drugs, but should not be used by a doctor not trained in neuroleptics.—*S. Maze.*

6748. Polvan, N. (Neuropsychiatric Clinic, Istanbul, Turkey) **Fluphenazine hydrochloride and enanthate in the management of chronic psychosis.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9, Suppl.), 48-49.—In an experiment with 14 chronic therapy resistant schizophrenic patients, it was found that fluphenazine hydrochloride was more effective and caused fewer side effects in high doses (100 mg. initially, increasing to 600-800 mg/day) than in lower doses (25-60 mg/day). It is noted that side effects appeared quite rapidly and were more pronounced with the low dosage. In high dosage without antiparkinsonian drugs, however, sedation and somnolence were observed. In very high doses (900-1200 mg.), depression was observed with a slight background rigidity. In an experiment with 55 ambulatory schizophrenics with acute symptomatology, it was found that with the administration of 1 cc fluphenazine enanthate every 2 wk., all delusional and persecutive ideas disappeared. This drug can also be used for maintenance therapy after high dosage fluphenazine hydrochloride treatment in chronic schizophrenic patients.—*Journal summary.*

6749. Rodríguez Suárez, Francisco J. & Concepción Pérez, Antonio. **Tratamiento de esquizofrénicos antiguos con dosis altas de reserpina.** [Treatment of chronic schizophrenics with high doses of reserpine.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1968(Sep), Vol. 27(4), 556-595.—Tested 30 chronic schizophrenics (15-50 yr. old) who had a history showing a poor prognosis and had been treated with at least 3 medications without obtaining improvement. Ss were

given 100 mg/day of chlorpromazine (thorazine, minor tranquilizer) for the 1st 2 days of treatment, 100 mg/day promethazine (fenegan) during the entire treatment period, and reserpine (serpasil, major tranquilizer) in elixir in doses which began with 3.2 mg. and were gradually increased to 44.8 mg/day. Results were favorable, with 23.33% of the Ss showing complete remission, 26.66% showing social remission which enabled them to be integrated back into society, and 23.33% showing remission within their establishment, which involved improved adjustment to hospital life. In all Ss, a marked Parkinsonian syndrome was evident, but remitted without residual effects. Reserpine therapy was recommended in association with occupational therapy. (English summary)—*P. Hertzberg.*

6750. Stanciu, Eugenia; Grecu, Gh., Cseh, Anna M., & Balint, Rozalia. (Psychiatric Clinic, Tirgu Mures, Romania) **Rezultatele dispensarizării și unele aspecte ale readaptării sociale a bolnavilor schizofrenici în orașul Tirgu Mureș.** [Results of outpatient care and certain aspects in the social rehabilitation of schizophrenics in Tirgu Mureș.] *Neurologia, Psihiatria, Neurochirurgia*, 1969(Jan), Vol. 14(1), 27-32.—Presents results of the social rehabilitation of 76 schizophrenic patients after the introduction of outpatient care. 31 Ss were in the course of complete remission, with 27 minimal and 18 acceptable social remissions. Social and vocational rehabilitation was possible in 26 cases who were able to resume their former occupations. Others were pensioned or had simple jobs. Optimal environmental conditions and the necessity of maintenance treatment are emphasized and cooperation with a psychiatric department with vocational therapy is stressed. (French, German, & Russian summaries) (23 ref.)—*English summary.*

6751. Tappan, Cindy B. (Veterans Administration Hosp., Nursing Service Lenwood Div., Augusta, Ga.) **A program of resocialization for a long-term regressed schizophrenic patient.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Nov), Vol. 6(6), 334-335.—Reports on the use of resocialization techniques to help a long-term 47-yr-old male schizophrenic regain control over his behavior and learn to differentiate between fantasy and reality. The interpersonal process, group interactions, and reality-oriented diversional experiences were utilized in treatment. The interpersonal process was centered around continual acceptance of S, showing recognition and acceptance of realistic behavior and talk, and rejection of behavior beyond the bounds of social acceptance. An approach, which emphasized that realistic talk and acceptable behavior were expected from the S, was consistently used by all personnel involved in his care. This approach was considered a significant factor in S's progress.—*Journal summary.*

6752. Tedeschi, G. **Psicoterapia analitica (C. G. Jung) della schizofrenia.** [Analytic psychotherapy of schizophrenia according to C. G. Jung: A personal contribution.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1969(Mar), Vol. 30(2), 185-196.—Although Jung did not believe in the psychotherapeutic treatment of schizophrenia, the case of a Jewish schizophrenic who improved on the basis of expressing archaic biblical fantasies and the revival of an ancient rite from Leviticus is presented.—*L. L'Abate.*

6753. Truax, Charles. (U. Calgary, Alberta, Canada) **Effects of client-centered psychotherapy with schizophrenic patients: Nine years pretherapy and nine**

years posttherapy hospitalization. *Journal of Consulting & Clinical Psychology*, 1970(Dec), Vol. 35(3), 417-422.—The long-term effects on patient hospitalization of therapeutic conditions (accurate empathy, nonpossessive warmth, and genuineness) offered by therapists were compared to a control (no-therapy) group ($N = 16$) in a population of 32 schizophrenics. The study dealt with hospitalization experience over a 9-yr period prior to entry into therapy research and a 9-yr period after entry into therapy research. Findings indicate no overall mean differences but significant differences in trend tests across time. There was some evidence of negative effects from low levels of therapist-offered therapeutic conditions.—*Journal abstract*.

PSYCHOSOMATIC DISORDER

6754. **Gilbert, Michael M.** (U. Miami, Medical School) **Reactive depression as a model psychosomatic disease.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 426-428.—Formulates a model of reactive depression containing 3 basic criteria: (a) the condition must be produced by prolonged psychic stress, (b) it must involve structural or biochemical changes as a result of the stress, and (c) it characteristically occurs in a specific personality type described as perfectionistic, overconscientious, neat and orderly, etc. A case history is presented in support of this formulation. The application of the model to another psychosomatic disorder, that of peptic ulcer, is described.—*P. McMillan*.

6755. **Giordano, D. & Muzio, N. R.** **Rapporti fra cefalee psicogene e sentimenti di inferiorità.** [Relationships between psychogenic headaches and feelings of inferiority.] *Neuropsichiatria*, 1968(Jan), Vol. 24(1), 15-21.—In 10 cases of psychogenic headache, constant presence of inferiority feelings, high aspiration level, and parental overprotection were found.—*L. L'Abate*.

6756. **Sanger, Maury D.** (Albert Einstein Coll. of Medicine, Yeshiva U.) **Psychosomatic allergy.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 473-476.—Emphasizes the importance of recognizing psychological as well as physiological stress in the allergic patient. It is suggested that history-taking should allow sufficient time for the patient to discuss his case and ventilate his tensions. Examples are cited of cases with asthma and dermatitis, etc. where psychological factors (e.g., "the anniversary reaction" and "ring-finger" dermatitis) played a prominent role. Tables are provided which show responses of allergic patients to tranquilizers and to antidepressants. It is concluded that good rapport between patient and physician and mutual awareness of the possible emotional basis for allergic attacks can lead to quicker return to homeostasis in the patient.—*P. McMillan*.

6757. **Schwab, John J., McGinnis, Nancy H., Norris, Linda B., & Schwab, Ruby B.** (U. Florida, Medical School) **Psychosomatic medicine and the contemporary social scene.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1632-1642.—A scrutiny of the relationships between sociocultural processes and psychosomatic illness lead to the questioning of the relevance of current concepts of psychosomatic medicine to the contemporary social scene. Also, (a) the frequency and distribution of psychosomatic illnesses, (b) the demographic characteristics of the afflicted, (c) changing patterns of individual and group susceptibility, and (d) the emergence of newer forms of illness and the waning

of others are examined. In order to elaborate new concepts, psychosomatic medicine must draw upon the knowledge and help of the workers in the social sciences because our natural environment is increasingly man-made. It is concluded that to be relevant, psychosomatic medicine must meaningfully integrate ecological principles with its knowledge of psychic and physical processes. In view of the black-white confrontation, the rural-urban shifts, and the deprived-affluent inequities that disturb the social scene, the need for social homeostasis has only begun to be thought about. (4 p. ref.)—*Journal summary*.

6758. **Smith, Jackson A.** (Loyola U., Stritch Medical School, Maywood, Ill.) **Hypochondriasis: Symptom or entity.** *Psychosomatics*, 1970(Sep), Vol. 11(5), 413-415.—Views hypochondriasis as an entity in which patients become ill from complaints that have become in themselves an illness. These complaints are varied, long-standing, atypical, but not incapacitating. The symptoms exist without "demonstrable physical change or any typical aberration in the laboratory findings." It is suggested that the relationship between the hypochondriac and his physician can readily become "mutually accusatory," with the doctor accusing the patient of feigning his symptoms and the patient accusing the doctor of being unwilling to relieve his illness. It is concluded that in hypochondriasis "the complaints do not arise in response to outer events or known inner illness."—*P. McMillan*.

CASE HISTORY

6759. **Angrist, Burton M., Gershon, Samuel; Levitan, Stephan J., & Blumberg, Arnold G.** (New York U., Medical School) **Lithium-induced diabetes insipidus-like syndrome.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 141-146.—Reports 2 cases who developed a diabetes insipidus-like syndrome during the course of treatment with lithium salts for psychiatric disorders. The syndrome resolved after lithium was discontinued for up to 3 wk. It is suggested that the mechanism for this renal impairment is based on a temporary hypokalemic nephropathy.—*D. Prager*.

6760. **Aronson, Stanley M. & Aronson, Betty E.** (State U. New York, Downstate Medical Center, Brooklyn) **Clinical neuropathological conference.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 637-643.—Presents the case of a 66-yr-old female with presenting symptoms of throbbing of the head and pain over 1 eye, and later, vomiting, neck pain, increased blood pressure, and collapse. She was hospitalized upon subsequent loss of consciousness. A discussion of the clinical aspects of the case by a physician suggests a diagnosis of a primary vascular lesion such as an aneurysm of the brainstem. A discussion of pathological aspects of the case after autopsy suggests a diagnosis consistent with cryptococcal leptomeningitis, which may begin suddenly with a 1st complaint of headache. Neurological examination in these cases "may suggest a meningitis or even an expanding intracranial lesion."—*P. McMillan*.

6761. **Falk, K. & Holstein, P.** **Die optische Agnosie als diagnostisches Problem.** [Optic agnosia as a diagnostic problem.] *Psychiatria Clinica*, 1969, Vol. 2(6), 368-379.—Describes visual-agnosia and amnesic-aphasic disturbances occurring in a 65-yr-old thoroughly investigated patient suffering from acute cerebral ischemia with diabetes mellitus, latent cardiac failure, and generalized arteriosclerosis. The common charac-

teristics of object agnosias described in the literature can also be demonstrated in the present case. Besides a marked arteriosclerosis of the basal vessels, autopsy revealed an old softening in the left occipital cerebrum and a large angioma in the right basal ganglia. (17 ref.)—*Journal summary*.

6762. Gomez, Efrain A. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Uso compulsivo y dependencia física al meprobamato: A propósito de un consumidor de 24 gramos diarios.** [Compulsive use and physical dependence on meprobamate: On a consumer of 24 grams daily.] *Revisita de Neuro-Psiquiatria*, 1968(Sep), Vol. 31(3), 202-209.—Clarifies the nature of the compulsive use of meprobamate (equanil, a minor tranquilizer) in great quantities and makes suggestions for the therapeutic management of an abstinence program. The psychological implications of compulsiveness and previous research on meprobamate addiction are discussed. Points are illustrated by the case of a 26-yr-old male who was addicted for 10 yr. and reached a dosage intake of 24 gm. in 20 mo. before hospitalization. Individual treatment is considered to be relative to the dose and duration of addiction. Therapeutic measures stressed strict medical supervision, maintenance of hydroelectrolytic balance, vitamins, and the replacement of meprobamate with phenobarbital. During the initial hospitalization, the difficulty of diagnosing between severe intoxication and the abstinence syndrome is discussed. Psychological difficulties during the treatment period are considered. (30 ref.) (English, French, & German summaries)—*P. Hertzberg*.

6763. Green, Pat. (1038 Shepherd Dr., Corpus Christi, Tex.) **This bright child.** *Journal of Learning Disabilities*, 1968(Jul), Vol. 1(7), 423-428.—Presents a case report of a dyslexic child.

6764. Luria, A. R. & Klinkovskii, M. (Moscow State U., USSR) **O modal'noi organizatsii kratkovremennoi pamyati.** [On modality organization of short-term memory.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 80-85.—Reports results of experiments on memorization as a function of modal (auditory, visual) participation in the retention and reproduction of presented series of words and sentences. A 35-yr-old man with traumatic lesion of the left temporal region of the brain served as S. "Auditory-speech memory" may be acutely disturbed as a result of pathologically enhanced retroactive inhibition. The ensuing effects are abolished on transition to written reproduction of a series presented in printed or spoken form.—*I. D. London*.

6765. Milbury, Allen W. (Indiana U.) **What is the effect of a precision teaching program on the behavior of an adult trainable mental retardate?** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 656.

6766. Norman, Arthur & Broman, Harvey J. (Georgia Mental Health Inst., Atlanta) **Volume feedback and generalization techniques in shaping speech of an electively mute boy: A case study.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 463-470.—An electively mute 12-yr-old boy was successfully treated using positive reinforcement procedures. Visual feedback from the volume-level meter of a tape recorder was used to help in inducing sounds and to aid in raising speech volume. Various other techniques were employed in 44 sessions lasting from 30 min.—1 hr. to increase the rate of speech and to generalize it to a variety of environmental situations.—*Journal abstract*.

6767. Otsuka, Yoshitaka. [A family case with induced invocatory psychosis: II. Clinico-psychological study.] *Japanese Journal of Clinical Psychology*, 1968(Jul), Vol. 7(2), 115-127.

6768. Sefer, Joyce & Schuell, Hildred. (U. Minnesota) **A year of aphasia therapy: A case study.** *British Journal of Disorders of Communication*, 1969(Apr), Vol. 4(1), 73-82.—Presents the case study of a 48-yr-old female who showed severe aphasia reflected in all language modalities, complicated by partial or intermittent auditory imperception. Speech attempts often resulted in jargon; and groping movements of the articulators, forcing, and articulatory errors were observed. However, the presence of some connected speech that was well-articulated, natural, and fluent led to the postulation that this behavior resulted from loss of auditory, rather than somatosensory control.—*Journal summary*.

6769. Staal, A. & Bots, G. T. (State U., Inst. of Neurological Sciences, Leyden, Netherlands) **A case of hereditary juvenile amyotrophic lateral sclerosis complicated with dementia: Clinical report and autopsy.** *Psychiatria, Neurologia, Neurochirurgia*, 1969(Jan), Vol. 72(1), 129-135.—Examines a patient suffering from a slowly progressive juvenile amyotrophic lateral sclerosis, dementia complex of 27-yr duration. The healthy parents were 1st cousins. Inheritance was due to an autosomal recessive gene. Neuropathological investigation demonstrated a diffuse demyelination of the spinal cord, degeneration of the anterior horn cells and spinal ganglion nerve cells. The corpus callosum was extremely thin, with active demyelination; this was also found in the white matter beneath the motor cortex and in the internal capsule. Throughout the white matter of the brain and the cerebellum perivascular tissue degeneration was found. Difficulties in the classification of hereditary neurological diseases are discussed, and the arguments for the existence of a clinical and pathological continuum of hereditary neurological disorders are given. (20 ref.)—*Journal summary*.

6770. Stark, Joel; Meisel, Joan, & Wright, Teris S. (Queens Coll., City U. New York) **Modifying maladaptive behaviour in a non-verbal child.** *British Journal of Disorders of Communication*, 1969(Apr), Vol. 4(1), 67-72.—Describes some of the procedures employed to eliminate maladaptive, disruptive behavior, and to teach more appropriate responses to environmental stimuli with a nonverbal 3-yr-old boy who had normal hearing and was physically healthy. After 40 training sessions over a 6-mo period, during which time food and verbal praise were used as reinforcers, S progressed to the point where he would respond to verbal commands, imitate sounds, and discriminate objects and people in response to verbal stimuli. S was able to start a preschool program at a special children's center and was interacting with other children.—*M. Maney*.

6771. Thomas, Mary E. **Assessment and treatment of receptive and executive aphasia in identical twin boys.** *British Journal of Disorders of Communication*, 1969(Apr), Vol. 4(1), 57-63.—Summarizes an account of treatment, involving daily speech therapy for identical twin boys in a residential school, covering the years from 6 to school leaving age and a follow-up to 19 yr. of age. A method of training for cases of receptive and executive aphasia is described, showing the slow start and later development of the language learning process. Comparison and possible association with autism, deafness,

and other conditions is discussed. The added involvement of personality problems is considered and the results assessed accordingly.—*Journal abstract.*

6772. **Welman, A. J.** (State U., Neuropsychological Lab., Leyden, Netherlands) **Visual agnosia and asomatognosia as behaviour disorders.** *Psychiatra, Neurologia, Neurochirurgia*, 1969(Jan), Vol. 72(1), 153-160.—Describes a right-handed patient with a left-sided hemisindrome. S's behavior was disturbed, while he ignored the left side of the visual space and had no awareness of the left side of his body. After an improvement of some weeks S died. In the cortex and subcortex of the right hemisphere a pale soft infarction was found in the area between the end regions of the anterior cerebral artery, the middle cerebral artery, and the posterior cerebral artery. Some remarks are made about the symptoms and the short period of improvement before death occurred.—*Journal summary.*

MENTAL HEALTH & REHABILITATION

6773. **Albrecht, Gary L.** (Emory U.) **Adult socialization: The effects of aspiration and social interaction upon rehabilitation.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 823.

6774. **Bolton, B. F., Butler, A. J., & Wright, G. N.** **Clinical versus statistical prediction of client feasibility.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 7, 68 p.—Presents information about the important counselor function of evaluating a client's feasibility for rehabilitation, making the classic comparison of the clinical and statistical methods of predicting it. Feasibility was defined for the study as the counselor's prediction of the positive result of a client's receipt of vocational rehabilitation services. The statistical method of predicting rehabilitation feasibility was found significantly more accurate than the clinical one in this first attempt to analyze rehabilitation counselors' predictions of feasibility in an actual division of vocational rehabilitation setting. The importance of this study's analysis of the processes through which critical decisions are made daily about whether disabled persons receive rehabilitation services or not is obvious. Also, if a potential nonrehabilitant's probable rehabilitation outcome could be accurately estimated at the time he is accepted for services, it would be possible to then provide him with specialized services to meet his special needs and, hopefully, increase his potential for rehabilitation success.—*Journal abstract.*

6775. **Dumas, N. S., Butler, A. J., & Wright, G. N.** **Counselor perceptions of professional development.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 4, 46 p.—Identifies issues related to the professional development of rehabilitation counselors based on the perceptions of counselors themselves. 280 counselors working in Illinois, Indiana, Michigan, Ohio, and Wisconsin were surveyed and the responses of a random sample of those completing the "professional development" section of the instrument were interpreted. This included perceptions in the 6 areas of: counselor characteristics and qualifications; pre-, in-, and out-service training; journal and agency literature; consultation, information, and reference services; staff interaction and communication; and self-evaluation procedures. More than 1/2 of the counselors surveyed expressed a need for modifying the professional development activities now available to them. Their principal

concern was the need for innovation in the areas of research and development. Almost all of their recommendations require the generation of new information, new administrative control techniques, and a new system for analysis and decision-making. The need for a comprehensive information storage and retrieval system to organize, evaluate, and disseminate research data on demand was also recognized. The variable which seemed to discriminate best among the counselors in relations to their perceptions was the type and degree of their formal training, suggesting the need for more research in the area of the formal training counselors receive.—*Journal abstract.*

6776. **Dumont, Matthew P.** **Industrial psychiatry for the employer of last resort.** *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 411-417.—Describes problems that will be faced by supervisors, administrative officers, and personnel representatives if the federal government finds itself in the position of hiring large numbers of hard-core unemployed individuals. This will entail a major crisis for agencies accustomed to traditional personnel practices. A program of mental health consultation with concerns for the individual and the social system in which he works may be of help. An example of such a program in a federal agency is described.—*Journal abstract.*

6777. **Fullerton, John R.** (Pennsylvania State U.) **A factor analytic study of rehabilitation role perceptions reported by undergraduate rehabilitation students.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 607-608.

6778. **Gandy, Patrick & Deisher, Robert.** (U. Washington, Child Development & Mental Retardation Center) **Young male prostitutes: The physician's role in social rehabilitation.** *JAMA: Journal of the American Medical Association*, 1970(Jun), Vol. 212(10), 1661-1666.—50 male prostitutes were engaged in street conversation and 30 of these "hustlers" were interviewed for vocational counseling. The characteristics of the male prostitute are described. Several methods used to establish a workable relationship and key factors and techniques in approach and attitude are discussed. Many of these methods can be used before he engages in hustling. This effort at vocational rehabilitation lasted 15 mo. with a halfway house being utilized during the last 6 mo. "Efforts were generally unsuccessful with the individuals who had psychopathic personalities and with those hustlers who were very successful." The 30 youths who expressed interest in a job were eventually placed.—*B. A. Burkard.*

6779. **Hammond, C. D., Wright, G. N., & Butler, A. J.** **Caseload feasibility in an expanded vocational rehabilitation program.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 6, 56 p.—Focuses on the potential of vocational rehabilitation services to meet the needs of all handicapped people—including those with cultural disadvantages. The possibility of expanding rehabilitation services to include a wider range of handicapped persons without lowering the number of clients feasible for an agency's caseload was investigated. An experiment is described in which a traditional rehabilitation program was expanded by extending its eligibility criteria, i.e., in addition to the physically, emotionally, and mentally handicapped, those who were educationally, socially, and economically disadvantaged were eligible. Also included is an extensive review of the literature relating personal and

sociocultural variables to success in rehabilitation and allied areas. It is demonstrated that reliable instruments to measure general rehabilitation feasibility level can be developed and that similar instruments can be constructed to assess feasibility level for specific client handicap areas: emotional, intellectual, job skills, social, and motivational. It is also concluded that extending rehabilitation services to a larger number of handicapped people in a rural community does not decrease an agency's rehabilitation caseload feasibility. It is also indicated that culturally handicapped clients generally have higher levels of case feasibility than clients with whom rehabilitation personnel have traditionally been involved; the culturally disadvantaged clients were found to be "just as feasible."—*Journal abstract.*

6780. Klerman, Gerald L. (Yale U., Medical School) **Mental health and the urban crisis.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 818-826.—Examines the effect of the current urban crisis on mental health workers and institutions. Community consultation, emergency treatment, group therapy, and nonprofessional activities are growing in importance. Yet mental health institutions and programs are under attack from various factions in both the community and the profession.—*Journal abstract.*

(National Inst. of Mental Health, Chevy Chase, Md.) **Applications of mental health statistics: Uses in mental health programmes of statistics derived from psychiatric services and selected vital and morbidity records.** Geneva, Switzerland: World Health Organization, 1969. 112 p.

6782. McCarthy, Barry W. (American U.) **New approaches to mental health services in colleges and universities.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 420-422.—Advocates a concept of mental health emphasizing educational and developmental processes for college students. Focus is on prevention and development of positive functioning rather than on remediation. Innovative procedures being proposed or in preliminary stages of implementation are discussed.—*Journal abstract.*

6783. Minuchin, Salvador. **The paraprofessional and the use of confrontation in the mental health field.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 722-729.—Examines the effect of confrontation in the mental health field as creating some degree of crisis and having a "division of viewpoint and strategy within the ranks." The present crises are viewed as a struggle between the traditional and sociological approaches. The conflict is "inherent in the attempt to introduce paraprofessionals into the delivery of services while trying to maintain the traditional conceptualizations of mental illness." Improved training and credentialization techniques are discussed. It is concluded that confrontation is 1 means to induce change, but that the "static of undifferentiated, power-play confrontations" must be reduced to facilitate communication.—*G. Steele.*

6784. Parhon-Ștefănescu, Constanța & Ciurezu, T. **Evaluarea capacității de muncă în bolile psihice în perspectiva recuperării.** [Evaluation of the working capacity in psychical diseases viewed from the perspective of rehabilitation.] *Neurologia, Psihiatria, Neurochirurgia*, 1969(Jan), Vol. 14(1), 1-9.—Discusses the rehabilitation of psychical defectives, of particular interest at present in view of prospects opened by neuroleptic therapy and the large number of patients

who may benefit by the resumption of work. Valid rehabilitation presupposes not only the absence of symptoms, but also employability. In appraising a patient's potential working capacity, both his emotional state and the nature and possible stress of his projected employment must be considered. Realistic evaluation should be made during the patient's hospital stay of the level at which he can be expected to function and his possibilities for future compensation. (French, German, & Russian summaries) (20 ref.)—*English summary.*

6785. Reagles, K. W., Wright, G. N., & Butler, A. J. **A scale of rehabilitation gain for clients of an expanded vocational rehabilitation program.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1970, No. 13, 90 p.—Investigated the effects of rehabilitation services on rehabilitated clients, focusing on a comparison of the culturally-handicapped clients (who were being served under the extended eligibility criteria) and the medically-handicapped clients (those traditionally served by vocational rehabilitation agencies) to delineate any significant differences between the types of services needed by these 2 handicap groups. The development of a 20-item scale to measure "rehabilitation gain" is described, and rehabilitation client status and rehabilitation process variables that discriminate among different degrees of client gain are identified. The primary conclusion is that rehabilitation gain can be conceptualized as a single variable. Also, it was demonstrated that a scale to measure rehabilitation gain could be developed which could compare a client's satisfaction rehabilitation to his status after successful rehabilitation, yielding a score indicating the extent of impact of rehabilitation services.—*Journal abstract.*

6786. Reagles, K. W., Wright, G. N., & Butler, A. J. **Correlates of client satisfaction in an expanded vocational rehabilitation program.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1970, No. 12(Series 2), 72 p.—Describes 1 of a series of investigations assessing the impact of the vertical and horizontal expansion of rehabilitation services. It describes the development of a measuring scale to assess the satisfaction of clients with the rehabilitation services they receive, assuming this satisfaction to be an important aspect of rehabilitation outcome. Phase 2 identifies variables possibly discriminating among clients expressing varying degrees of satisfaction. The unique Scale of Client Satisfaction measures clients' perceptions of their emotional, occupational, and social characteristics, in addition to providing information related to their disabilities and satisfaction with rehabilitation services. Identification of correlates of client satisfaction showed that the intensity for intervention by the counselor in using agency resources to effect client closure was generally reflected in the client's expressed satisfaction with the rehabilitation services he received. Purchased services, measured by total cost of each case, were not related to a client's satisfaction. Generally, demographic and idiographic prerehabilitation status variables were not related to it, either, while process variables indicating "purposeful counselor contact" and postprocess client variables—especially those related to vocational status—were significantly related to client satisfaction.—*Journal abstract.*

6788. Richards, Hilda & Daniels, Marionette S. (Harlem Hosp. Center, Div. of Rehabilitation Services, New York, N.Y.) **Sociopsychiatric rehabilitation in a black urban ghetto: II. Innovative treatment roles and approaches.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 662-676.—Discusses the sociopsychiatric orientation and the "need to maximize human potential and to encourage the entry into more productive social systems of larger numbers of people." The systems approach is advocated. Psychiatric improvement, vocational, educational, familial, sociotherapeutic, medical, and community involvement is viewed as essential for total rehabilitation. Psychiatric, continuing, and vocational rehabilitation programs are included in the Harlem Rehabilitation Center of a black urban ghetto, illustrating the innovative approach to total rehabilitation. Group meetings, communal activities, and adjustment activities are emphasized. The team approach has proven particularly effective in dealing with crisis situations. (15 ref.)—G. Steele.

6789. Sather, W. S., Wright, G. N., & Butler, A. J. An instrument for the measurement of counselor orientation. *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 9, 54 p.—Discusses the development of a framework or model to measure the professional orientation of rehabilitation counselors. Results indicate that a reliable instrument to identify 4 distinct professional orientations of rehabilitation counselors—relationship, situation, bipolar, or neutral—could be developed. Also, discussed is the necessity of further refining and using this instrument for research on rehabilitation counselors. The issue that needs to be analyzed is how the 4 orientations affect the services provided by the counselors to their clients. Because rehabilitation involves more than just counseling, because it involves coordination of services also, these orientations must be studied in terms of their effectiveness in the rehabilitation process and agency setting in general and in serving specific client needs.—*Journal abstract*.

6790. Thoreson, R. W., Smits, S. J., Butler, A. J., & Wright, G. N. **Counseling problems associated with counselor characteristics.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 8, 46 p.—This report was 1 aspect of a large-scale study of rehabilitation counselors' perceptions of their roles and functions. It specifically concerned counselors' perceptions of their own characteristics which cause problems in counseling and vocational planning. The counselors reported 4 major areas which cause problems in their work: lack of knowledge and skills, imposition of their perceptions and goals on clients, lack of objectivity, and personality conflicts between counselors and clients. The problem mentioned most frequently—lack of knowledge and skills—was further broken down into more specific areas. Also, the major problem areas were analyzed in terms of counselor characteristics, such as age and experience.—*Journal abstract*.

6791. Thoreson, R. W., Smits, Stanley J., Butler, A. J., & Wright, G. N. **Counselor problems associated with client characteristics.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 3, 46 p.—Identifies professional problems rehabilitation counselors encounter which seem to be associated with various characteristics of their clients. An extensive review of the literature concerning client characteristics is also in-

cluded. Complementing the data on client characteristics, the study presents information relating the counselors' perceptions of client problems with attributes of the counselors themselves. The counselors reported that the chief barrier to effectively serving the client was the client's "lack of motivation for rehabilitation," an area further delineated into 3 psychological patterns of client problems. In addition, counselors reported problems of their clients' "unrealistic vocational goals," "undesirable personal characteristics," and the "low labor market demand" for the client's services. The counselors' employer (agency), education, age, and experience were significantly related to their perceptions of client problems. The major deterrent reported by the counselors to effective counseling was that of "time pressures"—the need to serve large numbers of clients, limiting the time available for each.—*Journal abstract*.

6792. Tosi, Donald J. & Vesotsky, Louis R. (Western Michigan U.) **Successful rehabilitation as a function of client status.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 37-38.—Investigated the relationship between client status and successful vocational rehabilitation. Clients defined in terms of disabled and disabled-disadvantaged differed with respect to successful rehabilitation. Disabled Ss evidenced a greater success rate than disabled-disadvantaged Ss.—*Journal abstract*.

6793. Trotter, Ann B., Wright, G. N., & Butler, A. J. **Research media.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 5, 62 p.—Develops and evaluates a uniform and consistent method of abstracting the results of vocational rehabilitation association sponsored research and demonstration projects. The need for improved communication of research results was investigated, and a means of presenting information in a concise and readable way about this potentially valuable but presently relatively unexplored source of rehabilitation information is described. It was found that uniform research and demonstration project abstracts were a more effective medium for communicating rehabilitation information than were summaries of the vocational rehabilitation association projects. A secondary hypothesis—practicing rehabilitation counselors are able to assess the contents of abstracts as well as rehabilitation researchers and educators—was supported.—*Journal abstract*.

6794. Wade, Ruth; Jordan, Garland, & Myers, George. (Harlem Hosp. Center, Div. of Rehabilitation Services, New York, N.Y.) **Sociopsychiatric rehabilitation in a black urban ghetto: III. The view of the paraprofessional.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 677-683.—Discusses the recruitment, training, and role of the paraprofessional in the Harlem Rehabilitation Center in a black urban ghetto. The 4-wk training program encompassed in-depth coverage of all aspects of multiservice rehabilitation and aided in establishing increased communication between professionals, paraprofessionals, and members. Illustrations of practical applications are presented.—G. Steele.

6795. Waggoner, Raymond W. (U. Michigan, Neuropsychiatric Inst.) **The presidential address: Cultural dissonance and psychiatry.** *American Journal of Psychiatry*, 1970(Jul), Vol. 127(1), 1-8.—Discusses broad social issues of the times, i.e., overpopulation, racism, the nuclear threat, with a view toward establishing some understanding of these problems from which appropriate remedies can be developed. With regard to deper-

sonalization and alienation of the patient-doctor relationship, a shift in the field of psychiatry toward humanization and personal contact is called for. It is further recommended that: (a) the Commission on the Delivery of Mental Health Services be continued for at least 5 yr., (b) a training program for potential parents of high school and college students be developed, (c) counseling centers for parents seeking advice be established, (d) the establishment of a Presidential Advisory Council on Children be urged on all concerned, and (e) a new institution along the lines of the Joint Commission on Mental Illness and Health be established to pick up where the Commission left off. The general thesis of the address is directed toward preventative psychiatry, particularly in the young. A response by R. S. Garber follows.—*P. R. Shibelski.*

6796. Wiley, E. David. (Dept. of Mental Hygiene, Albany, N.Y.) **Review of mental hygiene and related legislation for the year 1968.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 124-143.—The New York State Legislature in 1968 passed 7 out of 8 Department of Mental Health program bills. "25 bills amending the Mental Hygiene law were passed, and 18 of these were approved by the Governor and 6 vetoed. This Legislature gave considerable attention to legislation for children, medicaid, health and social services.—*D. Prager.*

6797. Wright, G. N. & Butler, A. J. (U. Wisconsin, Rehabilitation Research Inst.) **Rehabilitation counselor functions: Annotated references.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 1, 460 p.—Presents annotated references to published works dealing with the roles and functions of rehabilitation counselors, with an interpretative review for each title. References were selected for their relevance to the vocational rehabilitation counseling process; only documents published after 1965 are included. (1412 ref.)—*Journal abstract.*

6798. Wright, G. N., Smits, S. J., Butler, A. J., & Thoreson, R. W. (U. Wisconsin, Rehabilitation Research Inst.) **A survey of counselor perceptions.** *Wisconsin Studies in Vocational Rehabilitation Monograph*, 1968, No. 2, 73 p.—Describes the problems rehabilitation counselors encounter in delivering rehabilitation services—barriers to effective professional efforts as perceived by the counselors themselves. Presented is a brief overview of the results of a survey of 58 counselors in a 5-state region (Illinois, Indiana, Michigan, Ohio, and Wisconsin), along with the raw data obtained from the instrument used in the survey. The major problems the counselors indicated included their clients' lack of motivation for rehabilitation, unrealistic vocational goals, undesirable personal characteristics, unrealistic attitudes toward employment procedures, and physical appearance. The most frequently reported ways in which counselors saw themselves responsible for problems in the rehabilitation process were in their lack of objectivity, lack of knowledge or skills, and in their tendency to impose their own perceptions and goals on their clients. Large caseloads and pressures for closures, too much clerical work, and agency policies and procedures were perceived by the counselors as problems created by the agency. Outside the agency, problems created by the community were described as lack of understanding, apathy, and lack of diagnostic, training, and medical facilities.—*Journal abstract.*

COUNSELING & GUIDANCE

6799. Cunningham, Louis M. (Ohio State U.) **Approaches to counseling/psychotherapy: A selected examination for school counselors.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), '607.

6800. Farnsworth, Dana L. & Braceland, Francis J. (Eds.) (Harvard U., Health Services) **Psychiatry, the clergy and pastoral counseling: The St. John's story.** Collegeville, Minn.: St. John's U. Press, 1969. xviii, 356 p. \$6.50.—Chapters by various authors portray clinical aspects of behavior of interest to the clergyman, including techniques of pastoral counseling, crisis intervention, emotional problems of children and adults, changing sexual expectations, marital counseling, and chapters on drugs, suicide, depression, and alcoholism.

6801. Glick, Morley D. (St. Cloud Hosp., Minn.) **A rational approach to short-term counseling.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Nov), Vol. 6(6), 336-338.—Examined the use of the rational approach to short-term counseling developed by A. Ellis (see PA, Vol. 37:1437). The counselor attempts to: (a) isolate the patient's irrational ideas which effect his disturbed behavior, (b) challenge the irrational sentences so that the illogical thinking will become apparent to the patient, and (c) help the patient cope with his difficulties by teaching him to logically think through his problems. The approach was found to be successful in 80-90% of cases faced by mental health workers. It is concluded that this approach should be used by hospital counselors with short-term cases as it aims to change behavior in a brief time period.—*M. Daniels.*

Social Casework

6804. Bradford, Kirk A. (Los Angeles County Department of Social Services, Calif.) **Existentialism and casework: The relationship between social casework theory and the philosophy and psychotherapy of existentialism.** New York, N.Y.: Exposition Press, 1969. 82 p. \$4.50.

6805. Conrad, Gertrude. **Short-term casework treatment of obesity in two young women.** *Israel Annals of Psychiatry & Related Disciplines*, 1969(Nov), Vol. 7(2), 179-184.—Distinguishes the common characteristics in case studies of 2 obese 19- and 29-yr-old females as denial of sexuality, parental conflicting messages, masochism, dependency, and lack of normal adolescence.

During short-term treatment, the role of the social worker "was to act as a catalyst, and to help these young women attain the more mature status toward which they had already made much progress on their own."—G. Steele.

6806. Fox, Evelyn F., Nelson, Marian A., & Bolman, William M. (Central Wisconsin Colony, Developmental Evaluation Center, Madison) **The termination process: A neglected dimension in social work.** *Social Work*, 1969(Oct), Vol. 14(4), 53-63.—A review of the social work and child psychiatry literature revealed an absence of attention to the termination phase of therapy. It is suggested that this gap reflects the social worker's defensive processes against the affects involved in termination, i.e., grief over the loss, anger at the worker for leaving, and narcissistic wounds based on disappointed expectations. 3 phases in the management of these affects are discussed: denial of the impending loss; emotional reaction and expression of sadness, hurt, and anger; and working through of these feelings. A clinical example of a 12-yr-old girl is presented, based on observations during 5 therapy sessions which point up the important aspects of the process, the client's feelings, and the worker's problems in helping the client work through to termination.—*Journal summary*.

PHYSICAL HANDICAP

6807. Cull, John G. & Colvin, Craig R. (Virginia Commonwealth U.) **Correlation between the Quick Test (QT) and the WAIS Verbal scale in the rehabilitation setting.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 105-106. Administered the Quick Test and the WAIS Verbal scale to 30 severely physically handicapped persons in a physical medicine and rehabilitation hospital. There was no significant difference between the mean IQ scores of the QT and the WAIS Verbal scale. This, coupled with a correlation of .80, supports the hypothesis that the QT can be utilized for a quick assessment of intellectual functioning in the rehabilitation setting.—*Journal abstract*.

6808. Etkes, Asher B. (Playground Corp. of America, Long Island City, N.Y.) **Planning playgrounds for the handicapped.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Nov), Vol. 6(6), 339-343.—Discusses considerations in designing play areas for handicapped children that would improve the efficacy of recreation in the rehabilitation process. The use of self-directed play with minimal supervision is suggested with design "...based upon studies of children's behavioral characteristics, their energetic and imaginative natures and an awareness of their short spans of interest and need for successful play experiences."—M. Daniels.

Blindness & Visual Disorder

6809. Barraga, Natalie C. (U. Texas, Coll. of Education) **Learning efficiency in low vision.** *Journal of the American Optometric Association*, 1969(Aug), Vol. 40(8), 807-810.—Discusses the importance of considering the total visual system in understanding learning problems of persons with low vision. It is suggested that enhancing visual behavior in preschool children might be accomplished by programs of planned stimulation and learning through the visual system. A particular experimental program for progressive training is outlined, detailing the

stages in visual discrimination, and sequence of activities. (20 ref.)—P. McMillan.

6810. Foulke, Emerson. (U. Louisville, Non-Visual Perceptual Systems Lab.) **The development and testing of the caster cane.** *New Outlook for the Blind*, 1969(Oct), Vol. 63(8), 247-250.—Describes a program which attempts to develop the "ability to measure total mobility performance over a standardized course that confronts the S who moves through it with a broadly representative sample of the problems that must be solved by a blind cane traveler." The caster tip was developed because it was reasoned that "if surface characteristics could be monitored continuously, the cane traveler might be able to obtain useful information that is apt to be missed with an ordinary cane used in the ordinary way." The caster cane was sent to 3 institutes for the blind where it was tested and its assets and liabilities evaluated.—B. A. Burkard.

6811. Hartlage, Lawrence C. (Veterans Administration Hosp., Indianapolis, Ind.) **Deficit in space concepts associated with visual deprivation.** *Journal of Learning Disabilities*, 1968(Nov), Vol. 1(11), 649-651.—Used a spatial relationship test to measure a deficit in space concepts associated with visual deprivation in a comparison of 50 2nd, 3rd, 5th, 7th, and 12th grade children blind from birth and 50 sighted Ss matched for age, sex, and achievement test scores. Significant differences were found between blind and sighted Ss on spatial relationships, but not on other base-line measures. It is suggested that the development of spatial abilities is dependent on visual experience.—*Journal abstract*.

6812. Mehr, Edwin B. & Mehr, Helen M. **Psychological factors in working with partially sighted persons.** *Journal of the American Optometric Association*, 1969(Aug), Vol. 40(8), 842-846.—Discusses the emotional and attitudinal aspects encountered in the treatment of persons with low vision. It is noted that both optometrist and patient can be subject to potentially negative psychological "sets": (a) the optometrist may feel nothing more can be done and that optical aids may be rejected anyway, and (b) the patient may feel depression or self-recrimination following sudden or recent vision loss. The optometrist can benefit from the assistance of the patient's family, teachers, and mental health professionals in dealing with these problems. 2 illustrative case studies are presented.—P. McMillan.

6813. Novomeiskii, A. S. (Pedagogical Inst., Sverdlovsk, USSR) **Obuchenie slepykh raspoznavaniyu tsveta s pomosh'yu kozhnoi chuvstvitel'nosti.** [Teaching the blind to recognize color by means of dermal sensitivity.] *Spetsial'naya Shkola*, 1969, No. 1, 77-84.—Reports results of experiments with selected blind children, showing that it is possible to train these children to use their hand to recognize color tones on paper either by touching the paper or with the hand held away from the surface.—I. D. London.

6814. Pasnak, Robert & Ahr, Paul. (Catholic U. of America) **Tactual Poggendorff illusion in blind and blindfolded subjects.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 151-154.—Presented tactual Poggendorff illusions to 11 blind and 19 blindfolded normal 17-21 yr. old Ss according to the method of constant stimuli. The reports of both groups showed small illusions which did not differ significantly in magnitude. Results indicate that sensory experience per se is probably not an important determinant of the

illusion's magnitude since the greater experience of the blind Ss should produce a smaller illusion. The equivalence of the illusions obtained for the 2 groups argues against receptor sensitivity as an important factor. Theoretical explanation of illusions should rely on central mechanisms and not the visual system.—*Journal abstract.*

6815. Požár, L. (Comenius U., Bratislava, Czechoslovakia) **Vremya reaktsii u tupoglaznykh detey.** [Response time in amblyopic and strabismic children.] *Studia Psychologica*, 1970, Vol. 12(2), 112-119.—Recorded response time to a light stimulus in 83 10-11 yr. old students. Ss were given a ophthalmological and neurological check-up and divided into 3 groups according to the degree of amblyopia, and into 2 groups according to their neurological findings. Although the mean response time in the amblyopic eye was longer than that in the normal eye, the difference was not of statistical significance; neither were such differences significant when measured in monocular and binocular fixation. Groupings according to neurological findings proved to be of great value. Ss with a positive neurological finding, with a probable such finding, and those with a minimum cerebral dysfunction were assigned to 1 group and their results differed considerably from those of other Ss. It is concluded that any experimental work with amblyopic and strabismic children should be preceded by a neurological examination, and all those with a positive finding should be assigned to a separate group.—*English summary.*

6816. Riley, Leo H. **Low vision statistics.** *Journal of the American Optometric Association*, 1969(Aug), Vol. 40(8), 820-826.—Discusses problems of definition and measurement in considering the prevalence of low vision in the United States population. Estimates range from 90,000,000 with ocular defects to approximately 300,000 cases of legal blindness. It is felt that the National Health Survey figure of 1,227,000 persons with severe visual impairments represents the most meaningful figure in estimating low vision. Problems in interpretation of the prevalence data are considered. (22 ref.)—*P. McMillan.*

6817. Rosenberg, Robert & Werner, D. Leonard. (Optometric Center of New York, Low Vision Clinic, N.Y.) **Nystagmus and low vision.** *Journal of the American Optometric Association*, 1969(Aug), Vol. 40(8), 833-835.—Considers problems encountered in the optometric management of a patient with nystagmus. Impaired visual acuity often accompanies this condition. It is noted that patients with nystagmus are more often treated for the cosmetic aspects of this condition, involving involuntary movements of the eyes, than for the more important need of improving their visual acuity. The role of magnification in the diagnosis and treatment planning of the low vision patient with nystagmus is reviewed.—*P. McMillan.*

6818. Smith, Marguerite A., Chethik, Morton, & Adelson, Edna. (U. Michigan) **Differential assessments of "blindisms."** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 807-817.—Examines the etiology and psychological significance of "blindisms" which refers to repetitive or bizarre behaviors occurring in the blind population. A longitudinal study of 3 infants blind from birth offers examples of adaptive, transitory, and pathologically fixated blindisms with etiology comparable to related behaviors in sighted children. (18 ref.)—*Journal abstract.*

6819. Terekhov, V. A. (Moscow State U., USSR)

Issledovanie évristik. [Research on heuristics.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 31-36.—Reports results of a study on the problem-solving activity of blind chess players, where the tactile "search activity" of the player in the solution of the mental problems involved is seen as (a) serving not so much perceptual as intellectual functions, and (b) exteriorizing such components of thinking activity as "the comparison of the situational change with the hypotheses of the chess player, the discovery of the opponent's ideas, and the planning of next moves." Light is cast on the factors leading to shortcuts in the quest for information, i.e., on the heuristic activity involved in problem solving.—*I. D. London.*

6820. Wheeler, Jane G. (Inst. of Rehabilitation, Industrial Home for the Blind, Jamaica, N.Y.) **A practical knowledge of color for the congenitally blind.** *New Outlook for the Blind*, 1969(Oct), Vol. 63(8), 225-231.—Presents a method giving congenitally blind persons a knowledge of color using "words and concepts already in his frame of reference from previous experience" or those than can be demonstrated. Association, incorporation, and retention allow S to learn about color. Dimensions of hue, value, and intensity are discussed, emphasizing the use of primary and secondary colors in the formation of others and the feeling associated with each. A description of the "personalities" of colors for use with children is included.—*G. Steele.*

Deafness & Hearing Disorder

6821. ———. **Directory of services for the deaf in the United States.** *American Annals of the Deaf*, 1970(May), Vol. 115(3), 97-452.

6822. Allende Navarro, Fernando. **La prueba de Rorschach en sordomudos: I. Breve introducción y reminiscencias a la investigación en sordomudos por el método de Rorschach.** [The Rorschach test in deaf-mutes: I. Brief introduction and reminiscences on the investigation of deaf-mutes by the Rorschach method.] *Revista de Neuro-Psiquiatria*, 1969(Sep), Vol. 32(3), 153-160.—Describes preliminary experiences accompanying an experiment begun in collaboration with Rorschach in 1922. The relation of these experiences to tests, observations, and notes gathered in latter investigations is discussed.—*P. Hertzberg.*

6823. Allende Navarro, Fernando & Aliaga, Pedro. **La prueba de Rorschach en sordomudos: II. Estudio de cinco niños y diecinueve adolescentes sordomudos.** [The Rorschach test in deaf-mutes: II. Study of five deaf-mute children and nineteen deaf-mute adolescents.] *Revista de Neuro-Psiquiatria*, 1969(Sep), Vol. 32(3), 161-179.—Describes the testing of 24 11-16 yr. old deaf-mutes, considering 3 major factors: (a) rapport with the Ss, (b) cultural background, and (c) the influence of global circumstances on the psychological traits of the Ss. 5 kinds of apperception were distinguished: (a) response to global environment, (b) normal detail, (c) minute detail, (d) oligophrenic detail, and (e) interpretation of a part of white background. Responses were analyzed regarding the age of the S and were compared to those of B. Serebrinsky. It was generally found that (a) apperception of normal and minute detail increased, indicating an interest in the concrete and practical as well as in the superfluous in a negative sense and in acute observation in a positive sense; (b) associate processes, attention span, and capacity for concentration tended to

diminish; (c) monochromatic responses indicated an inhibition of primary affective reactions, incompatible with normal ego development; and (d) an increase of human responses indicated a preoccupation with the S's own person. (English, French, & German summaries)—P. Hertzberg.

6824. Blegvad, B. (University Hosp., Audiological Lab., Copenhagen, Denmark) **Differential intensity sensitivity and clinical masking.** *Acta Oto-Laryngologica*, 1969(Apr), Vol. 67(4), 428-434.—Examined 32 25-74 yr. old patients with unilateral perceptive hearing loss to determine whether masking of the good ear influences the DL of intensity. The measurements were made with the aid of the Short Increment Sensitivity Index (SISI) procedure using increments of different magnitudes, until the psychometric function was determined both without and with masking (80-db SPL). The level of the test tone was maintained constant (20 db. above the threshold determined without masking). At 1000 and 4000 cps, the contralateral noise resulted in a significant improvement in the intensity discrimination, while no change occurred at 250 cps. With a few exceptions, the masking had no significance for the result of the topognostic SISI test using 1 db. increments. (German summary) (15 ref.)—*Journal abstract*.

6825. Byers, Vincent W. (Louisiana State U., Medical Center, New Orleans) **Speech therapy for the learning disabled child.** *Journal of Learning Disabilities*, 1969(Jul), Vol. 2(7), 363-367.—Describes 2 functions of the ear: 1 while the individual is talking, the other while he is listening. The understanding of the differences is important for the clinician engaged in speech therapy with the hearing impaired child. A therapy program is outlined, utilizing the proprioceptive and tactile mechanisms as primary source information with the auditory as secondary, for the correction of defective articulatory sounds in hearing impaired children with learning problems.—*Journal summary*.

6826. Chovan, William L. (Western Carolina U.) **Vocal mediating responses in short-term memory of severely and profoundly deaf children.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 539-544.—15 young severely and 15 profoundly deaf children served as Ss. The purpose was to determine to what extent vocal responses are dependent upon auditory stimulation on recall, on 3 different tasks. Findings suggest that whether vocal responses were effective mediators for the deaf depended upon the meaningfulness of stimulus material and the amount of attention directed to the verbal act. Where considerable effort had to be extended to the expressive functions, it seemed to be at the expense of effective sensory input; vocal responses by the severely deaf appeared to be more interfering than facilitating on visual-memory tasks. (17 ref.)—*Journal abstract*.

6827. Clack, T. D. & Bess, F. H. (U. Michigan, Medical School, Kresge Hearing Research Inst.) **Aural harmonics: The tone-on-tone masking vs. the best-beat method in normal and abnormal listeners.** *Acta Oto-Laryngologica*, 1969(Apr), Vol. 67(4), 399-412.—Describes 2 experiments which demonstrate the similarity between the harmonic and the masking threshold. In Exp. I, with 5 22-33 yr. old undergraduates, the thresholds of masking at 1 octave above the fundamental (1000 Hz.) and the 2nd harmonic thresholds were shown to be within a few db. sound level (SL) of each other in normal ears. Both techniques tend to rank the 2 ears of the same listener in a similar way. Exp. II showed that

the masking thresholds of 8 sensorineural impaired patients were lower than for 8 normal-hearing undergraduates. Also, the mean masking threshold of the abnormals, 26-db SL, is within the range of harmonic thresholds, 13-30 db. SL, reported by previous investigators. Results indicate that the diagnostic information obtained by the tone-on-tone masking technique is equivalent to the harmonic thresholds measured by the best-beat method. The masking procedure is simpler and quicker than the best-beat method and more practical for clinic use. (German summary)—*Journal abstract*.

6828. Harbert, F., Young, I. M., & Weiss, B. G. (Jefferson Medical Coll. Pa.) **Clinical application of intensity difference limen.** *Acta Oto-Laryngologica*, 1969(Apr), Vol. 67(4), 435-443.—Administered the Short Increment Sensitivity Index (SISI) tests at various SPLs in normal and pathologic Ss. When the inner ear received an audible signal of 60 db. SPL or greater, a positive SISI score occurred in both normal and sensorineural hearing losses except in those with abnormal adaptation. A negative SISI score in the absence of a conductive barrier occurred only in abnormally adapting ears and is probably indicative of supra-threshold adaptation. Data indicate that recruiting ears and normal ears perceived intensity increments of equal size at equivalent SPL. In abnormally adapting ears, as Békésy separation increases, the increment tends to become larger than normal. Continuous tone Békésy thresholds measured at the bottom of the 1st spike increased directly with starting intensity and inversely with attenuation rate. Variations of the SISI test and Békésy audiometry are proposed. (German summary) (25 ref.)—*Journal abstract*.

SPEECH DISORDER

6829. Chudinova, L. M. (Inst. of Defectology, Moscow, USSR) **Nachal'nye etapy obucheniya rechi detei s sensornoi afaziei.** [Beginning stages in teaching speech to children with sensory aphasia.] *Spetsial'naya Shkola*, 1969, No. 1, 120-125.—Describes 3 stages, corresponding temporally with the 1st yr. of speech training. Practical recommendations are made and illustrated.—J. D. London.

6830. Hood, Stephen B. (U. Wisconsin) **Investigation of the effect of communicative stress on audible, inaudible and avoidance-escape components in stuttering.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 946.

6831. Ostwald, Peter F. (U. California, Medical School, San Francisco) **Psychiatric evaluation and treatment of patients with major speech handicaps.** *California Mental Health Research Monograph*, 1969, No. 10, 60 p.—Reports a pilot study exploring the development of mental health services for speech-handicapped, deaf, and language-deprived persons. Tables are presented providing information on the referral source, education, occupation, nature of the disorder, diagnosis, and management efforts for 32 male and 12 female patients. It is concluded that: (a) speech disturbance is a generic diagnosis; (b) normality of speech cannot be determined by studying an isolated dimension, as speech is part of a larger social process; (c) the majority of speech patients are not referred to psychiatrists, who only see the most severe cases; (d) patient-management

involves reliance on all available methods for rehabilitation and requires coordination by clinically experienced individuals; (e) individual and group psychotherapy should be selectively used; (f) basic research into all levels from neurophysiology to sociology is necessary for progress in managing the speech handicapped person; and (g) professional training in this field should begin early. (78 ref.)—*P. McMillan.*

6832. Ryabova, T. V. (Moscow State U., USSR) **K psikholingvisticheskomu analizu rechi bol'nykh dinamicheskoi afaziei.** [On the psycholinguistic analysis of speech in cases of dynamic aphasia.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 117-124.—Studied the grammatical structure of speech in a case of dynamic aphasia (gross disorder of speech employing full sentences, with relative preservation of sensory and motor components), in order to get closer at the mechanisms involved in the disorder, and develop means for the restoration of speech in such cases. In dynamic aphasia "disturbances of combination at the level of words and sentences" were observed—disturbances connected with the loss of appropriate models. For this reason, it is easy to understand why replies to questions are comparatively easy, since the former utilizes the model contained in the latter. Combinatorial disturbances, being at the same time "disturbances of successive syntheses," unites dynamic aphasia with other forms of disorders characteristic of the premotor syndrome, and efferent motor aphasia especially. If efferent motor aphasia with marked "telegraphic style" is viewed as a disorder involving the combination of syllables, words, and sentences, then dynamic aphasia, while close to this form of speech pathology, does differ from it when the level of disturbance is considered, since in dynamic aphasia there are no disturbances of lower order—"disorders in the actualization of syllabic motor programs."—*I. D. London.*

D. London.*

6839. Bersnev, V. P. (Research Neurosurgical Inst., Leningrad, USSR) **Izuchenie regeneratsii nerva po dannym krivoi "intensivnost'-dлитel'nost'."** [Study of nerve regeneration according to the data of the "intensity-duration" curve.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 365-369.—The response of muscles to electrical stimulation of different "intensity-duration" curves for 75 patients were investigated monthly over a time period from several hr.-5 yr. after lesion, i.e., from the time of rejoining of the nerve until the reestablishment of voluntary movements. Findings are detailed. (English summary) (26 ref.)—*I. D. London.*

6840. Brown, George W. (Lovelace Clinic, Albuquerque, N.M.) **Suggestions for parents.** *Journal of Learning Disabilities*, 1969(Feb), Vol. 2(2), 97-106.—Describes how children suffering from neurological disabilities of behavior, attention, and learning can benefit from (a) understanding of the child as an individual, (b) structuring of the environment, (c) setting of good examples and high standards, (d) providing firm but loving control, and (e) providing opportunities for success and for the development of self-esteem. Some specific suggestions in these areas are provided.—*S. Appelle.*

6841. Burgess, Michael M., Kodanaz, Altan, & Ziegler, Dewey K. (U. Missouri, Kansas City) **Prediction of brain damage in a neurological population with cerebrovascular accidents.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 595-601.—Examined a total of 15 intellectual and 12 sensory-motor variables as predictors of brain damage in a neurological population with cerebrovascular accidents. Results obtained via Student's t tests and multiple regression analyses demonstrate that it is possible to predict brain damage significantly in this clinical population. It is concluded that: (a) as single predictor variables, sensory-motor measures are superior to intellectual measures; (b) brain damage as measured behaviorally is consistent across patient populations in neurological, psychiatric, and subgroups with cerebrovascular accidents (CVA); and, (c) multiple variant prediction holds promise for diagnosis of brain damage in CVA population. (15 ref.)—*Journal abstract.*

6842. Cleeland, Charles S., Matthews, Charles G., & Hopper, Cornelius L. (U. Wisconsin, Medical School)

MMPI profiles in exacerbation and remission of multiple sclerosis. *Psychological Reports*, 1970(Oct), Vol. 27(2), 373-374.—Reports profile analysis of MMPI profiles generated by 30 20-67 yr. old patients displaying exacerbation (E) or remission (R) of the symptoms of multiple sclerosis. Profiles classified as abnormal were significantly more frequent in the E group. Significantly more E Ss had elevations on the Depression scale greater than 70. The ordering of elevations of the clinical scales was similar in both groups.—*Journal abstract*.

6843. Drachëva, Z. N., Yablokova, M. S., & Litvinenko, N. I. (Medical Inst., Kiev, USSR) **Lopatochno-peroneal'naya amiotrofiya kak odna iz form progressivnoi myshechnoi distrofii.** [Scapulo-peroneal amyotrophy as one of the forms of progressive muscular dystrophy.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 337-341.—Presents a report based on clinical studies of 5 cases with disorders of the neuromuscular apparatus. Scapulo-peroneal amyotrophy should be viewed as a form of progressive muscular amyotrophy and not as a form of neuralgic amyotrophy. (English summary) (15 ref.)—*I. D. London*.

6844. Faurbye, Arild. (St. Hans Hosp., Roskilde, Denmark) **The structural and biochemical basis of movement disorders in treatment with neuroleptic drugs and in extrapyramidal diseases.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 205-225.—Studies the movement disorders produced by neuroleptic drugs and by brain diseases. The movement disorders occur by interference with transmitters in the synapses or as a result of toxic effect on nervous tissue. It ought to be possible to develop new neuroleptic drugs with good antipsychotic effect and little or no toxic effect on nerve tissue because there is no parallel between these 2 qualities. (104 ref.)—*D. Prager*.

6845. Kudashov, N. I. (Inst. of Pediatrics, Moscow, USSR) **Klinika i patogenez vegetativno-nervnykh narushenii pri gripe u detei.** [Clinical picture and pathogenesis of autonomic nervous disturbances in gripe in children.] *Pediatrics*, 1970, Vol. 49(1), 42-47.—Observed 101 children suffering from the gripe. In the period of initial toxicosis, dysfunction of both divisions of the autonomic nervous system was observed along with a short period of predominance of sympathetic reactions. Parasympathetic reactions with signs of asthenia (2nd period of the illness) were accompanied both by disturbance of cholinergic reactions with increase in acetylcholine level and by inhibition of adrenergic reactions with decrease in the sympathomimetic properties of the blood. In this period cholinesterase activity was at the lower limit of the normal, while the level of the inhibitors of acetylcholine increased. During the period of recovery, complete normalization of the clinical indices of autonomic functions, and the level of neurohumoral substances did not occur.—*I. D. London*.

6846. Lansdell, H. (National Inst. of Neurological Diseases & Stroke, Surgical Neurology Branch, Bethesda, Md.) **Relation of extent of temporal removals to closure and visuomotor factors.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 491-498.—Factor analysis of scores for 159 Ss on the Wechsler-Bellevue Scale of Intelligence, Mooney's Closure Faces Test, and a visuomotor task (in which 4 blocks were assembled 10 times alternately into square and triangular frames) yielded 3 similar factors for each sex: verbal comprehension, visual construction, and closure. Mean factor

score estimates showed the expected verbal deficit in 7 Ss with left temporal removals and closure deficit in 14 Ss with right temporal removals, but no asymmetry for the visuomotor factor. The negative correlation of the latter scores with extent of surgery in the right temporal area was different from the positive 1 found for the left temporal group. (23 ref.)—*Journal abstract*.

6847. Lekar', P. G., et al. (Hygienic Medical Inst., Leningrad, USSR) **O roli punktsionnoi biopsii pecheni v diagnostike hepato-tserebral'nykh zabolevaniy.** [On the role of hepatic puncture biopsy in the diagnosis of hepatocerebral diseases.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 345-351.—26 patients with chronic hepatitis and cirrhosis of the liver and 5 patients with hepatolenticular degeneration were Ss. The degree of neurological disorders as a function of (a) the functional state of the liver, and (b) the character of the morphological changes was studied. Findings are detailed and discussed from the viewpoint of differential diagnosis. (English summary) (21 ref.)—*I. D. London*.

6848. Makarova, L. G. & Gurskaya, N. Z. (Inst. of Neurology, Moscow, USSR) **Izmenenie elektricheskoi aktivnosti mozga pri bolezni Fridreikha.** [Alteration of cerebral electrical activity in Friedreich's disease.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 370-376.—Describes a clinico-EEG analysis of 34 cases of Friedreich's ataxia. Ss were 14-50 yr. old and suffered from Friedreich's disease from 3-30 yr. Spontaneous EEGs and cerebral bioelectrical reactions to trigger photic stimulation were recorded. In all cases, changes were observed in the development of the bioelectrical processes, expressed in (a) different degrees of changed alpha activity including its absence, (b) weakening of beta activity, (c) the sharp waves (irregular as a rule), and sequence of slow waves of the theta rhythm. Trigger photic stimulation accentuates the changes displayed in the spontaneous EEG. The character of EEG deviations from normality and the topographical distribution of pathological forms of activity suggest that involved in the pathological process are the brainstem-diencephalic structures. Degenerative changes in the cerebellospinal pathways disturb considerably the electrogenesis of the cerebrum. The disturbances of bioelectrical activity provide evidence for a decrease of tonus in the cortical structures and activating reticular system of the brainstem. (English summary) (26 ref.)—*I. D. London*.

6849. Margerison, J. H., Binnie, C. D., & McCaul, I. R. (St. Bartholomew's Hosp., London, England) **Electroencephalographic signs employed in the location of ruptured intracranial arterial aneurysms.** *Electroencephalography & Clinical Neurophysiology*, 1970(Mar), Vol. 28(3), 296-306.—Of a consecutive series of 133 patients with spontaneous subarachnoid hemorrhage, 70 had ruptured intracranial aneurysms identified by angiography, at craniotomy or at autopsy. EEG studies were made on which predictions were based, without contamination from clinical or radiological sources, as to the anatomical sites of the leaking aneurysms. It is concluded that if EEG investigations are started shortly after bleeding, lesions can be reliably located. Results are presented in respect of the 35 EEG criteria derived from an original 180 possible observations/tracing. These EEG features, detailed for 6 anatomical sites of ruptured aneurysm, should enable the clinical electroencephalographer to afford practical assistance, of known reliability, to the neurosurgeon.

Results support a general contention that the human capacity for pattern recognition has not yet been adequately exploited in clinical electroencephalography. (French summary) (25 ref.)—*Journal summary*.

6850. Miller, Donald L. (1143 5th Ave., New York, N.Y.) **Kleine-Levin syndrome: An atypical case.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 26-35.—In sharp contrast to all previous cases this 21-yr-old male patient appeared to be quite seriously ill. A mixture of psychological and physiological stressors precipitated an attack of hypersomnia, megaphagia, activated sexuality, and an altered state of consciousness with both organic properties and a strong indication of secondary gain in a borderline young man. It is hoped that it will be possible to study future patients with this disorder in prolonged intensive psychotherapy, with specialized psychological testing during and between episodes, and with the help of advanced sleep techniques.—*D. Prager*.

D. London*.

6852. Ponomareva, E. D. (Central Inst. for Advanced Medical Training, Moscow, USSR) **O redkikh formakh ostrogo leikoza s porazheniem pozvonochnika i nervnoi systemy.** [On rare forms of acute leucosis with lesion of the spine and nervous system.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 357-362.—Presents observations of 3 cases of acute hemocytoblastosis with lesion of the spine, and spinal disorders. Neurological symptoms discussed were headaches, and engirdling pain in the thorax and spine with irradiation into the lower extremities. Anatomohistological and medical findings are detailed. (English summary)—*I. D. London*.

6853. Rudnev, V. A. (Medical Inst., Krasnoyarsk, USSR) **Vosstanovlenie dvigatel'noi funktsii u bol'nykh s ostatochnymi yavleniyami porazheniya tsentral'nykh dvigatel'nykh putei metodom ritmizirovannoi trenirovki so zvukovym i svetovym podkrepleniem.** [Restoration of the motor function in patients with residual symptoms of lesion of central motor pathways by means of rhythmic training with acoustic and photic reinforcement.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 361-365.—Presents details of a new method for restoration of walking by means of "exogenic" stimulation of the movements involved with light and sound after an affection in the mechanism of central regulation. Positive results were observed in all of 40 patients undergoing treatment for walking disorders of pyramidal, extrapyramidal, cerebellar, and hysterical character. The greatest effects were attained in treating patients with cerebellar disturbances and with nonprogressive lesion of subcortical ganglia. (English summary)—*I. D. London*.

6854. Sabatino, David A. & Cramblatt, Henry. (Catholic U. of America) **A longitudinal study of children with learning disabilities subsequent to hospitalization for viral encephalitis: I.** *Journal of Learning Disabilities*, 1969(Feb), Vol. 2(2), 65-75.—Reports "on the information processing behaviors, and the relationship that these behaviors have to learning variables, during a 3-yr follow-up period for 13 children

subsequent to their hospitalization for [California encephalitis virus]." Patients 5.1-14 yr. old were given a battery of clinical tests designed to assess intelligence, performance, and perception. Decrements associated with learning disability were found in all 3 categories. It is concluded that these children would "become poor academic risks in the regular classroom," and "supportive psychoeducational work" is recommended.—*S. Appelle*.

6855. Sabatino, David A. & Cramblatt, Henry G. (Catholic U. of America) **A longitudinal study of children with learning disabilities subsequent to hospitalization for viral encephalitis: II.** *Journal of Learning Disabilities*, 1969(Mar), Vol. 2(3), 124-135.—Presents part of a 3-yr follow-up study which investigated relationships between physical findings from 13 school-age children during the acute illness associated with California encephalitis virus, and the reading comprehension academic underachievement at 6 and 36 mo. postillness. Results from the WISC, 2 perceptual tests, and parents' and teachers' responses to Ss' observable behavior show (a) a trend between length of hospital stay, seizure activity, and reading comprehension; (b) no relation between duration and height of fever and learning disability; (c) no significant differences between physical findings during illness and their prediction of reading comprehension underachievement; and (d) no obvious central language impairment, but serious perceptual problems in visual-motor and auditory areas of function making school failure a major issue. It is concluded that "classroom management for the resulting behavior is an educational problem, demanding the involvement of all disciplines" if behavior is to be altered and if an identifiable pathology is to be provided.—*M. Maney*.

6856. Schulman, Carol A. (San Diego State Coll.) **Heart rate response habituation in high-risk premature infants.** *Psychophysiology*, 1970(May), Vol. 6(6), 690-694.—Tested the hypothesis that infants with CNS damage fail to habituate to repeated stimulation using infants whose clinical course suggested a high probability of CNS damage, a control group matched for age in wk. since conception, and a group of normal, fullterm infants. An auditory stimulus at 80-db sound pressure level was presented for 3 sec. at 20-sec intervals. Heart rate change averaged across time on Trials 1-5 and 26-30 were compared. The hypothesis was not confirmed, since significant habituation was found on Trials 26-30 for all groups. However, latency of response was significantly longer in high-risk Ss. A developmental trend toward decreased latency of response with increasing gestational age was identified. (17 ref.)—*Journal abstract*.

6857. Sheval'e, A. V., Shapiro, B. M., & Shvartsur, L. S. (Medical Inst., Tselinograd, USSR) **Lopatochno-peroneal'naya amiotrofiya: Sindrom ili samostoyatel'noe zabolevanie?** [Scapuloperoneal amyotrophy: Syndrome or independent disease?] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 341-345.—Describes a case of this disease which involves a hereditary pathology of the metabolism of both nerve and muscle tissue. Biopsy of the trapezius muscle was undertaken, with microscopic studies revealing trabecular atrophy of muscle fibers and dystrophy of the nerve trunks, characteristic of secondary forms of progressive muscular atrophy. Along with atrophied

muscle fibers, normal or hypertrophied ones are noted, as in myopathy. It is reasonable to consider scapuloperoneal amyotrophy as an independent disease which includes aspects of primary and neurogenic muscular atrophy. (English summary)—*I. D. London.*

6858. Speranskii, A. P. & Antropova, M. I. (Central Inst. for Advanced Medical Training, Moscow, USSR) **Elektromiograficheskie issledovaniya bol'nykh s travmami perifericheskikh nervov pri lechenii ikh ul'trazvukom.** [Electromyographic examinations of patients with peripheral nerve traumata during ultrasonic therapy.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 382-388.—Observed 124 20-63 yr. old patients, suffering for a period of 3 mo.-21 yr. from the sequelae of different lesions of the nerve trunks of the extremities. Ultrasound (single or multiple application) promoted restoration of the functions of the limbs. The therapeutic effect was a function of both severity and duration of the injury, and the presence of a tendency to restoration. EMG examinations provide evidence for (a) the positive action of ultrasound on muscular electrogenesis, and (b) the improvement of central influences on the excitability of the neuromuscular apparatus. (English summary)—*I. D. London.*

6859. Zavallishin, I. A. (Inst. of Neurology, Moscow, USSR) **Osobennosti myshechnoi gipertonii (spastichnosti) u bol'nykh bokovym amiotroficheskimi i rasseyannym sklerozom: Kliniko-élektromiograficheskoe issledovanie.** [Features of muscular hypertonia (spasticity) in patients with lateral amyotrophic and multiple sclerosis: A clinico-electromyographic study.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 351-357.—Patients with spasticity in lateral amyotrophic (N = 36) and multiple sclerosis (N = 34) served as Ss. An attempt was made to determine the influence on muscular tonus of lesion of (a) the spinal anterior horn structures in lateral amyotrophic sclerosis, and (b) cerebellar systems in multiple sclerosis. Differences are demonstrated for the distribution, degree of manifestation, and electrographic characteristics of spasticity in these 2 diseases. (English summary) (28 ref.)—*I. D. London.*

6860. Zhirmunskaya E. A., Voitenko, G. A., & Konyukhova, G. P. (Inst. of Neurology, Moscow, USSR) **Izmenenie korrelyatsionnykh funktsii pri razlichnykh tipakh narusheniya bioélektricheskoi aktivnosti mozga.** [Alteration of correlational functions in different types of disturbance of cerebral bioelectrical activity.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 70(3), 376-382.—Presents results of a study of correlational functions, involving an analysis of 90 EEGs, in patients with different lesions of the nervous system. The remote synchronization of cortical neuronal activity resulting from morphological connections between cerebral structures was studied. Measurements were made of the magnitudes of the periodic and random components of the coefficient of cross-correlation of 2 simultaneously registered oscillatory processes, recorded either from identical points in the 2 hemispheres or from different points in 1 hemisphere. These magnitudes changed differently for different types of impairment of the EEG. It is conjectured that the calculation of correlational functions can promote a bolder discrimination of "local (or primary)" changes from those that are "remote (secondary)" in the electrogenesis of the cerebral cortex. (English summary)—*I. D. London.*

Brain Damage

6861. Barraquer Bordás, L. (U. Navarra, Barcelona, Spain) **El sueño y el mutismo aquinético.** [Sleep and akinetic mutism.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1968(Sep), Vol. 27(4), 544-555.—Reviews the physiology and general pathology of sleep, noting that the crucial condition for the appearance of akinetic mutism is a lesion of the mesencephalodiencephalic zone. This is believed to have an indirect influence on mimic expression. 2 analogous states, associated with akinetic mutism by lesion, are described. 1 involves bilateral flexion "distone" with the conservation of ocular vigilance. The other does not have "distone" and shows the loss of visual fixation. (English summary)—*P. Hertzberg.*

6862. Blinkov, S. M. & Moskatova, A. K. (Moscow State U., USSR) **K mekhanizmu prostoi dvigatel'noi reaktsii: Vremya reaktsii pri razdel'nom i odnovremennom dvizhenii obelimi rukami.** [On the mechanism of simple motor reaction: Reaction time in separate and simultaneous movement of both hands.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 86-97.—Measurements of RT following cutaneous, photic, and auditory stimulation were made on 17 normal Ss and 11 Ss with focal lesions of the brain. In normal Ss the average time of simple motor reaction to such stimulation was identical whether the response movements of the hands were made singly or together. However, differences in some normal Ss did appear. Variability in hemispheric functional asymmetry may account for this. In most normal Ss RT was the same whether the conduction of the impulse was through the right or left motor center. In Ss with focal lesion of the brain, the asymmetry of the cerebral centers with respect to RT, on simultaneous movement of both hands, was, in most cases, more pronounced than in the case of separate responses for each hand. It is concluded that the mechanism involved in the simultaneous response of both hands is different from that involved in the function of 1 hand.—*I. D. London.*

6863. Faglioni, Pietro & Spinnler, Hans. (U. Milan, Clinic of Nervous & Mental Disease, Italy) **Immediate and delayed recognition of nonsense figures in patients with unilateral hemisphere damage.** *Journal of Learning Disabilities*, 1969(Dec), Vol. 2(12), 652-658.—Investigates the performance of 119 patients with unilateral hemisphere damage in immediate and delayed recognition of meaningless visual patterns (scrawls). In both tasks the group with right hemisphere damage was found to be inferior. The impairment was considered to reflect a hemispheric asymmetry in perception, which is apparent whenever subtle visual discrimination is required. The assumption that the right hemisphere plays a role in certain types of memory processes was not confirmed. (21 ref.)—*Journal abstract.*

6864. Hartman, Bernard T. & Richards, George B. **The effect of using a black light apparatus to reduce attention scatter in brain injured children.** *Journal of Learning Disabilities*, 1969(Aug), Vol. 2(8), 391-394.—Randomly divided 20 children diagnosed as brain damaged and having severe reading and perceptual impairments evenly into an experimental group (EG) and a control group (CG). Each S in the EG was given 10 stimulus cards (learning task) under the attention-scatter reduction conditions using a black light apparatus and

then immediately given a matching test of retention. CG Ss were treated in exactly the same manner except they did not receive the stimulus under the attention-scatter reduction conditions. A t-test for difference between the 2 independent means (EG and CG) was applied, and a significant difference ($p < .001$) was shown between the test performances of the EG Ss and CG Ss. It is concluded that the EG Ss who received the learning task under attention-scatter reduction conditions retained more than the CG Ss who received the stimulus under ordinary classroom conditions.—*Journal abstract.*

6865. Kahn, J. P. (Stanford U., Medical School) **The emotional concomitants of the brain-damaged child.** *Journal of Learning Disabilities*, 1969(Dec), Vol. 2(12), 644-651.—Presents a resume of accepted premises in the field of the brain-damaged child with regard to neurological aspects, psychological concomitants, case management, differential diagnosis, and parental response. It is asserted that it is neither useful nor possible to entirely separate the neurophysiological from the psychological effects of minimal cerebral dysfunction. The child with minimal cerebral dysfunction perceives the world in a different fashion from the normal. There is a deviant construction of reality, both internal and external resulting in an organism-environment, nonfluency, and noncongruity. The child's special education and environmental requirements are discussed, and it is suggested that frequently the best psychotherapy for such a child is to meet his special educational requirements.—*Journal abstract.*

6866. Karaseva, T. A. (Moscow State U., USSR) **K voprosu o funktsiyakh korkovogo otdela slukhovogo analizatora cheloveka.** [On the functions of the cortical region of the human auditory analyzer.] *Psikhologicheskoe Issledovaniya*, 1969, No. 1, 98-102.—35 Ss with focal lesion of the upper region of the temporal lobe (21 sinistral; 14 dextral), involving the auditory cortical zone, participated in the study along with 56 controls (49 with differently located lesions; 7 normal). In the 1st group, the perception of acoustic signals of small duration (shorter than 14 msec.) directed to the ear, contralateral to the pathological focus, was affected. The disturbance of perception occurred whether the lesion was of the dominant or subdominant hemisphere and did not undergo complete compensation with time through the activity of other cerebral regions. The data provide evidence for the important role of the auditory cortex in gauging the temporal parameters of sound and in perceiving signals of small duration.—*I. D. London.*

6867. Karpov, B. A. (Moscow State U., USSR) **Sravnitel'nyi analiz narusheniya gnosticheskikh professor pri porazhenii zadnikh i perednikh otdelov golovnogo mozga u cheloveka.** [Comparative analysis of the disturbance of gnostic processes in cases of lesion of the posterior and anterior regions of the human brain.] *Psikhologicheskoe Issledovaniya*, 1969, No. 1, 108-116.—Reports results of a "dynamic neuropsychological study," in which eye movements were registered for 3 Ss viewing a picture with complex content (1 S with lesion of parietal-occipital parts of the brain; 2 with lesion of frontal parts). Depending on the locale of the lesions, there were sharp differences in "active visual perception." In the former type of lesion, the structure of the "active perceptual act" was preserved. The "orienting-investigatory stage" underwent "compensatory hypertrophy and change"; the detection of meaningful items

proceeded with purpose, i.e., selectively, in correspondence with the demands of a perceptual task or hypothesis. Eye movements reflect the selectivity and plasticity of the process of active perception. In the latter type of lesion, the structure of "prolonged active perception" is disturbed. The orienting stage in perceptual activity drops away and is replaced by the impulsive formation of a fragmentary hypothesis. The elements of the picture are not distinguished on the basis of a purposeful process, but passively by means of inert, unorganized viewing movements. Visual items that are picked out passively are not related to each other or matched against earlier formed hypotheses, thus (a) providing no stimulus for pushing the perceptual process to perfect itself, and (b) creating thereby for the perceptual process instability, rapid extinction, inertness, and interruption through irrelevant association.—*I. D. London.*

6868. Kok, E. P. & Fedorov, S. N. (Burdenko Inst. of Neurosurgery, Moscow, USSR) **Narushenie vysshikh zritel'nykh funktsii pri sdavlenii nizhnemisochnoi oblasti bol'shikh polushariy u cheloveka.** [Disturbance of higher visual functions due to compression of the inferior temporal region of the human brain.] *Zhurnal Vyssheĭ Nervnoi Deyatel'nosti*, 1969, Vol. 19(4), 602-610.—Ss were 64 14-58 yr. old patients in a tachistoscopic study of object perception in the presence of compression of the inferior temporal region of the brain or other cerebral regions, the latter for purposes of control, using the decline of speed of object perception as the most sensitive index of visual gnostic defectiveness. Disorders of visual object perception in 12 Ss with extracerebral tumors of the inferior temporal region were manifested in a drop in speed of perception of object representations. Indices for the principal group were significantly lower than those for the control groups: (a) 14 Ss with extracerebral tumors of the occipital, parietal, frontal, and superior temporal regions; and (b) 38 Ss with different kinds of lesions of the brain, cerebral membranes, extracerebral vessels, and vessels within the medial and deep portions of the brain. Indices showed the grossest decline in lesion of the right (subdominant) hemisphere—further evidence that visual gnostic function is a higher cortical function, since in man the higher functions alone are unequally provided for by the 2 hemispheres. The resulting hemispheric differences may be explained by the greater differentiated character of the functional systems of the left hemisphere and the greater selectivity of their activity.—*I. D. London.*

6869. Lebedinskii, V. V. (Moscow State U., USSR) **K voprosu o narushenii kontrolya za protekayushchimi deistviyami u bol'nykh s porazheniem lobnykh dolei mozga.** [On the disturbance of regulation of a course of actions in cases of lesion of the frontal lobes of the brain.] *Psikhologicheskoe Issledovaniya*, 1969, No. 1, 103-107.—12 Ss with frontal lesions of light severity and 16 with serious resultant functional disorders participated in a study of the state of visual and kinesthetic regulation of ongoing action in such cases. It is concluded that the perseverations observed in frontal lesions are, in fact, complex motor disorders. The data lend support to those explanations of certain behavioral disorders, resulting from frontal lesions, that do not go beyond conceptions which view the frontal lobes as effector systems to promote the "organization of motor programs."—*I. D. London.*

6870. Williams, Moyra. (Addenbrooke's Hosp., Cambridge, England) **Brain damage and the mind.** Baltimore, Md.: Penguin Books, 1970. 175 p. \$1.95(paper).

6871. Woo-Sam, James, et al. (Rancho Los Amigos Hosp., Downey, Calif.) **Socio-economic status and post-trauma intelligence in children with severe head injuries.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 147-153.—Study of 46 severely head-injured children suggests that the degree of intellectual recovery posttrauma is best predicted by the age at injury. Younger Ss generally fared less well than older. However, socioeconomic affiliation also was a determining factor. The majority of younger Ss were from the lower socioeconomic class and proportionately more younger than older Ss of lower-class affiliation functioned at the subnormal level. In contrast, for the middle-class group proportionally as many younger as older Ss functioned at the subnormal level. (21 ref.)—*Journal abstract.*

Epilepsy

6872. Badalyan, L. O., et al. (2nd Moscow Medical Inst., USSR) **Kliniko-geneticheskoe i elektroentsefalograficheskoe izuchenie epilepsii u bliznetsov.** [Clinico-genetic and electroencephalographic study of epilepsy in twins.] *Zhurnal Nevropatologii i Psikiatrii*, 1970, Vol. 69(3), 329-336.—Studied 15 monozygotic and 20 dizygotic twins (1½-16 yr. old) in which in each pair either 1 or both had epilepsy, 7 monozygotic and 9 dizygotic twins underwent EEG examination. The EEGs were subjected to visual quantitative evaluation and automatic integrative analysis. A definitely higher correlation was observed between the clinical development of epilepsy and changes in biopotentials among the monozygotic twins. Correspondingly, the changes noted between the pairs of dizygotic twins with respect to clinical and EEG data are much more at variance, especially when different sexes are involved. Among phenotypically normal twin-partners, paroxysmal disturbances of the EEG of the epileptic type may be observed. Such changes may be viewed as an EEG effect resulting from "heightened convulsive readiness" of the brain. Since these twins are under 16 yr. old, the possibility of a "manifestation" of epilepsy in the future cannot be excluded. (English summary)—*I. D. London.*

6873. Fuster, Pilar & Barcia, Demetrio. (U. Valencia, Faculty of Medicine, Spain) **Ninfomania y epilepsia en la infancia: Presentación de cuatro casos.** [Nymphomania and epilepsy in infancy: Presentation of four cases.] *Revista Española de Oto-Neuro-Oftalmología y Neurocirugía*, 1968(Jul), Vol. 27(158), 259-271.—Presented case histories of 4 girls (ages 8-12) who were suffering from temporal lobe epilepsy with concomitant nymphomania. All 4 Ss had a common behavior pattern which oscillated between exaggerated needs for affection and manifest anxiety. Each of the 4 Ss demonstrated signs of infantilism, while 3 of the Ss had pronounced fixations at the oral stage of psychosexual development. Following careful interviewing, EEG recordings, IQ testing, personality testing (Rorschach), and neurological examinations, it is concluded that the nymphomaniac behavior was the result of a poor family environment which elicited abnormal personality development and immaturity. (English summary)—*B. A. Stanton.*

6874. Gandiglio, G., Ferro, F. M., & Gambi, D. **Un'esperienza epilettica: Analisi dal diario.** [An epileptic experience: Analysis of a diary.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1969(Mar), Vol. 30(2), 167-184.—The diary of an epileptic girl revealed individual

depths that transcend rigid nosological considerations and that emphasize the transactional aspects of any organic disease with the interpersonal context, especially the therapeutic.—*L. L'Abate.*

6875. Gorbacheva, N. I. (Moscow State U., USSR) **K voprosu o narushenii dinamiki poznavatel'nykh protsessov.** [On disturbance of the dynamics of the cognitive processes.] *Psikhologicheskie Issledovaniya*, 1969, No. 1, 167-171.—30 epileptics (duration of pathology, 1-8 yr.) were used to study the psychological characteristics of the dynamic disturbances of the cognitive processes during the early stages of the pathology. The results of various tests show that the disturbances were not uniform. In 1 group, "exhaustion of psychic processes and oscillation of mental efficiency" was exhibited—symptoms basically typical for cases where there are marked organic disturbances of the CNS. In the 2nd group, features of the psyche were exhibited that were typical of epilepsy, such as inertness and decline of the level of generalization. Several of the disturbances of cognitive activity, which have previously been considered to be a "manifestation of intellectual operations, represent, judging by their structure, a dynamic change of cortical activity."—*I. D. London.*

6876. Moretti, G., Bertamino, F., & De Negri, M. **Contributo preliminare allo studio della coscienza di malattia nel bambino epilettico.** [Preliminary contribution to the study of awareness of sickness in the epileptic child.] *Neuropsichiatria*, 1968(Jan), Vol. 24(1), 65-80.—20 7-14 yr. old epileptic children reported on their awareness of their sickness in various ways, according to cognitive patterns typical of each stage of development.—*L. L'Abate.*

6877. Sal y Rosas, Federico. **Abrogación de la epilepsia esencial.** [Abrogation of essential epilepsy.] *Revista de Neuro-Psiquiatria*, 1969(Jun), Vol. 32(2), 105-108.—Presents arguments on the genesis of epilepsy which support the contention that essential epilepsy would be more accurately described as centroencephalic epilepsy. The existence of centroencephalic alterations as the cause of essential epilepsy is considered important because it rules out a "sine materia" etiology. The implications are (a) that all clinical forms of epilepsy have an origin somewhere in the brain, and (b) that a predisposition toward epilepsy is as universal as a lesion. It is suggested that the lesion which causes centroencephalic epilepsy is of the structural type. (English, French, & German summaries)—*P. Hertzberg.*

6878. Serafetinides, E. A. (U. Oklahoma, Medical Center) **Memory for words and memory for numbers.** *Journal of Learning Disabilities*, 1969(Mar), Vol. 2(3), 142-143.—Reports pre- and postoperative observations on the relationship of verbal to numerical learning and memory in 2 males, a 23 and a 25 yr. old, on whom anterior temporal lobectomies for epilepsy were performed on the dominant side for speech. Postoperative WAIS results show that both Ss had nominal expressive aphasia and auditory verbal learning deficit, but no deficit on arithmetic tasks or memory for numbers. Results suggest that the dominant temporal lobe may not be involved primarily in arithmetic processes.—*M. Maney.*

6879. Sörgel, H. J. & Schmeisser, G. (Medical Academy, Erfurt, E. Germany) **Untersuchungen zur Spätepilepsie bei hirnatrophisierenden Prozessen.** [Investigations on delayed epilepsy with encephalatrophy processes.] *Psychiatrie, Neurologie und medizinische Psychologie*, 1970(Jun), Vol. 22(6), 227-230.—Cryptogenic

epilepsy was diagnosed in 77 of a sample of 1724 patients admitted to the Erfurt Nerve Clinic between 1954-1967. The majority of patients were males, 50 yr. of age or older. An encephalotropic process established by means of pneumoencephalography is described. (25 ref.)—*K. J. Hartman.*

MENTAL RETARDATION

6880. Altman, R., Swartz, J. D., & Cleland, C. C. (U. Texas) **Differential sensitivity of profound retardates to adults' steady gaze.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 30.—Showed that all of 10 ambulatory male profoundly mentally retarded Ss were sensitive to steady gaze. 2 distinct types of behavior were elicited within 30 sec. "Avoiders" (N = 6) typically turned and walked away; "approachers" (N = 4) typically laughed, increased babbling, embraced E, and appeared pleased. Such intra-S consistency supports the notion of a "high degree of regularity and organization among... nonverbal behaviors..."—*M. West.*

6881. Burchard, John D. (U. North Carolina) **A methodology for conducting an experimental analysis of cheating behavior.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 146-158.—Presents data from 2 mildly retarded, adolescent boys to demonstrate how variables, e.g., surveillance, task difficulty and punishment influence the frequency of their cheating behavior. Ss responded to a light signal flashed at 15 sec. intervals and were rewarded for correct responses by candy and a redeemable token. After training was completed, Ss guessed when the now hidden light was on. Cheating responses were recorded when Ss attempted to uncover light to see if it was on. Although the data suggest some strong effects from the variables, there was insufficient replication to warrant meaningful generalization. (15 ref.)—*Journal abstract.*

6882. De Siqueira, Maria. (Dr. Edmundo Carvalho Experimental Psychology Group, São Paulo, Brazil) **Subdesenvolvimento e deficiência mental: Aspectos psicológicos.** [Underdevelopment and mental deficiency: Psychological aspects.] *Revista Brasileira de Deficiência Mental*, 1969(Jul), Vol. 4(1-2), 23-28.—Asserts that mental deficiency is basically a cultural problem, noting that 15% of cases of mental deficiency have biomedical causes while 85% are cultural or socioeconomic backwardness. The mechanism of stimulus deprivation is explained, with attention given to "critical learning periods." The psychological characteristics of the culturally-deprived child, and the impact which school has on him are discussed. His language disability limits his reasoning in abstractions; his difficulty with sensory discrimination leads to lack of perceptual discrimination; and his memory is underdeveloped. On failing in a school oriented towards middle-class children's needs, in which he is rejected by both teachers and classmates, he loses confidence in his ability to learn, loses motivation, and can become aggressive because he cannot control his impulses. A study on reversibility-irreversibility of processes leading to lowered intellectual development capacity is recommended. Early detection via preschool education, maternal schools, community, and family work is suggested.—*K. Rissland.*

6883. Macht, Joel. (U. Denver) **Examination and reevaluation of prosthetic lenses employing an operant procedure for measuring subjective visual acuity in a retarded child.** *Journal of Experimental Child Psychology*, 1970(Oct), Vol. 10(2), 139-145.—Ex-

amined and evaluated prosthetic lenses that were prescribed without a professional subjective visual-acuity examination. The procedure employed a bar-press response to Snellen "E" visual symbols viewed from varying distances. S was a 6-yr-old retarded female with severe bilateral strabismus and nystagmus. Evaluation of the prescribed lenses indicate their magnitude was too strong for the S to accommodate, thus accounting for nonglass-wearing behavior of the S. Reevaluation resulted in a decrease of more than +3 diopters of refraction of lens size. Suggestions are offered regarding prerequisite inclusions for procedures for obtaining psychophysical threshold information from children.—*Journal abstract.*

6884. Manfredini, Jurandyr. **Subdesenvolvimento e deficiência mental: Aspectos psiquiátricos: Análise de dados de incidência no Brasil.** [Underdevelopment and mental deficiency: Psychiatric aspects: Analysis of data on the incidence in Brazil.] *Revista Brasileira de Deficiência Mental*, 1969(Jul), Vol. 4(1-2), 37-44.—Presents statistics which basically show that the better a country or region is developed, the lower the incidence of mental deficiency. The characteristics of mental deficiencies were grouped into 7 categories: (a) psychological retardation, (b) psychological overdevelopment, (c) morphological defects, (d) neuropathological anomalies, (e) sensory deficiencies, (f) congenital visceropathology, and (g) behavioral disturbances. The incidence of mental deficiency in Brazil between 1963 and 1967 showed an increase. However, the incidence of oligophrenia was also studied according to regions. It was found that the greater the development of the region, the lesser the amount of mental deficiency. Variations in the different grades of Brazilian mental deficiency and in the etioclinal aspects are also presented.—*P. Hertzberg.*

6885. Mehl, Herley. (Federal U., Parana, Brazil) **Subdesenvolvimento e deficiência mental: Aspectos psicológicos.** [Underdevelopment and mental deficiency: Psychological aspects.] *Revista Brasileira de Deficiência Mental*, 1969(Jul), Vol. 4(1-2), 29-36.—Discusses the relationships between economic underdevelopment and mental deficiency on 2 levels: individual and group. In regard to groups, Brazilian cultural and socioeconomic situations which contribute to mental deficiency are regarded from a social psychological viewpoint. Suggestions include the improvement of educational facilities and the establishment of family guidance procedures to help in the detection and treatment of mental deficiency. Studies are cited, including those of Margaret Mead and Barbara Ward, which further the conclusion that mental deficiency is conditioned by social factors. Further suggestions include (a) the establishment of national and regional diagnostic centers, (b) the improvement of existing clinical programs and the creation of new ones, and (c) different types of reactions to mental deficiency based on different social class levels in Brazil. (19 ref.)—*P. Hertzberg.*

6886. Meyer, Roger J., Stafford, Richard L., & Jacobsen, Milton D. (Northwestern U., Medical School) **Patterns of family followup: A study of children with mental retardation and associated developmental disorders.** *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 393-400.—Describes a follow-up study of services to 100 children with mental retardation and associated disorders. Results reveal many unmet needs, although the great majority of families received satisfactory service. The importance of considering the

families' presenting problems as the focal point of management was demonstrated. Family characteristics of social class, referral source, and presenting problems were correlated with the expressed needs. The specific nature of S's mental retardation problem was less closely related to these needs. The importance of a continuing diagnostic-therapeutic evaluation as a model for management of mental retardation is emphasized.—*Journal abstract.*

6887. Peterson, Martin Q. (U. Wisconsin) **Morphological sub-groups in Down's syndrome.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 779.

6888. Pinto, Luiz F. **Aspectos psiquiátricos da deficiência mental em países subdesenvolvidos.** [Psychiatric aspects of mental deficiency in underdeveloped countries.] *Revista Brasileira de Deficiência Mental*, 1969(Jul), Vol. 4(1-2), 45-54.—Presents a panoramic view of the social, economic, and cultural problems which contribute to the high rate of mental deficiency in Latin America and particularly Brazil, which is seen as a poor agrarian country in need of modernization and socioeconomic reform. The influence of malnutrition and health problems on the incidence of mental deficiency is discussed. The problems of high illiteracy rates and the emigration of professional talent of Brazil is considered. Suggestions for reform include the expansion of schools and improvement of the quality of education. (21 ref.)—P. Hertzberg.

6889. Rice, James A. (U. Houston) **Confusion in laterality: A validity study with bright and dull children.** *Journal of Learning Disabilities*, 1969(Jul), Vol. 2(7), 368-373.—Analyzed laterality confusion with 200 kindergarten-3rd grade bright Ss and 41 age-to-grade matched educable mental retardates. Results based on a 24-item right-left discrimination test, 2 subtests of the Illinois Test of Psycholinguistic Abilities, and the Reading and Arithmetic subtests of the Wide Range Achievement Test suggest that: (a) confusion is related principally to CA, and broadly, to intelligence; (b) rate of decline in laterality confusion is not different for the 2 groups; and (c) measures of language and achievement are only moderately related to laterality confusion, and reading in particular, is not.—*Journal abstract.*

6890. Riedel, Wolfgang W. & Milgram, Norman A. (Catholic U. of America) **Level of aspiration, locus of control and n-Achievement in retardates and normal children.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 551-557.—Compared 49 educable retardates with 20 3rd and 19 6th grade normal children on measures of locus of control, level of aspiration, and need-Achievement. Results are consistent with a developmental progression, 6th graders scoring more internal in locus of control and more realistic in level of aspiration than 3rd graders. The retardates who were chronologically older than the 6th graders tended to resemble 3rd graders on these various measures. (19 ref.)—*Journal abstract.*

6891. Sole Sagarra, Jose. **El substrato organico de las oligofrenias.** [The organic substratum of oligophrenia.] *Revista de Neuro-Psiquiatria*, 1968(Sep), Vol. 31(3), 175-193.—Distinguishes between inherited and acquired oligophrenia, noting the importance of neuropathological, biochemical, and EEG research to determine the causes and treatments of the disease. The anatomical and physiopathological bases of mental deficiency are discussed, including disorders in prenatal nervous system development, prenatal circulatory disorders, infection, metabolic disorders, neoplastic mal-

formation, and chromosomal abnormalities. The diverse nature of anatomical lesions caused by oligophrenia is examined. 3 major lesion groups are elaborated: (a) those of congenital origin, (b) delayed brain development through an acquired affliction, and (c) active pathology in the brain. The physiopathology of oligophrenia is discussed with emphasis on amaurotic idiocy, phenylketonuria, cretinism, diffuse sclerosis, and Downs syndrome. (English, French, & German summaries)—P. Hertzberg.

6892. Terrell, Catherine G. (George Peabody Coll. for Teachers) **Effects of chemical stimulation on activity level and cognitive behavior of high-active and low-active retardates.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 427-428.

6894. Vlasova, T. A. & Petrova, V. G. (Inst. of Defectology, Moscow, USSR) **Pervyi mezhdunarodnyi kongress po izucheniyu umstvennoi otstalosti.** [1st International Congress on the Study of Mental Retardation.] *Spetsial'naya Shkola*, 1969, No. 1, 128-135.—Presents an account of the 1967 Congress, held in Montpellier, France. Summaries of papers are given and commented upon.—I. D. London.

6895. Wallace, R. M. & Fehr, F. S. (U. Illinois, Children's Research Center) **Heart rate, skin resistance, and reaction time of mongoloid and normal children under baseline and distraction conditions.** *Psychophysiology*, 1970(May), Vol. 6(6), 722-731.—Evaluated RT, body movement, heart rate, and skin resistance of mongoloid and normal control children under base-line and distraction conditions. Mongoloids demonstrated: (a) slower RT under both conditions, (b) a reduced skin resistance response and fewer heart rate fluctuations during the base-line period, and (c) fewer skin resistance fluctuations during the distraction condition. Skin resistance fluctuations were negatively correlated with RT, and heart rate fluctuations, although not significant, were in the same direction. Findings support the theoretical assertions of J. I. Lacey and B. C. Lacey that spontaneous activity is related to motor impulsivity, cortical activity, and general skeletal-motor functions. Body movement was negatively related to these measures of spontaneous activity and cannot be invoked as an explanation for the findings. (15 ref.)—*Journal abstract.*

Learning & Motor Ability

6896. Bitsky, Linda. (George Peabody Coll. for Teachers) **The role of cue novelty and cue discriminability in the discrimination shift performance of retardates and normal children of comparable ability.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 406.

6897. Blue, C. Milton. (U. Georgia) **Anticipation vs recall in the paired-associate learning of intellectually average and retarded subjects.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 327-334.—Conducted a paired-associates (visual materials) study with 24 intellectually average and 24 educable mentally retarded individuals of high school age. Each S received 2 equivalent tasks, 1 in the anticipation method of presentation and the other in the recall method. The

learning speed of the average Ss was significantly superior to that of the retardates. Method of presentation did not influence the learning of the average Ss but learning in the recall presentation was superior for retarded Ss.—*Journal abstract.*

6898. **Graham, N. C.** (U. Birmingham, School of Education, England) **Memory span and language proficiency.** *Journal of Learning Disabilities*, 1968(Nov), Vol. 1(11), 644-648.—Reports thinking and experimentation concerned with the relationships between memory span which is usually very short in educationally subnormal children and the ability to process sentences of standard English in a limited number of tasks. The input, integration, and output of learned material is discussed, and the dependence of ability to repeat and comprehend sentences on memory span as well as a procedure for testing repetition of sentences ability is demonstrated.—*M. Maney.*

Training & Vocational Rehabilitation

6902. **Brolin, Donn E.** (U. Wisconsin) **The implementation of recommendations from an evaluation center for the mentally retarded and an analysis of variables related to client outcome.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 896.

6903. **Linford, Anthony G. & Duthie, James H.** (U. Illinois, Children's Research Center) **Spontaneous unintentional conditioning of the experimenter as a reinforcer.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 518.—During a study in which a chaining technique was used to teach young trainable Down's syndrome children a high endurance physical activity, an S failed to exhibit response decrement on withdrawal of primary and social reinforcement. By use of remote control TV cameras it was possible to establish that the behavior was maintained by the presence of the E alone. The need for reversal procedures to determine controlling stimuli in operant studies is indicated.—*Author abstract.*

6904. **Shulman, Lee S.** (Michigan State U.) **Negro-white differences in employability, self-concept, and**

related measures among adolescents classified as mentally handicapped. *Journal of Negro Education*, 1968(Sum), Vol. 37(3), 227-240.—Investigated the determinants and course of vocational development in white and Negro adolescents classified as mentally handicapped. 36 Negro and white children diagnosed as essentially the same in mental retardation by school psychologists were found to be significantly different on measures reflecting "ability to comprehend instructions, work rhythm and coordination, absence of odd or inappropriate behavior, absence of complaints about self-inadequacies and appropriateness of expressed worker role." In all cases the Negro Ss were superior. Analysis of the Ss' home environments suggest that these results reflect contrasts between "lower-class disadvantaged youngsters and middle-class retardates" rather than Negroes and whites per se. It is argued that "better means of identifying the etiologies of educational handicaps" are needed.—*S. Appelle.*

PHYSICAL ILLNESS

6905. **Futterman, Edward H. & Hoffman, Irwin.** (U. Illinois, Medical School, Chicago) **Transient school phobia in a leukemic child.** *Journal of the American Academy of Child Psychiatry*, 1970(Jul), Vol. 9(3), 477-494.—Presented a case of transient school phobia in a fatally ill little girl in which death played a major role in the genesis of the phobia. With reduction of the immediacy of the danger and appropriate parental response, spontaneous remission occurred. The impact of the prolonged threat of death is critical in distinguishing families with a leukemic child from other families coping with day-to-day separations. When the threat interacts with family vulnerabilities during a particular developmental period, potential for regression at a later time is enhanced. Further threat can lead to symptoms. In this child, school phobic symptoms appeared which are less refractory and more responsive to ego control of mother and child than previously described in the literature. In the family usual criteria for psychopathology were difficult to apply. Data indicate that, in the face of severe threat, families often demonstrate great resources along with great distress. The route to adaptation is often circuitous, with transitory symptom formation related to coping processes. (30 ref.)—*Journal summary.*

6906. **Honzik, Marjorie P., Collart, Donna S., Robinson, Saul J., & Finley, Knox H.** (U. California, Inst. of Human Development, Berkeley) **Sex differences in verbal and performance IQ's of children undergoing open-heart surgery.** *Science*, 1969(Apr), Vol. 164(3878), 445-447.—In an experiment with 60 boys and 58 girls with congenital heart defects, it was found that boys had essentially normal verbal and performance IQs on pre- and postoperative tests. Girls' verbal IQs, however, were significantly lower than those of boys, and lower than girls' own performance IQs. This sex difference among congenital heart cases reverses the usual finding that girls excel on verbal tests.—*Journal abstract.*

6907. **Nan'no, Hisashige, et al.** (Osaka U., Medical School, Japan) **A neurophysiological study of sleep paralysis in narcoleptic patients.** *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 382-390.—Studied behavioral response by pressing a switch placed in the hand and EEG arousal response to external stimuli (calling S by name 3-5 times at short intervals) in the REM period in nocturnal sleep. Ss were

8 normal 21-29 yr. old controls and 8 15-50 yr. old narcoleptics with sleep paralysis and other narcoleptic symptoms. All vocal stimuli, with a few exceptions, were perceived by Ss. Narcoleptics and controls, when stimulated in the REM period occurring more than 1 hr. after sleep onset (the nonsleep-onset REM period), responded to most of the stimuli by pressing the switch. In the REM period occurring at the sleep onset (the sleep-onset REM period), in which narcoleptics experienced sleep paralysis, they frequently failed to show a behavioral response (statistically significant). EEG arousal response was more marked in controls than in narcoleptics. In narcoleptics it was more prominent in the nonsleep-onset REM period. Findings suggest that a dissociation between perception or consciousness level and somatic motor function occurring in narcoleptics in the sleep-onset REM period produces sleep paralysis. Possible neurophysiological mechanisms related to the occurrence of this dissociation in the sleep-onset REM period and of this sleep state in narcoleptics are discussed. (French summary) (46 ref.)—*Journal summary*.

6908. Piana, Mary T. (Creedmore State Hosp., Queens Village, N.Y.) **An economical enzymatic debriding agent for chronic skin ulcers.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(1), 98-100.—Papain-urea ointment is as effective as any topical preparation previously used in the treatment of chronic skin ulcers. A preliminary double-blind test was performed on a 72-yr-old woman with 2 decubitus ulcers. In a subsequent trial, "27 patients with a total of 59 ulcers were treated with the papain-urea debriding ointment." In all the cases excellent debriding action was noted. "Generally the lesions became clean and free of necrotic tissue in 3-4 days." Since it is much cheaper than other enzyme products, it can be recommended particularly for large institutions with long-term, elderly patients, and small nursing forces.—*D. Prager*.

6909. Rodos, Jerry. (1660 Broad St., Cranston, R.I.) **The treatment of obesity with voranil (SU-10568), a new non-amphetamine anorexigenic agent.** *Journal of the American Osteopathic Association*, 1969(Oct), Vol. 69, 161-164.—Attempted to determine the effectiveness of voranil in producing weight loss through appetite suppression. Ss were 11 men and 39 women whose weight was at least 20% above ideal. They were placed on a regimen of voranil 50 mg/day and a 1000 calorie diet and studied for 6 mo. The final weight reduction figures were calculated for all but 5 Ss. 6 lost 20 lb. or more, 15 lost more than 10, 10 lost less than 10, and 9 patients lost less than 5. 4 gained weight. Side effects, chiefly headaches, caused 4 Ss to drop out of the study. 3 Ss experienced transient elevations in the serum glutamic oxaloacetic transaminase level. There was considerable variation in Ss' reports of hunger, but most felt "full" or "satisfied."—*Journal abstract*.

6910. Schucman, Helen & Thetford, William N. (Columbia U., Coll. of Physicians & Surgeons) **A comparison of personality traits in ulcerative colitis and migraine patients.** *Journal of Abnormal Psychology*, 1970(Dec), Vol. 76(3, Pt. 1), 443-452.—Tested 3 hypotheses based on the Personality Assessment System (PAS), a new theoretical approach to relating personality traits to patterns of intelligence test performance. The ultimate aim of the PAS is to provide insights into personality structure and function based on objective test data. The sample included 35 Ss with ulcerative

colitis, 29 with migraine headaches, and 207 controls. It was hypothesized that: (a) migraine group would be predominately externalizers, while colitis Ss would be internalizers; (b) both groups would evidence "an uncompensated but modified contact state"; and (c) the migraine Ss would consist mainly of regulated Ss and the colitis group of flexible. Results support the hypotheses. (17 ref.)—*Journal abstract*.

6911. Vaughan, Herbert G. & Ritter, Walter. (Albert Einstein Coll. of Medicine, Yeshiva U.) **The sources of auditory evoked responses recorded from the human scalp.** *Electroencephalography & Clinical Neurophysiology*, 1970(Apr), Vol. 28(4), 360-367.—Studied the scalp distribution of auditory evoked responses (AERs) in 6 normal adult male Ss and in 4 patients who had undergone carotid angiography. The late (200 msec.) component to regular stimulation showed a polarity inversion across a line overlying the Sylvian fissure, being positive above and negative below it. The observed distribution, when compared with that predicted from a multishell volume conductor model, was most consistent with dipole layer sources within the primary auditory projection cortex in the supratemporal plane. AERs to monaural stimuli were larger over the contralateral hemisphere, also supporting their specific origin. In contrast, the longer latency (300 msec.) component appearing in AERs elicited by infrequent aperiodic stimuli possessed a different distribution consistent with its origin in parieto-temporal association cortex. It was possible to differentiate the myogenic postauricular response, which possessed a quite circumscribed distribution, from the early AER components of intracranial origin whose distribution was similar to that of the 200-msec component. (French summary) (25 ref.)—*Journal summary*.

6912. Zivin, Israel. (Northwestern U., Medical School) **The neurological and psychiatric aspects of hypoglycemia.** *Diseases of the Nervous System*, 1970(Sep), Vol. 31(9), 604-607.—Discusses hypoglycemia, stressing both the neurological and emotional aspects of the illness. 2 illustrative case studies are presented of patients with hypoglycemia who were initially felt to be emotionally disturbed. The organic nature of their illness was revealed after hospitalization. It is noted that altered physical and emotional behavior with periods of unawareness can indicate the presence of hypoglycemia. Common symptoms include light headedness, anxiety, tremulousness, irritability, hunger, and nausea. Causes of the illness are presented including exogenous insulin overdosage in diabetics, adreno-cortical insufficiency, pituitary tumors, lesions of the hypothalamus and brainstem, alcoholism, hypothyroidism, intestinal surgery, and prolonged diarrhea. Results of severe or prolonged hypoglycemia are discussed.—*P. McMillan*.

6913. Roberts, Leigh M., Halleck, Seymour L., & Loeb, Martin B. (Eds.) (U. Wisconsin) **Community psychiatry.** Garden City, N.Y.: Anchor, 1969. x, 269 p. \$1.45(paper).—Presents proceedings of the 1964 Symposium on Community Psychiatry at the University of Wisconsin. Papers are presented by various authors representing the fields of psychiatry, psychology, social work, sociology, education, and law.

COMMUNITY SERVICES

6914. Beigel, Allan. (U. Arizona, Medical School)

Planning for the development of a community mental health center: II. Planning of services. *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 356-365.—Describes the planning of comprehensive services within a community mental health center. Basic principles and guidelines are detailed for each of the 5 essential services: inpatients, outpatients, partial hospitalization, emergency, and consultation and education. Special attention is called to additional services of training and research and evaluation which are crucial to the growth of the program. The planning of any service will only be as effective as the amount of consideration which has also been given to understanding the catchment area, administration, continuity of care, and the areas of staffing and funding. (52 ref.)—*Journal abstract.*

6915. Braun, Samuel J. & Reiser, Nancy R. (Somerville-Cambridge Mental Health & Mental Retardation Program, Cambridge, Mass.) **Teacher-parent work in the home: An aspect of child guidance clinic services.** *Journal of the American Academy of Child Psychiatry*, 1970(Jul), Vol. 9(3), 495-514.—Describes preschool counseling in the home. The following skills and qualities of preschool teachers relevant for parent work are discussed: (a) ability to observe young children, (b) a framework of child development which emphasizes learning, (c) ability to translate abstract concepts into concrete operations, (d) a professional title which embodies the expectations of growth and future, and (e) the capacity to empathize with the parental role. The parental role in the helping process is examined. (16 ref.)—G. Steele.

6916. Cohen, Raquel E. & Schulberg, Herbert C. (Harvard Medical School, Boston, Mass.) **A review and preview of a training program in community mental health.** *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 383-386.—Describes the evolution of the community mental health training program at Harvard Medical School and the ways in which it has attempted to remain relevant and flexible. Issues affecting future directions are described.—*Journal abstract.*

6917. Cook, Patrick E. (Ed.) (Florida State U.) **Community psychology and community mental health: Introductory readings.** San Francisco, Calif.: Holden-Day, 1970. xiii, 286 p.

6918. Daniels, Robert S. (U. Chicago, School of Biological Sciences) **Disorganization in statewide planning for improved mental health services: Problems and possible solution.** *Comprehensive Psychiatry*, 1970(Mar), Vol. 11(2), 100-107.—Asserts that planning for human services is disorganized and inefficient. Deficiencies in the current system include its complexity, its lack of clear goals, its lack of interrelationships among its parts, and its rapidly pyramiding structure. Suggestions are made to clarify structure and function and to interrelate the parts. Meeting the needs of consumer more than on professional and organizational needs is emphasized.—D. Prager.

6919. Glaser, Frederick B. (Temple U., Health Sciences Center) **Our place: Design for a day program.** *American Journal of Orthopsychiatry*, 1969(Oct), Vol. 39(5), 827-841.—Faced with the challenge of community mental health, a day program, which operates as a therapeutic community under a nonmedical model of treatment and utilizes multiple interlocking group therapy exclusively, is discussed. Particular emphasis is placed on the importance of nonprofessional and outpatient staff members. (60 ref.)—*Journal abstract.*

6920. Gorman, Mike. (National Committee Against Mental Illness, Washington, D.C.) **Community mental health: The search for identity.** *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 347-355.—Evaluates the performance and potential of the community mental health center movement from the perspective of 6 yr. of operation on a national scale. The program has (a) brought psychiatric care to hundreds of thousands of citizens who were never reached before, and (b) affirmed the dignity of the individual suffering from an emotional disturbance. The major difficulty at this time is the uncertain financial support from the federal government and at the local level, which makes it difficult for many centers to acquire and hold the staff necessary to meet the demands upon their services. As a consequence, it is the belief of many associated with this program since its inception that the community mental health center will achieve neither stability nor its true potential until a universal system of prepaid medical care in this country is devised.—*Journal abstract.*

6921. Gottschalk, Louis A., Morrison, Gilbert C., Drury, Robert B., & Barnes, Allen C. (U. California, Medical Coll., Irvine) **The Laguna Beach experiment as a community approach to family counselling for drug abuse problems in youth.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 226-234.—Describes the Laguna Beach Drug Abuse Center for Youth in California which served as a problem clarification and communication facilitating occasion between children and parents. It did not function for the purpose of individual problem solving. An attempt is made to encourage young people and their parents to express their views about the usual problems of adolescence and parenthood. Informal information about drugs, their pharmacology, their uses, and adverse side effects is provided. There is need in this program for close cooperation between the school, the community, and the family.—D. Prager.

6922. Hailey, Anthea; Wing, Lorna, & Wing, J. K. (Inst. of Psychiatry, London, England) **Camberwell Psychiatric Case Register: II. Basic data required for planning.** *Social Psychiatry*, 1970(Oct), Vol. 5(4), 195-202.—Presents findings for the 1st 3 yr. of a study of the mental health services in southeast London. The characteristics of 416 long-hospitalized patients are discussed. Data indicate that: (a) the number of patients is decreasing, but at a slower rate than officially forecast; (b) admissions for organic psychosis show the highest retention rate over time, and those for reactive depression the lowest; (c) replanning of short- and medium-term inpatient beds has been initiated; (d) changes in the local inpatient agencies are being examined; and (e) the number of outpatient services is higher for Camberwell than nationally, due largely to the teaching hospitals in the area. The direction of future developments in the area, and the importance of a case register in monitoring them, are discussed. (French & German abstracts)—*Journal abstract.*

6923. Lamb, Charles W. (Mary Imogene Bassett Hosp., Cooperstown, N.Y.) **Telephone therapy: Some common errors and fallacies.** *Voices: The Art & Science of Psychotherapy*, 1969-1970(Win), Vol. 5(4), 42-46.—Presents some of the common problems encountered in learning and teaching "telephone therapy" with callers to a suicide prevention and crisis service. Various pitfalls are pointed out, and positive suggestions are given for avoiding these. Also, what the person

engaged in "telephone therapy" has to offer the caller is described.—*S. R. Greenwald.*

6924. **Langston, Robert D.** (Baylor Coll. of Medicine, Houston, Tex.) **Community mental health centers and community mental health ideology.** *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 387-392.—Studied the adherence of 2 community mental health center staffs to community mental health ideology, as measured by the Baker-Schulberg Community Mental Health Ideology (CMHI) Scale. The results for equivalent populations were the same as those of the only previously reported study, indicating the CMHI Scale is a reliable research tool. Significant relationships were found between scores and (a) professional affiliation, (b) years of liberal arts education, and (c) length of time working in a mental health center. Medical education appears to have a different effect on adherence to the ideology of the community mental health movement than that of liberal arts education.—*Journal abstract.*

6925. **Newman, Leonard.** (Contra Costa County Mental Health Services, Martinez, Calif.) **Instant placement: A new model for providing rehabilitation services within a community mental health program.** *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 401-410.—Discusses methods of restoring the social-vocational functions of mental patients. Traditional methods, developed for use with the physically disabled and outside the mainstream of the mental hygiene movement, may bias the selection process and reinforce patients' unemployed status. A new model is proposed consisting of: (a) job placement at the start of the rehabilitation process, (b) extinction of inadequate social-vocational behavior and shaping of appropriate work habits and interpersonal skills, and (c) use of nonprofessional leaders directing work-related activity groups. More realistic criteria of success and new professional roles by staff are proposed.—*Journal abstract.*

6926. **Purvis, S. A. & Miskimins, R. W.** (Ft. Logan Mental Health Center, Denver, Colo.) **Effects of community follow-up on post-hospital adjustment of psychiatric patients.** *Community Mental Health Journal*, 1970(Oct), Vol. 6(5), 374-382.—Discusses the effects of community follow-up programs in increasing the adjustment of former psychiatric patients. It is suggested that even intermittent hospitalization perpetuates dependency and hinders full rehabilitation in the community. Research findings are presented which indicate that 152 psychiatric patients receiving posthospital follow-up in the community showed reduced hospital contact and recidivism and increased vocational success and satisfaction. It is concluded that follow-up which offers moderate support and is distinct from the hospital, i.e., community-based, fosters the most independence and adjustment in its participants. (18 ref.)—*Journal abstract.*

6927. **Roe, Anne.** (5151 E. Holmes St., Tucson, Ariz.) **Community resources centers.** *American Psychologist*, 1970(Nov), Vol. 25(11), 1033-1040.—Proposes 2 kinds of community resources centers combining both services and training functions, and offering immediate help or referral to citizens lacking information or skills to cope with a situation. This breadth of approach is made possible by: (a) involving a variety of disciplines; (b) utilizing computer technology for detailed educational and vocational information (i.e., the already functioning Computerized Vocational Information System); and (c)

making referrals to health, welfare, and other established resources. The following university divisions could be involved: business, law, psychology, psychiatry, social work, and vocational and educational counseling. Others could be added. A center for community services is described which is integrated with different university departments such as those listed above, including economics and sociology.—*Author abstract.*

6928. **Salzman, Carl; Shader, Richard I., Scott, Dorothy A., & Binstock, William.** (Harvard Medical School, Boston, Mass.) **Interviewer anger and patient dropout in walk-in clinic.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 267-273.—Examined interviewer attitudes, e.g., liking and anger for patients during initial consultation. Among those assigned "extended diagnostic" at the end of their consultation, it was found that when an interviewer felt angry toward an applicant there was an increased probability that the applicant would not return for a 2nd interview. This group of dropouts was distinguished from the remaining population by a greater percentage of women, non-Caucasians, and members of the lower socioeconomic classes. (16 ref.)—*Journal summary.*

6929. **Satloff, Aaron & Worby, Cyril M.** (U. Rochester, Medical & Dental School) **The psychiatric emergency service: Mirror of change.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1628-1632.—Compared the data collected from the population consulting the Rochester Medical Center psychiatric emergency service during 2 identical time spans 10 yr. apart (1958 and 1968) consisting of 100 consecutive 24-yr periods. It was found that: (a) the service load increased over 49%, (b) more women than men used the service in both years, (c) fewer patients were judged to require hospitalization in 1968 than in 1958, and (d) there was a shift to a younger age group utilizing the service in 1968. Implications of the findings for the planning of an adequate network of community mental health facilities are discussed. (16 ref.)—*P. R. Shibelski.*

6930. **Zuithoff, D.** (Ministry of Cultural Affairs & Social Welfare, The Hague, Netherlands) **Community psychiatry and social action: A survey.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1621-1627.—Defines the role of community psychiatry (presenting its various aspects and various different meanings) and attempts to achieve a viable meaning to ambiguous terms, i.e., "health" and "well-being." 6 workable definitions of community psychiatry are given with the "preventative psychiatry" interpretation favored and expounded upon. The role of the community psychiatrist as he conforms or identifies with the existing sociocultural system is analyzed and scrutinized. Social action and its effectiveness, and of the role of the consultant are briefly described as they pertain to the community's social welfare and well-being.—*P. R. Shibelski.*

GERIATRICS

6931. **Beard, Margaret T. & Bidus, Donald R.** (Veterans Administration Hosp., Augusta, Ga.) **A study of the effects of remotivation on social competence, social interest and personal neatness.** *Journal of Psychiatric Nursing & Mental Health Services*, 1968(Jul), Vol. 6(4), 197-201.—Initiated remotivation techniques on several geriatric wards with a total of 111 patients. The Revised-Nurses' Observation Scale for Inpatient Evaluation was used to assess changes in social com-

petence, social interest, and personal neatness. Results indicate significant improvement of social interest for all Ss and some improvement in social comprehension and personal neatness. Although all Ss responded favorably to some degree, remotivation techniques were most effective for Ss over 60.2 yr. old who had been hospitalized for long time periods, especially in terms of social interest and competence. Although most Ss tended to improve in neatness, none did so to a significant degree.—*Journal summary.*

6932. Dana, Lawrence A., White, Leonard, & Merlis, Sidney. (Central Islip State Hosp., N.Y.) **A new approach to measuring short-term memory in geriatric Ss: A pilot study.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 8-10.—Evaluated the short-term memory of 20 geriatric Ss in a state hospital with a new method. Ss placed figures of a doll family into various rooms of a doll house, and then recalled their placement. Since S recalled his own placement, initial level of learning was assured. Pilot data suggest the measure is reliable even with Ss suffering from both psychiatric and physical illness.—*Journal abstract.*

6933. Haney, J. R., Welsh, D. Kent; Finch, A. J., & Dinoff, Michael. (U. Alabama) **Comparison of age matched regressed patients on the Minimal Social Behavior Scale.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 104.—Attempted to determine whether the Minimal Social Behavior Scale differentiates groups based on age or level of regression. Ss were 30 chronically regressed geriatric neuropsychiatric patients differing only in degree of regression. A statistically significant difference was found between scale means, demonstrating that it can successfully discriminate levels of regression in 2 groups matched for age.—*M. West.*

6934. Oberleder, Muriel. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Crisis therapy in mental breakdown of the aging.** *Gerontologist*, 1970(Sum), Vol. 10(2), 111-114.—Life crises had precipitated institutionalization in all cases in a random selection of state hospital patients, whose "senile" symptoms were successfully treated during a 6-mo period of therapy based upon crisis theory. 12 patients, average age 76.4 yr., all having diagnoses of chronic brain syndrome or arteriosclerosis with psychosis, were exposed to an intensive treatment and practical action program geared toward discharge and expedited by staff, family, and community collaboration. The posthospital adjustment of the discharged patients offers an opportunity for study of the recovery potential of the so-called "hopelessly deteriorated" elderly person. The present study offers alternative interpretations of symptoms commonly attributed to organic impairment and suggests some preventive and treatment approaches.—*Journal abstract.*

6935. Simon, Alexander. (U. California, Medical School, San Francisco) **Physical and socio-psychologic stress in the geriatric mentally ill.** *Comprehensive Psychiatry*, 1970(May), Vol. 11(3), 242-247.—Considers the "interrelationship of physical and mental status in the elderly and the influence on them of a number of sociopsychologic factors." It is concluded that these "patients rarely require just 1 type of treatment or service. The deprivations they suffer are likely to be multiple. What is needed is continuing attention to their overall circumstances and the provision of [the conducive] services . . . to a comfortable, safe, and satisfying life within the limitations of their physical and mental capacities."—*D. Prager.*

EDUCATIONAL PSYCHOLOGY

6936. Adams, Raymond S. (Massey U., Palmerston North, New Zealand) **Location as a feature of instructional interaction.** *Merrill-Palmer Quarterly*, 1969(Oct), Vol. 15(4), 309-321.—Studied videotaped records of live elementary and secondary school lessons. Location of the actors in classrooms indicated that "communicatory behavior was heavily concentrated in the center front of the room and—with ever-diminishing force—in a line directly up the center of the room The greater the distance a location is from the center line of the room and the greater the distance it is from the center front of the room, the less the likelihood that inhabitants of that location will be involved in the direct communication-interaction system."—*R. V. Hamilton.*

6937. Bjerstedt, Åke. (Inst. of Pedagogy-Psychology, Malmö, Sweden) **Två svenska pedagoger.** [Two Swedish research workers in education.] *Pedagogisk-Psychologiska Problem*, 1970(Sep), No. 114, 47 p.—Reviews and discusses the main publications of U. Dahllof and I. Johannesson within the educational and psychological fields.—*English abstract.*

6938. Cellura, A. Raymond. (Rhode Island Coll.) **The application of psychological theory in educational settings: An overview.** *American Educational Research Journal*, 1969(May), Vol. 6(3), 349-382.—Analyzes the atheoretical approach which is characteristic of educational research and presents 2 contrasting philosophies of science which may account for this. The relevance of formal theoretical approaches to the prediction of behavior is examined, particularly some of the difficulties that appear to be associated with the application of contemporary psychological theory in educational settings. The construct systems of several theories are elaborated including similarities and differences in their functional relationships and the implications of these. Attention is given to the applicability of utility-expectancy theory, and to some of the problems and prospects associated with its use in educational research. (5 p. ref.)—*Journal abstract.*

6939. Davis, Frank R. (U. California, Riverside) **Environmental influences on substrates of achievement leading to learning disability.** *Journal of Learning Disabilities*, 1969(Mar), Vol. 2(3), 155-159.—Discusses the view that achievement in school reflects "behavior which happens when the contents of many subability- and valuing-systems have been tied together in an action directed working system." The development of achievement is viewed as the development of hierarchies of subsystems which over time become more efficient working systems and which, when deficient, result in symptoms of learning disability. Implications of this theory for the correlation of the psychological and physiological domains in explaining achievement, and for consideration of the influence of the family, neighborhood, and school in synthesizing the child's available systems are discussed. It is concluded that research guided by substrata theory which probes conceptual, perceptual, emotional, and psychophysiological subsystems to explain the characteristics of school achievement working systems, is "the proper strategy to isolate and determine the interaction among the substrates of achievement."—*M. Maney.*

6940. Higson, C. W. (U. Leicester, School of Education, England) **Finding out about educational**

research. *Educational Research*, 1968(Nov), Vol. 11(1), 31-37.—Provides information on where to find documents concerning educational research in Britain. The British library system is explained and appropriate bibliographic references, research journals, abstracting journals, handbooks, and literature surveys are listed.—R. Wiltz.

6941. Karasick, B., Leidy, T. R., & Smart, B. **Characteristics differentiating high school leaders from nonleaders.** *Purdue Opinion Panel Poll Report*, 1968(May), Vol. 27(3), 18 p.—Administered questionnaires containing 7 biographical data items and 2 personality scales to a total sample of 12,000 high school students. Analysis of a stratified sample of 2000 questionnaires indicate that student leadership, as defined by being captain or cocaptain of a varsity sport, being cheerleader or bandleader, or holding office, is related to 6 of the biographical items in the following manner: the student leader is differentiated from other students in that he is more likely to (a) have a mother who has graduated from high school or college, (b) be a boy, (c) have above-average grades, (d) plan on going to college, (e) be of above-average socioeconomic status, and (f) prefer the Republican party. Neither of the personality scales, 1 of which measured the degree to which events in one's life are considered to be controlled internally or externally, and the other of which was designed to measure alienation from society, were found to relate to student leadership. Additional items relating to the leadership variable were also listed, and an appendix provided a complete item analysis.—R. Wiltz.

6942. Rosenshine, Barak. (Temple U.) **Evaluation of classroom instruction.** *Review of Educational Research*, 1970(Apr), Vol. 40(2), 279-300.—In this review, an attempt is made to describe available instruments for the observation of classroom instruction and to suggest modifications for local evaluation of instruction. Classroom observational instruments are discussed, followed by reviews of category systems. Rating systems and the use of observational systems together with a consideration of the difficulties of their use are discussed. (4 p. ref.)—P. D. Leedy.

6943. Suchodolski, B. **Świat człowieka a wychowanie.** [The world of man and education.] Warsaw, Poland: Książka i Wiedza, 1967. 590 p.—Presents a Marxist analysis of certain philosophical problems of pedagogy, and the characteristics of contemporary youth and their relation to education.—I. D. London.

6944. Waters, Thomas J. & Daugherty, Robert A. (Southern Illinois U., Edwardsville) **Student leadership, mathematics aptitude and college major.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 406.—Hypothesized that college student leaders would (a) score significantly lower on the American College Testing Program Mathematics Usage test, and (b) more frequently select "person oriented" majors than their nonleader counterparts. Ss were 30 male student leaders of junior or senior level and 30 matched controls. Results support both hypotheses.—P. McMillan.

ATTITUDE & ADJUSTMENT

6945. Al-Talib, Nizar M. (U. Illinois) **Attitude: Consonant or dissonant role playing with high or low justification.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 630-631.

6946. Anderson, Carl E. (U. Maryland) **A study of selected psycho-social correlates of college student protesters and non-protesters.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 606.

6947. Anderson, Clifford L. (Ohio U.) **A test to determine the degree to which the school as an attitude object is perceived as masculine by third grade boys.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 638-639.

6948. Croake, James W. & Knox, Frances H. (Florida State U.) **Changing attitudes toward parents and university personnel.** *College Student Survey*, 1970(Fal), Vol. 4(2), 60-64.—Studied the attitudes of college students toward their parents and university administrative personnel. The Nye scale was used to assess the attitudes of 500 Ss toward their parents. A Likert-type scale was constructed to measure the respect of the Ss for the administrative personnel. Both males and females hold a mildly positive attitude toward their parents with the females being more favorable than the males. Upper-class Ss indicated a more favorable attitude toward their parents than the lower-class students. No significant differences were found between the sexes and student classification in their attitudes toward school personnel.—A. J. Ter Keurst.

6949. Douglas, Leonard. (U. Michigan) **A comparative analysis of the relationships between self-esteem and certain selected variables among youth from diverse racial groups.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 641-642.

6950. Hannah, William. (U. Southern California) **Dropout-stayin personality differentials and college environments.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 584.

6951. Harris, Edward E. (Indiana U., Indianapolis) **Conforming and deviant educational attitudes and group position.** *College Student Survey*, 1970(Fal), Vol. 4(2), 33-42.—The extent of conforming, deviant, and ambition-reduction attitudes of college students may vary with respect to their positions in the social structure. Conformation is the endorsement of a cultural goal achieved by educational success. Deviation is the attainment of success by illegitimate means. Ambition reduction is the reduction of the desired level success, if the attainment of success entails the risk of deviant behavior. Ss were 660 junior and senior class students. About 40% were Negro. By the Duncan index Ss were classified into low- and high-social status. Attitudes were measured by Ss' responses to an account of Joe who seeks admission to a medical school. Joe receives "D" grades in a required course. By illegitimate means he can obtain an advanced copy of a crucial examination. He can also reject the fraud and obtain a position as a teacher. Ss' responses indicated "what they would do" if they were in Joe's place. The conforming attitude was dominant among all groups, regardless of color or status. The ambition-reduction was most prevalent among Negro women. The results were in keeping with the idea that innovation was mostly found among deprived groups and conformity was identified with the socially privileged groups.—A. J. Ter Keurst.

6952. Kaufman, James M. (U. Kansas) **Perception of family and school related variables by school adjusted, school disordered, and institutionalized emotionally disturbed preadolescent boys.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 562-563.

6953. **Lievens, Paul.** (Catholic U., Louvain, Belgium) **Approche neuro-psychologique du probleme que pose l'ecolier lymphatique, fatigüé et nerveux.** [Neuropsychological approach to the problem posed by a lymphatic, tired and nervous student.] *Information Psychologique*, 1969(Oct), No. 36, 27-47.—The 3 adjectives are not scientific ones, but rather used commonly by lay people in Belgium. The syndrome they point to can have 3 causes depending on whether the symptoms occurred before school age, whether they occurred as a result of starting school or only later. A number of the factors that could cause "listlessness" or "nervousness" at these 3 stages are discussed. Examples are constitutional factors or family disturbance (Stage I), sensory defects, mental retardation (Stage II), and family conflicts, psychosis (Stage III). This is a general review paper without any references however.—S. G. Vandenberg.

6954. **Luck, James I. & Gruner, Charles R.** (Texas Christian U.) **Note on authoritarianism and critical thinking ability.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 380.—Administered the Watson-Glaser Critical Thinking Appraisal Form YM (W-G) and a 28-item version of the California F Scale to 128 high school students. A negative correlation ($p < .01$) was found between authoritarianism and total W-G scores. W-G subscore correlations indicate that authoritarianism most affects ability to determine whether conclusions logically follow from given information and least affects the ability to recognize assumptions.—*Author abstract.*

6955. **Lundberg, Ulf & Ekman, Goesta.** (U. Stockholm, Psychological Lab., Sweden) **Emotional involvement while anticipating an examination: A psychophysical study.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 603-609.—During a period of 23 days, 51 undergraduates reported on their emotional reaction to an examination taking place at the end of the period; a variant of the method of magnitude estimation was used for this purpose. Scale values of elapsed time were also obtained. Results show that emotional involvement increased as subjective time before the examination decreased. The process could be described by a simple exponential function. (20 ref.)—*Journal abstract.*

6956. **Meredith, Gerald M.** (U. Hawaii) **Public stereotype of the ideal university president.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 588.—Tested agreement among students concerning the attributes of the ideal university president. 131 undergraduates described their concept with Block's Clinical Q Deck. The ideal president was described by the 15 most highly endorsed clinical statements. A checklist for recruitment of administrative personnel is proposed, using the 15 attributes as measures.—*Author abstract.*

6957. **Messer, Stanley.** (Rutgers State U., Psychological Clinic) **Reflection-impulsivity: Stability and school failure.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 487-490.—Studied the stability of the cognitive disposition of 65 boys to be impulsive or reflective over a 2½-yr period. Retest correlations were modest but significant and ranged from .25-.43. Ss who failed a grade were discovered to be significantly more impulsive than their peers, but highly comparable in verbal intelligence. Some possible reasons for the decrease of stability over time might include a differential growth of anxiety over error and the effects of modeling.—*Journal abstract.*

6958. **Mueller, Daniel J.** (U. Illinois) **Differences in**

social responsibility among various groups of college students. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 646-647.

6959. **Musgrove, F.** (U. Bradford, England) **Personal problems in learning environments.** *Educational Research*, 1968(Jun), Vol. 10(3), 235-238.—Investigated the types of problems encountered in the university as compared with those experienced in industrial employment. A problem check list was administered to a random sample of 392 male and 77 female undergraduates, and 173 engineers. 84 of the engineers had received training in industry while the remaining were trained in the university. On the basis of number of problems checked, it was found that (a) females were significantly more worried than males; (b) male arts and social science students were significantly less worried by academic work, but more generally than those enrolled in science and technology; and (c) engineers studying in the university listed significantly more worries than those receiving training in industry.—R. Wiltz.

6960. **Nickel, Horst & Schlüter, Peter.** (Rheinland Pedagogical Coll., Bonn, W. Germany) **Angstwerte bei Hauptschülern und ihr Zusammenhang mit Leistungs- sowie Verhaltensmerkmalen, Lehrerurteil und Unterrichtsstil.** [Anxiety values in schoolchildren and their relationship with performance and behavior characteristics, teacher judgment and teaching style.] *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1970, Vol. 2(2), 125-136.—567 6th and 8th graders in a German school were tested with 2 anxiety scales: the German adaptations of Castaneda's Children's Manifest Anxiety scale and Sarason's Test Anxiety Scale for Children. Teacher style was also judged. Results show differences in age and sex for the anxiety scales (.01 and .05). The style of teaching seems to influence the degree of correspondence between self-ratings and teachers' anxiety ratings. Those students judged by their teachers as being relaxed, emotionally warm, and nondirective tended to have higher anxiety scores on both anxiety scales. (English summary) (21 ref.)—R. F. Wagner.

6961. **Rogers, William R.** (Earlham Coll.) **The alienated student.** Nashville, Tenn.: United Methodist Church, 1969. 74 p. \$1.50(paper).

6962. **Sidorova, A. V.** (Research Inst. of Pediatrics & Child Surgery, Moscow, USSR) **O kharaktere shuma v yasel'nykh gruppakh.** [On the character of noise in day nursery groups.] *Pediatrics*, 1970, Vol. 49(1), 67-70.—Attempted to determine the factors affecting the noise level in the day nursery, and the noise level in the day nursery for children of different ages and at different intervals of time. There is no doubt that degree of excitation in children and their behavior are a direct function of noise level in the group.—I. D. London.

6963. **Treadwell, Thomas W.** (West Chester State Coll.) **Comparing autocratic and democratic leadership techniques for college women.** *College Student Survey*, 1970(Fal), Vol. 4(2), 46-51.—This descriptive report indicates the development of a democratic group climate among 42 female college students. After 25 wk. of this experience, the college administration resolved to place the women in the traditional dormitory setting. The changing attitudes of the Ss indicated a considerable increase in the student attitude that the administration generally treats the students more like children and consequently tends to destroy individual initiative.—A. J. Ter Keurst.

TESTING

6964. Burgess, Thomas C. (Portland State U.) **Evaluation of an IBM card punchboard used as a test answer sheet.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 146.—"Use of the punchboard answer sheet as a final examination for a psychology course was well received by the [23] students but with some reservations by those who became upset by knowing the number of errors they were making. It gave results which were equally reliable and equally variable [with those on traditional answer sheets,] but lower mean scores suggested that it made the test more difficult."—*M. West.*

6965. Cashen, Valjean M. & Leicht, Kenneth L. (Illinois State U.) **Role of the isolation effect in a formal educational setting.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 484-486.—Extended the laboratory finding that setting an item apart from other list items facilitates recall of the item to a formal educational setting. Performance of 40 undergraduates on questions based on statements set apart by underlining was superior to performance on questions about the same statements when they were not underlined. Contrary to many laboratory studies, performance on questions about materials adjacent to materials selected for isolation was better in underlined than in nonunderlined conditions. Results suggest that making materials conspicuous by underlining serves the same function as presenting the material as an advanced organizer.—*Journal abstract.*

6966. Dyer, Henry S., Linn, Robert L., & Patton, Michael J. (Educational Testing Service, Princeton, N.J.) **A comparison of four methods of obtaining discrepancy measures based on observed and predicted school system means on achievement tests.** *American Educational Research Journal*, 1969(Nov), Vol. 6(4), 591-605.—Investigated 4 methods of obtaining discrepancy measures from the actual means and predicted means of school systems on achievement test scores. Method I employed a matched-longitudinal sample and used the scores of the individual students in the regression analyses. Method II employed the same sample but used school system means in the analyses. Methods III and IV also used school system means in the analyses, but in Method III an unmatched-longitudinal sample was used, while in Method IV a cross-sectional sample was used. It is concluded that neither Method III nor Method IV is a reasonable substitute for the 1st 2 methods.—*Journal abstract.*

6967. Fogelman, K. R. (National Foundation for Educational Research, Slough, England) **Modern maths and intelligence tests.** *Educational Research*, 1968(Nov), Vol. 11(1), 71-73.—Investigated the effect on intelligence tests of previous experience with certain mathematical materials and topics. 5 classes of 7-8 yr. old English children were given training for 2 terms with an apparatus designed to promote familiarity with the grouping of objects according to their attributes. 6 classes of comparable children constituted the control group. Of those completing a picture-test pretest as well as posttests consisting of the Lorge-Thorndike Intelligence Test and Raven Progressive Matrices, the experimental group ($N = 61$) scored significantly higher than the control group ($N = 86$) on the Lorge-Thorndike Intelligence Test. It is emphasized that due to methodological weaknesses, including a different pretest and

a small and possibly atypical sample, results should be interpreted cautiously. However, it is concluded that such experience as that given the experimental group seems to improve scores on intelligence tests requiring skills similar to those fostered by the experience.—*R. Wiltz.*

6968. Kelleher, Edward J. (S. C. Johnson & Son, Racine, Wis.) **Differential prediction for non-random subgroups.** *American Educational Research Journal*, 1969(Nov), Vol. 6(4), 633-644.—Investigated the efficacy of prediction of P. Horst's absolute and differential prediction methods when applied to within-groups correlation matrices. 2 treatments of missing data, employing increases of total group intercorrelation matrices and subgroup intercorrelation matrices were incorporated in both the absolute and differential prediction methods. The synthesis of these methods generated 4 composite weighting systems, thus permitting a comparison of the accuracy of predictions resulting from the 4 systems on the basis of weight validities (cross-validation correlation coefficients). (16 ref.)—*Journal abstract.*

6969. Manning, Winton H. (Texas Christian U.) **The measurement of intellectual capacity and performance.** *Journal of Negro Education*, 1968(Sum), Vol. 37(3), 258-267.—Describes the functions, objectives, and interpretations of intelligence and performance tests. Approaches used in removing "culturally linked variance" from tests are also presented. (36 ref.)—*S. Appelle.*

6970. Meuris, G. (Catholic U., Louvain, Belgium) **La mesure du raisonnement dans l'enseignement secondaire: Les tests de raisonnement différentiel.** [Measurement of reasoning in high school education: The differential reasoning tests.] *Information Psychologique*, 1969(Oct), No. 36, 3-25.—The author constructed 4 tests of reasoning: Analyzing the relation between 2 geometric figures in order to apply the same principle to 2 other figures, Verbal reasoning, (verbal analogies), Numerical reasoning (number series), and spatial reasoning (comparing cubes in various orientations). Information is presented on item difficulty, repeat reliability, homogeneity, and internal consistency. The validity is reported separately for samples of boys and for girls in the 6 classes of 2 types of high schools: the classical lyceum type and the modern type. The criterion was the global success at the end of the year. These 24×4 validity coefficients range from .07 to .50, with generally higher values for girls than for boys. Congruent validity was demonstrated by correlations with other tests, ranging from .33 to .77. Factor analytic information is given showing that the tests measured relatively independent factors. Included are Z scores, T scores, and percentiles for 3 of the tests for the 1st yr. of teachers' college.—*S. G. Vandenberg.*

6971. Mitzel, Margaret A. (U. Maryland) **An experimental study of the effect of specific experiences on test-retest correlations.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 611.

6972. Sjogren, Douglas D. (U. Illinois) **Measurement techniques in evaluation.** *Review of Educational Research*, 1970(Apr), Vol. 40(2), 301-320.—This review presents a consideration of measurement of inputs or antecedents. Measurement of processes of transactions, measurement of outcomes, and measurement strategies are also discussed. (6 p. ref.)—*P. D. Leedy.*

6973. Sweet, Roger C. (U. Wisconsin) **Variations in the intelligence test performance of lower-class**

children as a function of feedback or monetary reinforcement. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 648-649.

6974. Wallner, Teut. **Der prognostische Wert von Tests und Handschriftenvariablen bei Eignungsuntersuchungen.** [The prognostic value of tests and handwriting variables in aptitude testing.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(2), 316-356.—The final grades of 134 participants in a course for clerical workers were used as criteria in the evaluation of the predictive value of a test battery. The addition of 17 variables extracted from the handwritten curricula vitae of Ss increased the predictive power of the initial tests considerably, although no significant correlations were found between the results of the test battery and the handwriting variables. (English & French summaries)—*W. J. Koppietz*.

6975. Ward, J. (U. Manchester, England) **On the concept of criterion-referenced measurement.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 314-323.—Discusses the distinction between norm- and criterion-referenced measurement, emphasizing inter-S variability. 3 important areas of application are suggested: curriculum development, the assessment of developmental levels, and the construction of diagnostic/remediation programs. Psychometric issues surrounding the selection of criteria and suitable items are considered with reference to these, and the possibility of individual item-sampling procedures is mentioned. It is considered that criterion-referenced test construction will require a change of emphasis from the assessment of individual differences to the identification of learning criteria and individual performance relative to these. (35 ref.)—*Journal abstract*.

6976. Zimmerman, Irla L. & Woo-Sam, James. **The utility of the Wechsler Preschool and Primary Scale of Intelligence in the public school.** *Journal of Clinical Psychology*, 1970(Oct), Vol. 26(4), 472.—Compared the test performances on the Wechsler Preschool and Primary Scale of Intelligence (WPPSI) and the Stanford-Binet LM (SB-LM) of 2 groups of typical referred kindergartners and 1st graders. Results suggest that similar results may be obtained from the SB-LM or WPPSI below the superior level. IQs were significantly higher for gifted children with an IQ of 170 on the SB-LM corresponding to a Full Scale IQ of 155 on the WPPSI. A mean Binet IQ of 129 corresponded to a WPPSI Full Scale score of 117.—*E. J. Kronenberger*.

SPECIAL EDUCATION

6977. Abrams, Naomi & Pieper, William. **Experiences in developing a pre-school program for neurologically handicapped children: A preliminary report.** *Journal of Learning Disabilities*, 1968(Jul), Vol. 1(7), 394-402.—Describes the work of an evaluation center stressing the development of a constructive program for the rehabilitation of children with neurological handicaps.—*Journal abstract*.

6978. Ayres, A. Jean. (U. Southern California) **Deficits in sensory integration in educationally handicapped children.** *Journal of Learning Disabilities*, 1969(Mar), Vol. 2(3), 160-168.—Subjected 64 neuromuscular, perceptual, and cognitive measurements made on 36 children with educational handicaps to Q-technique factor analysis. The 2 major patterns of

deficits associated with low academic achievement were (a) auditory, language, and sequencing; and (b) postural and bilateral integration. Both of these syndromes were differentiated from syndromes of apraxia and tactile defensiveness. (17 ref.)—*Journal abstract*.

6979. Budnick, Albert. (Columbia U.) **Differences between teachers and clinicians in the perception of clinical services in special schools for socially maladjusted children.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 557.

6980. Coleman, Howard M. & Dawson, Sarah T. (Rhode Island Public Schools, Rumford) **Educational evaluation and visual-perceptual-motor dysfunction.** *Journal of Learning Disabilities*, 1969(May), Vol. 2(5), 242-251.—Describes some problems in testing and test interpretation that influence the placement of children with visual-perceptual-motor problems in the educational setting, and provides a frame of reference for general educators regarding validity, reliability, and accuracy of test yield and interpretation. It is pointed out that psychological, achievement, and readiness tests measure performance, not innate capacity, and therefore, should be used as predictors of academic achievement for Ss with visual-perceptual-motor problems only if therapeutic intervention does not take place. Because of the wide use of the Stanford-Binet Intelligence Scale and the WISC, the construction and scope of these tests are examined to show how children with visual-perception-motor problems may perform on them. It is emphasized that educators must be aware of the limitations and basic statistical considerations inherent in testing these children. It is concluded that perhaps "these children might profit from a more wide-spread acceptance that their problems partially defy measurement by current instruments, and that interpretations of these partial measurements are often sufficiently incorrect to insure mis-diagnosis, mis-labeling, and mal-education."—*M. Maney*.

6981. Jaffrain, Daniele. (U. Rennes, France) **Contribution à l'étude de la rééducation des asphasiques à partir de l'approche linguistique du problème de l'aphasie.** [Contribution to the study of reeducating aphasics by a linguistic approach to the problem of aphasia.] *Information Psychologique*, 1968(Jul), No. 31-32, 35-62.—Presents a historical review and some ideas of De Saussure on linguistics with specific examples (in the French language) of the types of errors made. Also given are detailed protocols of a patient seen for several years.—*S. G. Vandenberg*.

6982. Meshcheryakov, A. I. (Inst. of Defectology, Moscow, USSR) **Iz istorii obucheniya slepoglukhonemykh detei.** [From the history of teaching blind deaf-mute children.] *Spetsial'naya Shkola*, 1969, No. 1, 89-99.—Presents a reanalysis, "from the point of materialist psychology," of the teaching process applied to Helen Keller, taking into account those factors which have been overlooked by previous investigators.—*I. D. London*.

6983. Pannbacker, Mary. **A speech pathologist looks at learning disabilities.** *Journal of Learning Disabilities*, 1968(Jul), Vol. 1(7), 403-409.—Discusses the current professional disagreements related to learning disabilities, the role and scope of speech pathology in the assessment and remediation of learning disabilities, and a review of the literature regarding the terminology of learning disabilities. The chart of the nomenclature used in the field of learning disabilities giving term, author,

and date of publication gives a clear and concise overview of the literature.—*Journal abstract.*

6984. Senf, Gerald M. & Feshbach, Seymour. (U. Illinois, Chicago) **Development of bisensory memory in culturally deprived, dyslexic, and normal readers.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt.1), 461-470.—2 experiments assessed whether 2 samples of inadequate readers were functionally similar on certain memory and attention processes. 64 elementary and junior-high culturally deprived, learning-disabled, and 32 normal control readers remembered 3 pairs of simultaneous, discrepant auditory and visual digits. In free recall, all Ss tended to recall the 6 digits in 2 modality sets at both ages though the older culturally deprived and normal control Ss ordered the digits into 3 audiovisual pairs when induced to do so while the learning disabled were insensitive to the set induction. In directed recall, culturally deprived Ss and normal controls were again more similar; older culturally deprived Ss and normal controls recalled digits in pair order more accurately than their younger counterparts while older learning-disabled Ss were no better than the young learning-disabled Ss. Though generally similar to the normals, the young culturally deprived Ss resembled the learning disabled in modality recall. Findings suggest that the learning disabilities of culturally deprived and learning-disabled samples are functionally different. (19 ref.)—*Journal abstract.*

Gifted

Remedial Education

6985. Ames, Louise B. (Gesell Inst. of Child Development, New Haven, Conn.) **Children with perceptual problems may also lag developmentally.** *Journal of Learning Disabilities*, 1969(Apr), Vol. 2(4), 205-208.—25 2nd graders judged on the basis of the Bender Gestalt to be in need of perceptual training, and given such training in a classroom setting, were compared with 25 controls before and after training, on the Gesell Incomplete Man Test and the Lowenfeld Mosaic. Before training Ss were on the average from 16.6-23.8 mo. behind the average expectation of 2nd graders. Even after 6 mo. of training, they remained far behind the average age expectations. However, Ss who received perceptual training did make relative gains, while Ss in the control group fell farther behind. It is concluded that perceptual training can help a child who is lagging developmentally to perform at his highest potential developmental level, though it seems unlikely that perceptual training actually speeds up development. Results also suggest that children with perceptual problems may be behind expected age level developmentally, and that children who are functioning substantially below their expected age level may fall behind increasingly unless some curative measures are provided.—*Journal summary.*

6986. Cromer, Ward. (Wellesley Coll.) **The difference model: A new explanation for some reading difficulties.** *Journal of Educational Psychology*, 1970(Dec), Vol. 61(6, Pt. 1), 471-483.—Described 4 models for accounting for reading difficulty: defect, deficit, disruption, and difference. Poor readers fitting 2 of these models, a Difference group (assumed to read word-by-word) and a Deficit group (assumed to have

relatively inadequate vocabulary skills) were compared with each other and with good readers. Ss were 64 male undergraduates. As hypothesized, the Difference group but not the Deficit group read as well as good readers when material was presented in preorganized phrases. Results support the notion that 1 source of comprehension difficulty can be attributed to a difference in the way some poor readers organize reading input. Implications for differential diagnosis, remediation, and research are discussed.—*Journal abstract.*

6987. Frostig, Marianne & Orpet, Russel E. (U. Southern California) **Four approaches to the diagnosis of perceptual disturbances in reading disability.** *British Journal of Disorders of Communication*, 1969(Apr), Vol. 4(1), 41-45.—Discusses 4 approaches to the study of perception and evaluation of perceptual functions: the psychosocial, the neuropsychological, the developmental, and the functional evaluation. It is postulated that these viewpoints should be combined and that preferred treatment will depend on the total findings in each particular case. Perceptual disturbances should be evaluated and treated intensively as well as extensively. It is also suggested that a readiness program which integrates these 4 viewpoints will in many cases prevent learning difficulties. Such a program will consider the child's psychosocial development and will use teaching methods and methods of classroom management based on present knowledge of brain functions. It will consider all psychological functions and integrate perceptual training with sensorimotor, language training, and development of higher thought processes, and it will analyze perceptual functions into their components to emphasize training of lagging functions. (20 ref.)—*M. Maney.*

6988. Griffiths, C. P. (John Horniman School, Worthing, England) **A follow-up study of children with disorders of speech.** *British Journal of Disorders of Communication*, 1969(Apr), Vol. 4(1), 46-56.—49 7-16 yr. old children who received concentrated speech therapy and remedial education were followed up to assess their progress in speech and language development, school attainment, and social and emotional adjustment. After completion of the program, 26 Ss were recommended for ordinary school. 7 of these were receiving remedial teaching and of the 19 who remained in ordinary schools, 2 were 2-4 yr. backward, 12 were in low streams, and only 5 were maintaining satisfactory progress. Results indicate that failure to maintain progress after specialized teaching ceased could not be explained by level of speech and language development at that time or by intelligence. It is suggested that earlier difficulties, although resolved at a symptomatic level, are a continuing disability and that a common etiological factor is minimal cerebral dysfunction which may be a hidden and persisting handicap in Ss who give a superficial appearance of normality.—*M. Maney.*

6989. Jones, Joyce. (Carpenter No. 2 School, Perceptual Development Center, Natchez, Miss.) **Dyslexia: Identification and remediation in a public school setting.** *Journal of Learning Disabilities*, 1969(Oct), Vol. 2(10), 533-538.—Reports on a 3-yr experimental program which successfully attempted to determine if children with dyslexia could be remediated by the use of a structural-linguistic approach taught on a 1-to-1 basis through the use of paraeducational personnel under supervision. Test-retest data show that the training improved reading skills, and that this gain was retained

or further improved after dismissal from the program.—*M. Maney.*

6990. Lewis, James N. (West Texas Education Center, Midland) **The improvement of reading ability through a developmental program in visual perception.** *Journal of Learning Disabilities*, 1968(Nov), Vol. 1(11), 652-653.—Reports a pilot study which evaluated a program of therapy designed to aid children with reading disability. The Frostig Program was administered over a 10-wk period to 5 2nd grade males who exhibited severe reading difficulties. Based on pre- and posttest criteria consisting of the SRA Reading Test and the Frostig Test, results indicate improvement in each area of visual perception. However, due to the limited number of Ss, the mean gains were not significant except in eye-motor coordination. From evidence showing a group rise in reading ability from the 48th to the 80th percentile, it is concluded that "the Frostig Program should receive consideration as a possible therapeutic program for ... youngsters exhibiting reading difficulties."—*M. Maney.*

6991. O'Donnell, Patrick A. & Eisensohn, Jon. (San Francisco State Coll.) **Delacato training for reading achievement and visual-motor integration.** *Journal of Learning Disabilities*, 1969(Sep), Vol. 2(9), 441-447.—Investigated the effects of Delacato training, a motor training program, on the reading achievement and visual-motor integration of 60 7-10 yr. old disabled readers with crossed or uncertain lateral expression. Ss received either Delacato recommended training, limited Delacato training, or selected physical education activity (control). Results based on analysis of variance for mean gains as measured by the Gray Oral Reading Test, the Stanford Diagnostic Reading Test, and the Developmental Test of Visual-Motor Integration show no statistically significant gains for either experimental group over the control group in reading achievement or visual-motor integration. The most consistent pattern that emerged was on comparison of mean gain scores of reading ability where young Ss tended to show greater gains than older Ss. Various limitations of the experimental design employed are discussed, and it is suggested that some modifications be considered before a replication is undertaken. (18 ref.)—*M. Maney.*

6992. Silberberg, Norman E. & Silberberg, Margaret C. (Kenny Rehabilitation Inst., Minneapolis, Minn.) **Myths in remedial education.** *Journal of Learning Disabilities*, 1969(Apr), Vol. 2(4), 209-217.—Discusses why research outcomes in the area of remedial education are so diverse from the actual programs being carried out, and recommends a reallocation of priorities for the education of children with learning difficulties.

6993. Stephen, Patricia. (Ludwigsburg Elementary School, New York, N.Y.) **Teaching reading by typing.** *Journal of Learning Disabilities*, 1968(Jul), Vol. 1(7), 419-422.—A case report of a disabled reader who was helped considerably with his reading by typing.—*Journal abstract.*

Sensory & Physical Handicaps

6994. Flanigan, Patrick J. & Joslin, Elizabeth S. (U. Wisconsin, Center on Behavioral Disabilities) **Patterns of response in the perception of Braille configurations.** *New Outlook for the Blind*, 1969(Oct), Vol. 63(8), 232-244.—Attempted (a) to measure the interval be-

tween braille stimulus presentation and response on a programed tachistoscopic instruction device, and (b) to determine the efficacy of the device as a teaching machine. 27 visually handicapped underwent 2 phases of experimentation. The presentation phase identified the optimal range of perception and ranked the 26 letters according to difficulty. The remediation phase employed the normative data developed in Phase 1 and attempted to devise a method whereby rapid presentation and discrimination of single-cell configurations could be attained. Results of the experiment were (a) that the optimal speed of presentation of braille configurations is .6 sec., (b) that certain letters are more difficult than others, and (c) that the difficulty of these letters could be slightly lessened by remediation. Treatment effects on traditional braille reading ability was increased by 5.7 words/min due to remediation. It is concluded that the automated learning device may be potentially beneficial in teaching people to read braille. (18 ref.)—*B. A. Burkard.*

6995. Margach, Charles & Kern, Kate C. (Pacific U., Low Vision Clinic) **Visual impairment, partial-sight and the school psychologist.** *Journal of Learning Disabilities*, 1969(Aug), Vol. 2(8), 407-414.—Discusses the utilization of the standard WISC for partially-sighted children. Special techniques in administration and interpretation are presented and evaluated in light of 10 yr. accumulation of records of testing partially-sighted children.—*Journal abstract.*

6996. Viskant, Kathryn; Rex, Evelyn, & Livers, David. **Vocational counseling of the visually handicapped in Illinois high schools.** *New Outlook for the Blind*, 1969(Oct), Vol. 63(8), 251-254.—The special teacher and the high school guidance counselor are the main sources of vocational counseling on the secondary level. 32 questionnaires with multiple choice questions were sent to special teachers of the blind and guidance counselors having programs for the visually handicapped in secondary schools in Illinois. The questionnaire covered the following areas: (a) specific information from the special teachers and counselors, (b) vocational counseling practices, (c) testing procedures, (d) sources of occupational information, (e) resources from outside the school, and (f) present needs and problems. 81% of the questionnaires were returned. Results suggest 2 main sources of vocational counseling for the visually handicapped: formal vocational counseling by the guidance counselor and informal by the special teacher. Other conclusions based on the data received are included. "The study showed that the responses of the special teachers and the guidance counselors were enthusiastic, indicating that they were interested in providing good vocational counseling to visually handicapped students."—*B. A. Burkard.*

Mental Retardation & Learning Disorder

6997. Adams, Richard B. (901 17th St., NW, Washington, D.C.) **Dyslexia: A discussion of its definition.** *Journal of Learning Disabilities*, 1969(Dec), Vol. 2(12), 616-633.—Discusses various definitions of dyslexia to point out how difficult it is to arrive at a definition that is acceptable to all. The necessity for a clear and concise definition is emphasized so that a workable solution to the problem is possible. (23 ref.)

6998. Barrington, Byron L. (U. Wisconsin, Wausau) **Special education students. How many are mis-**

placed. *Journal of Learning Disabilities*, 1968(Dec), Vol. 1(12), 726-729.—Examined WAIS test protocols of 20 16-20 yr. old rehabilitation referrals who had been in special education classes to investigate how many were really not retarded and had been misplaced in these programs. Results show that the intellectual functioning of 25% of Ss at the time of referral was above the limit supposedly set for placement in retarded classes, and that all these Ss were males. Suggestions for modifying the evaluation procedures for special education classes are presented.—M. Maney.

6999. Carter, Darrel B. (Ed.) (U. California, School of Optometry, Berkeley) **Interdisciplinary approaches to learning disorders: A symposium by thirteen contributors.** Philadelphia, Pa.: Chilton, 1970. xii, 191 p. \$8.95.

7000. Egg-Benes, Maria. (Zurich Schools for the Mentally Retarded, Switzerland) **Rehabilitation of slow learners in Switzerland.** *Journal of Learning Disabilities*, 1968(Dec), Vol. 1(12), 729-734.—Describes how a nation's societal structure and cultural aggregates determine what educational demands and standards will be enforced in public schools, and discusses reasons why children who cannot meet these demands should not be compelled to do so, but should be given special training. The history of special education in Switzerland is briefly outlined and the rationale, organization, and programs of present day special education classes are described.—M. Maney.

7001. Heckerl, John R. & Webb, Susan M. (Waterford Schools, Mich.) **An educational approach to the treatment of children with learning disabilities.** *Journal of Learning Disabilities*, 1969(Apr), Vol. 2(4), 199-204.—Describes the development and some initial results of an interdisciplinary approach for children with learning problems in a public school setting. The objectives of the program are identified as early identification, diagnosis, and treatment of children who experience learning difficulties in kindergarten-3rd grade in an attempt to increase effectiveness of remediation and prevent other difficulties. The diagnostic and treatment services and the roles of staff members are discussed. 1st-yr results based on pre- and posttest scores on oral reading, word pronunciation, and spelling tests indicate that "young children can profit from special instruction and that this instruction need not be delayed in the hope that developmental readiness alone will help the child to read." Several problems which became apparent during the course of the program are identified as areas requiring further study.—M. Maney.

7002. Hoops, M. Dean. (U. Michigan) **A study of the effects of video-tape feedback upon the verbal behavior of teachers in classes for the mentally handicapped.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 663.

7003. Kappelman, Murray M., Kaplan, Eugene, & Ganter, Robert L. **A study of learning disorders among disadvantaged children.** *Journal of Learning Disabilities*, 1969(May), Vol. 2(5), 262-268.—A multi-disciplined team of medical, psychological, hearing, language, and educational specialists evaluated learning disorders in 306 disadvantaged children. Evaluation was based on information from: (a) school reports outlining behavioral and learning patterns; (b) separate interviews with parents and Ss; (c) pediatric examinations followed by psychiatric or neurologic consultation as indicated; (d) audiometric and visual screening; and (e) psychometric, language, and articulation tests. Results show

that 55.6% of Ss had organic learning handicaps and 44.4% had functional learning handicaps. Approximately 25% of Ss had significant emotional disturbance as the predominant cause of their inability to learn. 4 case reports are presented to illustrate the mechanism of diagnosis selection. It is concluded that, in view of the high rate of neurologically based disabilities in children from urban slum areas, the rehabilitative and remedial programs designed for this population need to be reevaluated.—M. Maney.—M. Maney.

7005. Košč, Ladislav. (Research Inst. of Child Psychology & Pathopsychology, Bratislava, Czechoslovakia) **Psychology and psychopathology of mathematical abilities.** *Studia Psychologica*, 1970, Vol. 12(2), 159-162.

7006. Kreider, James M. (U. Michigan) **The effect of computer assisted teacher training system feedback on increasing teacher use of pupil ideas with EMR children.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 655-656.

7007. Landreth, Garry L., Jacquot, Willard S., & Allen, Louise. (North Texas State U., Pupil Appraisal Center) **A team approach to learning disabilities.** *Journal of Learning Disabilities*, 1969(Feb), Vol. 2(2), 82-87.—Argues that the occurrence of learning disabilities in children is likely to reflect difficulties that are interrelated rather than isolated in nature. It is suggested that an interdisciplinary team is required to successfully provide the kind of remediation necessary for diagnosing and correcting learning difficulties. The university and public school are presented as communities capable of providing the services necessary for a successful team approach. Factors affecting the success of team cohesiveness, and specific diagnostic and therapeutic procedures are also discussed.—S. Appelle.

7008. Lewis, Franklin D., Bell, D. Bruce, & Anderson, Robert P. (Arkansas Polytechnic Coll., Russellville) **Relationship of motor proficiency and reading retardation.** *Perceptual & Motor Skills*, 1970(Oct), Vol. 31(2), 395-401.—Studied the relationship of motor and reading proficiency in a group of 100 junior high school males. 2 reading conditions, adequate and inadequate, and 2 racial samples, Negro and Caucasian, were employed. Motor performance was significantly different for the 2 reading groups but was not for the 2 racial ones. The findings are discussed in light of current explanations of learning disorders. (15 ref.)—*Journal abstract.*

7009. Lovitt, Thomas C., Kunzelmann, Harold P., Nolen, Patricia A., & Hulten, William J. (U. Washington) **The dimensions of classroom data.** *Journal of Learning Disabilities*, 1968(Dec), Vol. 1(12), 710-721.—Describes how behavioral modification techniques may be employed to increase academic performance through a 3-phase procedure of data diagnosis, data programing, and data decisions. A method of obtaining pupil performance data and information concerning relevant variables of the teacher-pupil dyad is described. A 2nd method is presented whereby pupil and teacher data may empirically enable the teacher to evaluate curricular materials. The use of data in making classroom managerial decisions is discussed.—*Journal abstract.*

7010. Scagliotta, Edward G. (Midland School, North Branch, N.J.) **Reporting progress of the learning disabled child.** *Journal of Learning Disabilities*,

1969(Jul), Vol. 2(7), 345-362.—Presents a uniform inventory of general categories and specific suborders for recording maturative gains subsequent to initiation of a planned learning program. In addendum to illustrate content and style, authentic progress reports are offered, representative of CA and program groupings.—*Journal abstract*.

7011. Schiller, Jerome J. & Deignan, Margaret C. (Fairfield U., School of Education) **An approach to diagnosis and remediation of learning disabilities.** *Journal of Learning Disabilities*, 1969(Oct), Vol. 2(10), 509-519.

7012. Schwalb, Eugene; Blau, Harold, & Blau, Harriet. **Child with brain dysfunction.** *Journal of Learning Disabilities*, 1969(Apr), Vol. 2(4), 182-188.—Discusses criteria and tests used to diagnose brain dysfunction, and deals with remedial procedures and materials pertaining to a combination of the visual, auditory, kinesthetic, and tactile modalities. A theory of new education and not remediation is discussed, and the techniques presented are described as part of the process whereby educators have gained access to 1 segment or another of the originally undifferentiated groups of nonlearners. It is stressed that the ultimate goal of this process is "the day when the organization of appropriate material will be accomplished by prescription to insure mastery by the learner in terms of his special capacities."—*M. Maney*.

7013. Shearer, E. **Physical skills and reading backwardness.** *Educational Research*, 1968(Jun), Vol. 10(3), 197-206.—Established norms for skills related to specific dyslexia in 225 7-10 yr. old British school-children, and compared these norms to the performance of 114 backward readers aged 8 yr. and above. The retarded group was found to have a considerably higher proportion of individuals demonstrating (a) mixed handedness and weak hand preference, (b) difficulty in consistent right-left discrimination, and (c) poor scores on a 50-item finger localization test. The 2 groups did not differ in the proportion of strongly left-handed Ss, and both groups had in common an increase in ability with age on tests of right-left discrimination and finger localization. A considerable amount of overlap was found between the 2 groups for all tests at all ages. (55 ref.)—*R. Wiltz*.

7014. Weaver, Phillip A. (U. Michigan) **Effects of a computer assisted teacher training system and teacher expectancies on teacher-pupil verbal interaction with EMR children.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 657.

7020. Erlick, A. C. (Purdue U.) **Counseling needs of high school students.** *Purdue Opinion Panel Poll Report*, 1968(Dec), Vol. 28(2), 26 p.—To define the counseling needs and objectives of high school students, questionnaires were administered to over 13,000 students. Results were based on data from a stratified sample of 2000 questionnaires. Ss with an elaborate "style of life," as defined by having parents in leadership positions, by participating to a high degree in extracurricular activities, and by extreme academic achievement, were found to (a) engage in leisure activities covering a broad range of formal skill requirements, (b) believe that they exert influence in family decisions which affect them, (c) come from families with a high income level, (d) have voluntarily seen their counselor several times in the past year, (e) feel concern for vocational decision-making and want more help with these decisions, and (f) regard parents and counselors as sources of help with vocational decisions. Ss with "restricted styles of life reported nearly the opposite set of attitudes and characteristics." An appendix provides a complete analysis of responses to each questionnaire item.—*R. Wiltz*.

7021. Häyrynen, Yrjö P. **The flow of new students to different university fields: Career motivation, educational choice and discriminating effects of university admission: A study of Finnish female students.** *Annales Academiae Scientiarum Fennicae*, 1970, Vol. B-168, 142 p.—Reports a series of studies in which factor analysis was used to obtain dimensions of vocational preferences and in which multiple discriminant analysis of 19 career groups was used. The tests used were local ones but based on the National Merit Scholarship questionnaire, the CPI, Cattell's 16 PF, the Maudsley questionnaire, the Barron-Welsh Art scale, and a semantic differential of the self-concept plus an adaptation of the Kuder Vocational Preference Record. The results are related to Holland's theory of vocational-personality types. (118 ref.)—*S. G. Vandenberg*.

7022. Klein, J. P., Quarter, J. J., & Laxer, R. M. (6300 Overbrook Ave., Philadelphia, Pa.) **Behavioral counseling of underachievers.** *American Educational Research Journal*, 1969(May), Vol. 6(3), 415-424.—Attempted to alter the behavior of 60 male 7th and 8th grade male underachieving students by giving them training in either n Achievement, moderate risk taking, or both. At the end of the 4-mo remedial program no significant improvement was found in GPA or in independent measures of the 2 training variables. It is concluded that training in n Achievement and risk taking is not generalizable to the academic situation.—*Journal abstract*.

7023. Lewis, Michael D. (U. Michigan) **A study of the relative effects of counseling and consultation upon personal and social adjustment, sociometric status, and achievement-oriented behavior of third grade children.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 609-610.

7025. McFie, J. & Thompson, J. A. (Guy's Hosp., Dept. of Child Psychiatry, London, England) **Intellectual abilities of immigrant children.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 348-351.—Compared test scores on the WISC and Schonell Graded Word Reading Test of 61 children of West Indian parents attending a child guidance clinic with results of a similar number of English controls. The scores were also compared of those West Indians who had arrived in the United Kingdom before and after the age of 5 yr. Significant differences were found on vocabulary and on 4 of the 5 performance subtests, and the early arrivals tended to do better on the subtests which had been done relatively badly by all immigrant children. It is concluded that: (a) teaching with constructional and geometrical material is at least as important for immigrant children as is language teaching, and (b) intelligence testing of these children can lead to serious misclassification unless cultural factors are considered.—*Journal abstract*.

7026. Minde, Klaus K. & Werry, John S. (McGill U., Montreal, Quebec, Canada) **Intensive psychiatric teacher counseling in a low socioeconomic area: A controlled evaluation.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 595-608.—The classroom behavior of 20 normal and 40 disturbed 3rd-7th graders from a low socioeconomic neighborhood school was rated objectively by Os using a frequency counting technique. The method of measurements discriminated significantly between normals and disturbed Ss in all but 1 category of behavior. Following an initial or base-line observation period, 20 of the disturbed Ss were given an intensive period of treatment. All Ss were reevaluated at the end of treatment and 1, 3, and 12 mo. later. There was no overall treatment effect, though independent global ratings did suggest some benefit from treatment. Findings are discussed in view of the limitations inherent in the school system, duration of treatment, and the involvement of the total family.—*Journal summary*.

7030. Tatsuoka, M. M. & Cattell, R. B. (U. Illinois) **Linear equations for estimating a person's occupational adjustment, based on information on occupational profiles.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 324-334.—There are broadly 2 models for vocational guidance, estimating, respectively, the "efficiency" of the individual against a performance criterion and "belongingness or adjustment" based on similarity to the typical member. The former has attractions of positiveness, but data for the latter are easier to obtain. With certain reasonably acceptable assumptions, mean occupational profile data can be used via the point-biserial to get regression equations permitting the more convenient usage of the efficiency approach (though the criterion is still adjustment). An illustrative example is worked, how the proposed adjustment score functions is discussed, and a tentative decision rule is stated.—*Journal abstract*.

7034. Bolton, Dale L. (U. Washington) **The effect of various information formats on teacher selection decisions.** *American Educational Research Journal*, 1969(May), Vol. 6(3), 329-347.—Investigated effects of 4 information-format variables on the teacher selection decision process. The experiment was conducted in a simulated situation, and 144 elementary school principals made decisions regarding fictitious applicants for a hypothetical position. Variables manipulated were: instructions for processing information, number of documents, masking of information, and interview information. Measures used to determine the effect of these variables were: consistency of decisions, fineness of

discriminations made, time required to make decisions, and feeling of certainty regarding decisions. The design was a $2 \times 2 \times 3 \times 3$ factorial for which analysis of variance was used in analyzing data. Results indicate that the format of the information did affect decisions. The optimum format consisted of: instructions regarding the processing of information, a single summary document, no masking of information, and interviews with audiovisual stimuli.—*Journal abstract.*

(Tufts U.) **Teachers of disturbed preschool children: An analysis of teaching styles.** *American Journal of Orthopsychiatry*, 1969(Jul), Vol. 39(4), 609-618.—Observations of 2 experienced teachers of disturbed children suggest the possibility of developing a coding system for differentiating between teaching styles. Pilot efforts are presented, and questions posed about philosophies of teaching in therapeutic nursery schools which may help to refine training methods in this relatively new field.—*Journal abstract.*

7036. Brody, E. B. (Rutgers State U., Graduate School of Education) **The effects of creativity and intelligence on teacher ratings.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 342-344.—Studied the relationships between creativity and intellectual ability of student teachers and ratings of their effectiveness by pupils who differ in social class and creativity. Ss were 19 male and 26 female students, rated by a total of 1863 students in their classes. IQ ratings were based on College Entrance Examination Board-Verbal scores; creativity, on Mednick's Remote Associate Test (RAT). RAT was also administered to all secondary school students participating. Occupation of the head of the household was used to determine social class. Results indicate that teachers who score high on indices of intellectual ability and creativity or low on both of these indices are rated more favorably by their pupils than teachers who score high on only 1 of these indices. Teachers who score high or low on both indices are rated more favorably by pupils high in creativity and high in social class.—*Journal abstract.*

7040. Hiller, Jack H., Fisher, Gerald A., & Kaess, Walter. (Night Vision Lab., Ft. Belvoir, Va.) **A computer investigation of verbal characteristics of effective classroom lecturing.** *American Educational Research Journal*, 1969(Nov), Vol. 6(4), 661-675.—Explored the feasibility of employing an electronic computer to search transcripts of teachers' lectures for verbal correlates of effective performance. A set of 5 factors, constructed from 35 categories of verbal behavior, were hypothesized to have importance for successful lecturing,

and to be capable of computer identification. The lecture data were keypunched and then scored by computer for degree of category and factor representation. These scores were then correlated with the effectiveness criterion. 1 factor termed vagueness correlated negatively with the criterion in 2 sets of lectures, and also appeared as a highly consistent instructor trait across 2 lectures. A verbal fluency factor displayed lower, but significant, criterion correlation and consistency. Factors indicating amount of information and interest achieved statistically significant correlation in the 2nd lecture but not in the 1st.—*Journal abstract.*

7051. Bayer, Alan E. (American Council on Education, Washington, D.C.) **The college drop-out: Factors affecting senior college completion.** *Sociology of Education*, 1968(Sum), Vol. 41(3), 305-316.—Presents a follow-up study of 8567 Project TALENT students who had attended senior college within 5 yr. after high school graduation; the relative influence of 38 personal and background factors are examined as they relate to college completion. Aptitude measures and marriage and family variables are shown to be primary determinants of progress through college. However, inclusion of all 38 variables in a multiple regression prediction equation accounted for less than 30% of the variance in dropping out vs. completing senior college for women, and less than 20% of the variance in this criterion for men. While the variables employed yield results which are a considerable improvement over the results of other prediction studies, the degree of accuracy in prediction is not sufficient to be applicable in educational guidance and policy considerations.—*Journal abstract.*

7052. Borger, Valbur. (U. Wisconsin) **The predictive**

association between the ego-stage and group-relevant aspects of personality and learner satisfaction and learning achievement on the basis of the degree of congruence in teacher-learner dyads in adult learning courses. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 601.

7053. Choppin, Bruce. **Social class and educational achievement.** *Educational Research*, 1968(Jun), Vol. 10(3), 213-217.—Discusses some possible reasons for the recent findings by the International Association for the Evaluation of Educational Achievement that of 12 countries the largest discrepancy between social groups in mathematics performance existed in England. The findings could not be accounted for in terms of poor data reliability or validity or errors of classification. A determining factor was found to be the relative proportions of grammar and modern school children in the different social classes; modern school children, who performed poorly in mathematics, were found to come from predominately blue-collar families; direct grant, independent, and grammar school children who performed well in mathematics came from white collar and professional families. Another possible factor involves the unusually large proportion of blue collar children, relative to children from professional families, who dropout of school. However it is concluded that "there is no simple answer.... The outstanding result for England is probably the outcome of a number of different factors acting together."—*R. Wiltz.*

7054. Erickson, Richard C. **Visual-haptic aptitude: Effect on student achievement in reading.** *Journal of Learning Disabilities*, 1969(May), Vol. 2(5), 256-260.—Investigated whether the visual-haptic aptitude is a significant factor in level of reading achievement attained by 7th grade. Data from 325 7th grade males was derived from (a) Ss' raw scores on Gibson's Successive Perception I, a motion picture test designed to assess the ability to integrate successive partial impressions of abstract visual stimuli into an accurate single scheme or pattern; and (b) the reading portion of the Iowa Tests of Basic Skills. Analysis of variance results show that the mean reading achievement for nonvisual Ss is likely to be 1 grade level below that of their visually oriented peers and more than $\frac{1}{2}$ a grade level below that of their indeterminate classmates. The precise nature of the visual-haptic aptitude as it relates to the development of reading skill is not yet determined, however, it is hypothesized that it is, in part, "related to some 'failure' in the early development of perceptual skills."—*M. Maney.*

7055. Field, T. W. & Poole, Millicent E. (U. New England, Faculty of Education, Armidale, New South Wales, Australia) **Intellectual style and achievement of arts and science undergraduates.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 338-341.—Investigated the quality of passes attained by 101 arts and science students who entered the University of New England in 1968. Results indicate that while convergent bias was associated, in both faculties, with more high level passes in the 1st yr., there was no difference in the relative success of convergers and divergers in the 2nd yr. Also it was found that among these students the relationship between choice of faculty and intellectual style was in accord with L. Hudson's suggestions despite the less specialized schooling of Australian students when compared with their English counterparts.—*Journal abstract.*

7056. Finlayson, D. S. (U. Liverpool, School of Education, England) **A follow-up study of school achievement in relation to personality.** *British Journal of Educational Psychology*, 1970(Nov), Vol. 40(3), 344-348.—Examined the relationships between extroversion, neuroticism, and the school achievements of a group of 128 boys at the ages of 12, 13, and 14 in a grammar school using the method of "zone analysis." The Junior Eysenck Personality Inventory was given at the beginning of the 2nd yr. in the school. In the 11+ tests, no systematic differences between the groups were noted, but once in the secondary school, introverts obtained progressively higher marks in yearly examinations than extroverts. In introverts, low neuroticism is consistently associated with better achievement. In extroverts high neuroticism steadily depresses academic performance over the 3 yr. to give a significant overall effect in the 3rd yr. If the achievements of only the 2 high neurotic groups are considered, introverts tend to improve with age while extroverts deteriorate.—*Journal abstract.*

7063. Kositsky, Nate & Franken, R. E. (U. Calgary, Alberta, Canada) **Effects of grading and rewrite procedures on an academic performance.** *Psychological Reports*, 1970(Aug), Vol. 27(1), 244-246.—Instructed 40 undergraduates to complete a critical analysis of a book for their course in psychology. Ss were

divided into 4 different groups. 1 group was told that the grade received on this assignment would count toward the final mark, while another group was told that all reports would receive an "A" grade. A rewrite-no rewrite procedure was introduced for each 1/2 of these groups. Results show an effect of both the grading ($p < .05$) and rewrite ($p < .05$) variables in terms of improved academic performance.—*Journal abstract.*

7064. Kuttner, Robert E. (U. Chicago, Medical School) **Comparative performance of disadvantaged ethnic and racial groups.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 372.—Tested the hypothesis that environmental factors must be identified and equated before genetic influences can be considered in comparative studies of group achievement. In a national survey, American Indian children excelled Negro children on several scholastic tests. Accompanying data ranked Indian students below the Negro in socioeconomic and psychological factors, i.e., ambition, motivation, and self-concept. It is concluded that "evidence of genetic components in group performance can be obtained without ... equating all known and suspected environmental factors."—P. Zell.

7065. Marso, Ronald N. (Bowling Green State U.) **The influence of test difficulty upon study efforts and achievement.** *American Educational Research Journal*, 1969(Nov), Vol. 6(4), 621-632.—Conducted 2 experiments with 155 and 44 undergraduates, respectively, to determine if a relationship exists between classroom unit test difficulty and student learning efforts and outcomes. It was hypothesized that students exposed to less difficult unit tests would achieve greater, and students exposed to less difficult unit tests during a course would spend more time studying during the course. Ss experienced unit exams of near 50%, considered statistically desirable, or near 70% difficulty. Analysis of variance procedures with a measure of mental ability used as a control variable were completed on final examination scores used as the criterion in Exp. I and on the reported daily study time used as the criterion in Exp. II. Results support the hypotheses and the classroom educators' contention that students expend greater effort and achieve more when less difficult unit tests are given during a course.—*Journal abstract.*

7066. National Center for Health Statistics. (U.S. Public Health Service, Health Services & Mental Health Administration, Rockville, Md.) **School achievement of children 6-11 years as measured by the Reading and Arithmetic subtests of the Wide Range Achievement Test, United States.** *Public Health Service Publication*, 1970, No. 1000, Series 11(103), 47 p.—Presents national estimates of school achievement for children in the noninstitutionalized population of the United States. Data were obtained from 7119 (or 96%) of a probability sample of 6-11 yr. olds. Findings are presented by age, race, region, and sex, and permit comparison with data used in Jastak's standardization of his 1963 Revised Wide Range Achievement Test. Present survey results were, on the average, lower than those for the standardization group for both Reading and Arithmetic subtests, especially in Arithmetic. Slightly greater variability was also found in the Reading subtest. An appendix provides details of survey design and reliability of estimates.—P. McMillan.

7067. Oakland, Thomas D. (U. Texas) **Auditory discrimination and socioeconomic status as correlates of reading ability.** *Journal of Learning Disabil-*

ities, 1969(Jun), Vol. 2(6), 325-329.—Studied relationships between reading achievement and socioeconomic status (SES) and performance on phonemic and non-phonemic auditory discrimination tests. Based on rating from the Index of Social Characteristics, 20 1st-6th graders were assigned to each of 3 SES groups: lower-lower (LL), upper-lower (UL), and upper-middle (UM). Ss were 1st administered the Columbia Mental Maturity Scale, the Pictorial Similarities and Differences II subtest of the Revised Stanford-Binet, and the Wepman Auditory Discrimination Test. In a 2nd meeting, 4 nonphonemic auditory discrimination tests of intensity, frequency, and pattern were given. Results show that: (a) UM Ss read significantly better than UL Ss who read significantly better than LL Ss; and (b) reading achievement measures correlated higher with phonemic auditory assessment than with nonphonemic auditory assessment. Bogotá, Colombia) **Descripción de un grupo de alumnos de psicología de la Universidad Nacional.** [A description of a group of psychology students at the National University.] *Revista de Psicología*, 1967, Vol. 12(1-2), 35-39.—The results of a Spanish translation of the American Council on Education Aptitude Test, high school GPA, college admission test results, and college GPAs were used to compare 1180 candidates for admission to the various schools of the National University of Colombia, 55 candidates for admission to the Department of Psychology, and 19 students accepted in the Department of Psychology in 1962 and graduated in 1965. The major finding was that the combined high school GPA and academic aptitude test result score is an excellent student selection criterion. A question that remained unanswered concerned the reasons why some well-qualified students drop out during their college career.—*L. Zusne.*

7077. Hirst, Wilma E. (School Administration Bldg., Cheyenne, Wyo.) **Sex as a predictor variable for success in first grade reading achievement.** *Journal of Learning Disabilities*, 1969(Jun), Vol. 2(6), 316-321.—Studied the relationship of kindergarten measures of IQ, readiness, maturity development, creativity, sociometric relationship, physical skills, social-emotional growth, perceptual development, and family background with academic achievement in a 3-yr study of 14 males and 112 females. Regression equations were computed on each measurement, with achievement at the end of the 1st grade as the dependent variable. Results show that prediction of 1st grade reading success may be made if there is an estimate of (a) an intersensory (auditory-visual) symbolic function, (b) and intrasensory perceptual function, and (c) a visuomotor task that stresses intrasensory imagery. Though comparable skills for the sexes seem to be tapped and in the same order, different measures are necessary to do the tapping.—*Journal abstract.*

7078. Walberg, Herbert J. (U. Wisconsin, Research & Development Center for Cognitive Learning) **Predicting class learning: An approach to the class as a social system.** *American Educational Research Journal*, 1969(Nov), Vol. 6(4), 529-542.—Replicates and extends prior empirical work using the Getzels-Thelen model of the class as a social system. From a national sample, data were collected on the characteristics of 144 classes participating in a curriculum project. With the class mean as the unit of analysis, 3 cognitive and 3 noncognitive adjusted learning criteria were canonically correlated with 5 separate predictor batteries: 15 classroom climate scales, 7 personality scales, 20 biographical characteristics, 4 course-teacher effects, and 3 miscellaneous variables. The climate and biographical batteries were found to be highly significant and equally efficient in predicting the learning criteria. (23 ref.)—*Journal abstract.*

7080. Denhoff, Eric; Hainsworth, Peter K., & Siqueland, Marian L. (Meeting Street School, Children's Rehabilitation Center, Providence, R.I.) **The meas-**

urement of psychoneurological factors contributing to learning efficiency. *Journal of Learning Disabilities*, 1968(Nov), Vol. 1(11), 636-644.—Suggests that some children's inability to process sensory information to produce meaningful and efficient motor response is the basis for scholastic failure in many intellectually normal young school children. This neurological inefficiency as expressed through behavior is termed psychoneurological inefficiency. A system of measurement, the Meeting Street School Screening Test for Learning Disorders, is proposed. Results of an ongoing survey of 1000 5-7 yr. old children with this test are reported, generating a range of objective scores over several areas of psychoneurological functioning as a basis for tables of norms. It is stressed that in assessing inefficiency rather than pathology, a child's scores are given meaning by being compared against those of children of the same age, sex, and socioeconomic background. Implications of this measurement framework and methodology are viewed as providing physicians with a tool to increase their ability to distinguish between pathology and functional inefficiency and thus to play a more meaningful role in the assessment and treatment of school failure.—*M. Maney*.

7085. **Falik, Louis H.** (San Francisco State Coll.) **The**

effects of special perceptual-motor training in kindergarten on reading readiness and on second grade reading performance. *Journal of Learning Disabilities*, 1969(Aug), Vol. 2(8), 395-402.—Tested the efficacy of providing special perceptual-motor training as part of the general kindergarten curriculum. 42 children falling within the lower $\frac{1}{3}$ of their group on the Anton Brenner Developmental Gestalt Test of School Readiness were randomly assigned to an experimental or control group. Groups were compared for readiness for reading at the end of the year and reading achievement at the end of the 2nd grade. Results show no significant differences and suggest that the relevance of providing such special training as part of the general curriculum for nonclinical groups must be seriously questioned. (26 ref.)—*Journal abstract*.

7086. **Gordon, Edmund W. & Jablonsky, Adelaide.** (Teacher's Coll., Columbia U.) **Compensatory education in the equalization of educational opportunity: I.** *Journal of Negro Education*, 1968(Sum), Vol. 37(3), 268-279.—Reviewed the effectiveness of 9 programs of compensatory education. Criteria stressed as important to the development of these programs include (a) attention to group interaction and the teacher-learning process; (b) longer periods of instruction extending beyond the confines of the school; (c) development of respect for the enriched school experience by the children; (d) attention to health and nutritional problems; (e) respect for language differences among the children; (f) provisions for transiency of families; (g) preparation of excellent school personnel; (h) adequate facilities and resources; and (i) emphasis on cultural, economic, and ethnic integration in education.—*S. Appelle*.

7087. **Gordon, Edmund W. & Jablonsky, Adelaide.** (Teacher's Coll., Columbia U.) **Compensatory education in the equalization of educational opportunity: II.** *Journal of Negro Education*, 1968(Sum), Vol. 37(3), 280-290.—Presents a comprehensive model for compensatory education for socially disadvantaged children from early child care, the primary school, the elementary school, and the secondary school. Camping is discussed as a possible approach to "extension of the influence and service of formal instruction." The estimated cost of establishing a nationwide system of quality education for all disadvantaged children is discussed.—*S. Appelle*.

7088. **Mahan, Thomas W.** (U. Hartford, Inst. for Human Development) **The busing of students for equal opportunities.** *Journal of Negro Education*, 1968(Sum), Vol. 37(3), 291-300.—Assesses the effect of "busing" as a means of achieving equal educational opportunity for minority youth in Boston, Hartford, Rochester, and New York. No evidence was found of psychological trauma or alienation from their communities among the participants of busing programs. The introduction of disadvantaged black children into the classroom did not depress academic achievement among white pupils, and black pupils quickly assimilated socially and succeeded in peer group relationships.—*S. Appelle*.

7089. **Mushier, Carole L.** (U. Southern California) **A cross-sectional study of the personality factors of girls and women in competitive lacrosse.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 635-636.

7090. **Pryzwansky, Walter B.** (Columbia U.) **The**

effect of perceptual-motor training and manuscript writing on reading readiness skills in kindergarten. *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 384.

(Boston U., School of Education) **An evaluation of an experimental program designed to affect student attitudes and academic achievement through modifications in the institutional structure of a high school.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 902-903.

7092. Smoll, Frank L. (U. Wisconsin) **Specificity and delay of information feedback as factors in the learning of a motor skill.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 637-638.

7093. Titone, Renzo. **Guidelines for teaching a second language in its own environment.** *Modern Language Journal*, 1969(May), Vol. 53(5), 306-309. —Reviewed the 3 basic points of reference in foreign language instruction: (a) historical antecedents of learning language abroad, (b) the scientific reasons for "cultural-linguistic immersion," (c) "natural setting" language learning guidelines. History has advanced the theory that the best possible way to learn a foreign language is through a combining of experiences and formal training. Psycholinguistics has proposed that language is a system of experience based on verbal symbols, and that it is a complex sociopsychological process. It is suggested that the student experience "systematic interaction" with the foreign environment aided by a working, selective syllabus. The student should be made aware of contrasting and comparing linguistic and cultural patterns. Well planned "life exercises" would be experiences through proper use of textbooks and audiolingual processes. It is concluded that the most vital tool in foreign language learning is the teacher and advises that he be ideally both bilingual and bicultural.—C. O'Donnell.

7094. Tyler, Robert W. (Pennsylvania State U.) **Lateral dominance as a factor in learning selected motor skills.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 638.

7095. Weisman, Seymour; Snadowsky, Alvin, & Alpert, Estelle. (City Coll., City U. New York) **Alumni feedback and curriculum revision.** *Improving College & University Teaching*, 1970, Vol. 18, 120-121. —In evaluating attitudes toward the college curriculum, graduates are too often overlooked. However, alumni are uniquely suited to determine the more stable and long-range effects of an instructional program. A survey of graduates' attitudes toward the curriculum was conducted at a large urban Eastern college. It was found that alumni reported very favorably about courses given in their major department, and much less favorably about the required core sequence. These data served as a basis for curriculum revision, improved curricular guidance, and long-range planning.—Author abstract.

7096. Westbury, Ian. (U. Chicago) **Curriculum evaluation.** *Review of Educational Research*, 1970(Apr), Vol. 40(2), 239-260. —Evaluation is considered in terms of its intentionality and curriculum in terms of systematic curriculum-evaluation. Its methodological aspects are discussed and examples of all of these evaluative curricular variants are given. 2 problems are apparent through the review: the issue of intention and the issue that centers on the conceptualization of the foundations

on which curriculum evaluation must be built. (3 p. ref.)—P. D. Leedy.

Teaching Methods & Teaching Aids

7097. Burse, Luther. (U. Maryland) **An experimental application of subsuming concepts to meaningful verbal learning terminating with the performance of selected psychomotor tasks.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 640.

7099. Enstrom, E. A. (Peterson Handwriting, Greensburg, Pa.) **Left-handedness: A cause for disability in writing.** *Journal of Learning Disabilities*, 1968(Jul), Vol. 1(7), 410-414. —Compares methods of teaching writing to right- and left-handed children. (17 ref.)

7100. Huebner, Robert W. (U. Maryland) **Interactions between patterns of individual differences in sensory modalities of students and methods of classroom instruction.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 679.

7101. Jonas, Ruth A. **The twinned classroom approach to FLES: Resumé of the first two years of a five year sequence.** *Modern Language Journal*, 1969(May), Vol. 53(5), 342-346. —Summarizes the 1st 2 yr. of a 5-yr study in the "twinning" approach to foreign language acquisition. The 2 groups consisted of American and French students matched for grade level, who "met" via slides sent back and forth. A control group of Americans was also selected. This group had the same teacher, the same instructional materials and methods, but did not have access to the slides and tapes. As the study progressed, the experimental group became more intensely involved with the culture and personality of their overseas "twin." Various inventories were administered and the control group showed only slight advantage. It is suggested that no definite conclusion may be reached until the termination of the study. It is suggested that at the beginning of the 3rd yr. there is an observable decline in interest in French in the control group.—C. O'Donnell.

7102. Jones, J. Kenneth. (U. London, Inst. of Education, England) **Comparing i.t.a. with colour story reading.** *Educational Research*, 1968(Jun), Vol. 10(3), 226-234. —Compares the results of a previous 2-yr investigation of Color Story Reading (CSR) in about 400 beginning reading children, with a similar previous investigation of the Initial Teaching Alphabet (ITA). In both experiments Ss were split into control and experimental groups matched for school, age, sex, social class, and intelligence. Comparison on the basis of terminal performance on the Schonell Graded Word Reading Test and Schonell Graded Word Spelling Test "A" revealed that (a) control groups in the 2 experiments did not differ in scores; (b) the experimental top 3rd in the CSR investigation were 22 mo. ahead of their controls in reading, compared with 3 mo. for the ITA top 3rd; (c) the CSR experimental top 3rd was 17 mo. ahead of their controls in spelling, as compared to 3 mo. behind for the ITA experimental top 3rd. High scores by the CSR experimental group were suggested to be attrib-

utable to the ease of learning to read by the CSR method and the efficiency of transfer of learning to traditional orthography. (21 ref.)—R. Wiltz.

7103. Loveless, Edna M. (U. Maryland) **Developing critical thinking skills in students in eighth grade English classes.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 681.

7104. Wheeler, Robert W. (U. Michigan) **Self-transcendence as a normative philosophy and psychology underlying the teaching of literature and composition.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 689.

PERSONNEL & INDUSTRIAL PSYCHOLOGY

7105. ———. **Human Resources Research Organization: Bibliography of publications as of 30 June 1969.** Alexandria, Va.: Human Resources Research Organization, 1969. vii, 312 p.

7106. Campbell, R. J., et al. **On becoming a psychologist in industry: A symposium.** *Personnel Psychology*, 1970(Sum), Vol. 23(2), 191-221.—After an introduction by Campbell covering the objectives of a symposium presented at the 1968 APA meeting, James Naylor describes the professional-scientific dichotomy and the related training strategies. Paul Thayer reports on the responses of a small group of recent graduates and their conflicts between research interests and job demands. Training in research should develop the ability to think critically about research design and objectives. Wayne Sorenson reports on his own experiences as a beginning industrial psychologist and emphasizes the need to gain acceptance as a valuable resource person in the organization and to be aware of the misperceptions which laymen have of psychologists and which psychologists have of businessmen. Using the University of Rochester Program as an example, Bernard Bass describes a 2-track program in industrial and organizational psychology which provides concentration and interaction among psychologists and management. A symposium discussant, Douglass Bray, stresses the need to be both professional and scientific and urges that this need be considered in career planning. The characteristics of an effective practitioner include realistic expectations of the setting, grasp of the major problems of the organization, ability to identify the crucial determinants of the problem, professional sophistication and awareness of his own competencies, willingness to function at all levels of competence, ability to propose research and action adequate to the problem, and persuasive communication skills.—A. S. Thompson.

7107. Daniel, Jozef. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Achievement in the Stroop Interference test in relation to profession.** *Studia Psychologica*, 1970, Vol. 12(2), 99-102.—A comparison of scores in Stroop's subtests achieved by a group of 53 skilled workmen and those of leading executives failed to bring out significant differences. A dominance of conceptual activity was found in the executives while psychomotor activity predominated in the workmen. A significant correlation was observed between workers' subtests and intelligence, and between scores in the attention distribution test and

performance in Bourdon's test. In former studies by J. Daniel certain correlates of the Stroop interference test were reported. Achievement in this test was related to results in some further tests, to personality inventory, and to a rating by chief executives. The statement by A. R. Jensen and W. D. Rohwer that this test is suitable in the diagnosis of cognitive abilities was confirmed, with those factors proving the most suitable for the scores which embodied a color-naming component. (Czech & Russian summaries)—*Journal abstract*.

7108. de Abisambra, Gladys. (National U., Bogotá, Colombia) **Selección y orientación profesional en Colombia.** [Personnel selection and vocational counseling in Colombia.] *Revista de Psicología*, 1967, Vol. 12(1-2), 17-33.—Describes the personnel, tests, and procedures used by various educational institutions and private enterprises in Colombia to select and counsel personnel and students.—L. Zusne.

7109. Graulich, Pascal. (National U., Bogotá, Colombia) **La psicología industrial y los problemas del desarrollo económico.** [Industrial psychology and the problems of economic development] *Revista de Psicología*, 1967, Vol. 12(1-2), 13-15.—Economic development brings about problems that are primarily technological in nature. Solutions for these problems, although also technological in nature, are accompanied by a large number of social and psychological problems. The extent to which an industrial psychologist may contribute to the solution of problems brought about by change in industrial settings is outlined.—L. Zusne.

7110. Ronan, W. W., Tatro, C. R., Aral, S., & Latham, G. P. (Georgia Inst. of Technology) **Psychological, sociological, and demographic variables affecting the pulpwood harvesting labor force in a Southeastern United States community.** Atlanta, Ga.: American Pulpwood Assn., Harvesting Research Project, 1970. viii, 85 p.—Results indicate that population movement to urban centers was not affecting the ability of the pulpwood industry to attract labor in this community, but that attitudes held by community leaders, high school students, and the general public were not favorable regarding the pulpwood producer's job, his physical working conditions, the actual tasks he performs, his pay and benefits, and the type of people with whom he works. Job satisfaction questions posed to the general public were poorly received and yielded inconclusive results. Certain technical requirements of questionnaires for the studied population were determined.—*Author abstract*.

7111. Velehradský, Antonín. (Inst. of Education for Executive Staff of Chemical Industry, Prague, Czechoslovakia) **Psychologické problémy stárnutí a jejich důsledky pro personální řízení.** [Psychological aspects of aging and personnel work.] *Psychologie v Ekonomické Praxi*, 1968, No. 3-4, 136-148.—Examines the rapid technological development and more exacting qualification demands made on aging workers. The biological and psychological changes of older employees are augmented by the discrepancy between their qualification and the production requirements. The phenomenon of aging and its relation to working ability and performance is analyzed. Practical measures for the solution of this problem are presented, especially regarding the placing and retraining of older workers. (French, Russian, & German summaries)—*English summary*.

7112. Weber, Arnold R., Cassell, Frank H., & Ginsburg, Woodrow L. (Eds.) (U.S. Dept. of Labor, Washington, D.C.) **Public-private manpower policies.** Madison, Wis.: Industrial Relations Research Association, 1969. iii, 210 p.

VOCATIONAL CHOICE & GUIDANCE

7113. Sánchez de Barrientos, Lilia; Ramírez A., Hernando, & Jaramillo S., Luis J. (National U., Bogotá, Colombia) **Estudio de la batería general de pruebas de aptitudes GATB en formación profesional de adolescentes.** [A study of the General Aptitude Test Battery GATB in the vocational development of adolescents.] *Revista de Psicología*, 1967, Vol. 12(1-2), 55-68.—A modified Spanish version of the GATB was given to several hundred 5th grade students in Colombia. At this age level training in a national vocational training program may begin. While most test-retest reliabilities obtained at 8, 57, and 275 days were significant at the .01 level, they were generally low and varied inconsistently from 1 test administration to another. Validity was established by correlating GATB scores and scores obtained by students in the 1st 6 mo. of vocational training courses. In both industrial and business courses multiple *r*'s were significant at the .01 level, except in mechanical maintenance, machine-tool, and accounting courses, where they were significant at the .05 level. Recommendations are presented for improving the test battery.—L. Zusne.

SELECTION & PLACEMENT

7114. Carlson, Robert E., Schwab, Donald P., & Heneman, Herbert G. (Life Insurance Agency Management Assn., Hartford, Conn.) **Agreement among styles of selection interviewing.** *Journal of Industrial Psychology*, 1970(Mar), Vol. 5(1), 8-17.—Assessed the extent of agreement among job interviewers using structured, semistructured, and unstructured interviewing styles. In the structured style group, interviewers obtained from applicants only the information specified on an application blank. 18 male assistant city department managers served as interviewers. In the semistructured group, interviewers asked only additional questions they felt were pertinent. Members of the unstructured group interviewed applicants as they saw fit. Only interviewers performing under structured conditions agreed with each other to any appreciable extent. It is concluded that "the 3 styles are probably not measuring the same characteristics of the interviewees," and that "only with a structured interview procedure is there a potential for validity."—S. Appelle.

7115. Krau, E. (Academy of Romanian Socialist Republic, Psychology Div., Cluj, Romania) **Experimental research in vocational adjustment and personnel selection.** *Studia Psychologica*, 1970, Vol. 12(2), 125-133.—Discusses occupational maladjustment caused by lack of aptitude, interest, and a negativistic attitude toward job requirements. Personnel classification (selection) can help to cope with this problem. Psychological job descriptions for mining and turning are presented. To have the greatest efficiency, selection must take place at trade school entrance and include data on life background. Such data help to predict success in trade instruction and stability on the job. Promotional potential can also be predicted by tests.

Research with 126 miners is described. (Czech & Russian summaries)—*Journal abstract.*

7116. Rulon, Philip J., Tiedeman, David V., Tatsuoka, Maurice M., & Langmuir, Charles R. (Harvard U., Graduate School of Education) **Multivariate statistics for personnel classification.** New York, N.Y.: John Wiley, 1967. xi, 406 p. \$12.95.

7117. Thumin, Fred J. (U. Missouri, St. Louis) **Comparative study of three mental ability tests.** *Journal of Industrial Psychology*, 1970(Mar), Vol. 5(1), 1-7.—Introduces a new mental ability test, the Mental Dexterity Test (MDT), designed to be used either as a speed or power test and "of sufficient difficulty to discriminate between relatively bright individuals, such as those typically sought to fill managerial positions of considerable responsibility..." To ascertain the internal consistency and level of difficulty for this test, comparisons were made between the MDT, Otis Self-Administering Test, and the Wonderlic Personnel Test (WPT). Results suggest "that the MDT is a test of satisfactory reliability, [and] 1 which provides considerably more ceiling than either the widely used Otis or WPT..."—S. Appelle.

TRAINING

7118. Sherrow, Jeanne E. (U. Illinois) **The effect of a creative problem solving workshop on selected municipal recreation personnel.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 651-652.

7119. Walton, Howard N. & Schubert, Delwyn G. (Los Angeles Coll. of Optometry, Calif.) **Vision-perception testing and training program: Clerical operations.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1969(Nov), Vol. 46(11), 840-847.—A vision and perception testing and training program for 25 post office employees (mean age, 29 yr.) shows that the span of recognition for words and digits may be significantly increased. Also, speed and accuracy in grouping and matching digits may be significantly increased. Ss with the lower starting levels in span of recognition have a tendency to show greater gains indicating high level starting perceptual skills are not necessarily a prerequisite for achievement. Programs may be specifically designed for clerical and industrial situations.—*Journal abstract.*

TASK & WORK ANALYSIS

7120. McCormick, Ernest J., Jeanneret, Paul R., & Mechem, Robert C. (Purdue U., Research Foundation) **The development and background of the Position Analysis Questionnaire (PAQ).** *Occupational Research Center Report*, Purdue U., 1969(Jun), No. 5, 25 p.—Describes the development of the Position Analysis Questionnaire (PAQ), Form A, from earlier job analysis instruments, and the more recent development of a modified version of the PAQ, Form B. Form A includes 189 job elements characterizing work activities of a behavioral nature and various aspects of the context within which human work is performed. The job elements of the PAQ have been used (a) as the basis for deriving various sets of job dimensions, (b) for exploratory studies dealing with the potential use of the PAQ as the basis for developing synthetically-derived job attribute requirements, and (c) for job evaluation purposes. Form B is essentially a refinement of Form A,

with some moderate changes, and includes 194 items. Copies of both forms are included.—*Journal abstract.*

7121. Stríženec, Michal. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Attempts to work out a more realistic model of an operator's thinking activity.** *Studia Psychologica*, 1970, Vol. 12(2), 164-165.

7122. Stríženec, Michal. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Prediction of parameter changes in a simulated control system: I.** *Studia Psychologica*, 1970, Vol. 12(3), 214-226.—Discusses recent research into the operator's activity in industrial production at various levels of automation. Recent investigations are described of an operator's thinking which has formed the basis for a model to study prediction of parameter changes of the regulation process (involving a determination of an unknown arithmetic progression). Results are presented of psychodiagnostic tests with 22 undergraduates and 38 apprentices on a model panel. (Czech & Russian summaries)—*Journal abstract.*

PERFORMANCE & JOB SATISFACTION

7129. Ilgen, Daniel R. (U. Illinois) **Satisfaction with performance as a function of the initial level of expected performance and the deviation from expectation.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 942-943.

7130. Karson, Samuel & O'Dell, Jerry W. (Eastern Michigan U.) **Performance ratings and personality factors in radar controllers.** *FAA Office of Aviation Medicine Report*, 1970(Sep), No. 70-14, 4 p.—Computed a correlation matrix on 19 variables (primary factors in the 16 PF, a motivational distortion score, and 2 parts of an official FAA employee appraisal record) for 264 radar controllers. Criterion variables (performance appraisals) were not related to the personality measures.—*W. E. Collins.*

7131. Klein, Stuart M. & Ritti, R. R. (U. Kentucky) **Work pressure, supervisory behavior and employee attitudes: A factor analysis.** *Personnel Psychology*, 1970(Sum), Vol. 23(2), 153-167.—A factor analysis of 55 items in an employee attitude questionnaire administered to 1500 production workers yielded 7 factors. The intercorrelations among the factors are interpreted in terms of work pressures and managerial power. (19 ref.)—*A. S. Thompson.*

7132. Latham, G. P. **An analysis of critical behaviors of pulpwood producers reported by foresters and dealers.** Atlanta, Ga.: American Pulpwood Assn., Harvesting Research Project, 1970. v, 26 p.—A job analysis of the independent pulpwood producer was conducted by means of the critical incident technique for the purpose of developing performance criteria. Critical incidents collected from company foresters were compared with those obtained from pulpwood dealers. Results indicate that there were both qualitative and quantitative differences in the critical behaviors reported by the 2 populations. A questionnaire designed to measure the relevance of the critical behaviors to the producer's job success was analyzed by means of a 2-way multivariate analysis of variance. Results indicate that there were no significant differences in the relevance of the criteria in 10 Southern states, but that there was a significant interaction between occupation and criteria. Foresters considered 2 criteria to be significantly more relevant than did pulpwood dealers.—*Author abstract.*

7133. Owens, A. G. (1st Psychology Research Unit, Albert Park, Victoria, Australia) **Job satisfaction and re-engagement among Australian Regular Army soldiers.** *Australian Journal of Psychology*, 1969(Aug), Vol. 21(2), 137-144.—296 Australian Regular Army soldiers, whose current term of service was due to expire within 2 mo. completed a questionnaire shown to measure overall satisfaction with Army life. Results were analyzed in relation to assessed reengagement intention. It was found that although there was a positive relationship of satisfaction to reengagement intention, the proportion of dissatisfied Ss intending discharge was greater than the proportion of satisfied Ss intending reengagement. A replication, 9 mo. later, with 418 Ss, produced similar results, although some shrinkage occurred in the relationships of satisfaction to actual subsequent reengagement. An explanation of the findings is offered in terms of the attractiveness of alternative employment.—*Journal abstract.*

7134. Payne, Roy. (London Graduate School of Business Studies, England) **Factor analysis of a Maslow-type Need Satisfaction Questionnaire.** *Personnel Psychology*, 1970(Sum), Vol. 23(2), 251-268.—A factor analysis of scores on the Need Satisfaction Questionnaire administered to a group of female operators as an unskilled job yielded only 2 general factors—general need satisfaction and general job valence. A similar study using management students

yielded similar results. The lack of specific factors cast doubt on the usefulness of the Need Satisfaction Questionnaire in measuring the needs in the Maslow hierarchy. (32 ref.)—A. S. Thompson.

7135. Prien, Erich P. (Memphis State U.) **Measuring performance criteria of bank tellers.** *Journal of Industrial Psychology*, 1970(Mar), Vol. 5(1), 29-36.—Compares objective and subjective criteria of job performance of 45 bank tellers, and provides "patterns of validity coefficients for individual test/criterion combinations." Judgments of effectiveness are primarily related to ability measures. The only significant personal characteristics are revealed in the Gordon Personal Profile Scales of Responsibility and Emotional Stability.—S. Appelle.

7136. Roach, Darrell E. & Wherry, Robert J. **Performance dimensions of multi-line insurance agents.** *Personnel Psychology*, 1970(Sum), Vol. 23(2), 239-250.—36 variables relating to the performance of multiline insurance agents were subjected to a modified centroid factor analysis followed by hierarchical rotation. 13 factors emerged, including 7 tertiary level factors. The general, 2 secondary and 5 tertiary level factors described degrees of specialization ranging from the all around salesman, who is a high producer in all lines, to those who excel only in 1 product line. A 3rd secondary level factor and its 2 tertiary level factors describe agents with long service and with income from renewal commissions. The remaining secondary level factors describe agents who emphasize repeat sales and those who write marginal insurance risk customers.—A. S. Thompson.

7137. Šipos, Ivan & Kollárik, Tibor. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Effect of long-term stress on employment stability.** *Studia Psychologica*, 1970, Vol. 12(2), 162-164.

7138. Soliman, Hanafi M. (U. Illinois) **The motivation-hygiene theory of job attitudes: An empirical investigation, and an attempt to reconcile both the one and the two-factor theories of job attitudes.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 943.

7139. Sukhareva, A. I. (Inst. of General & Educational Psychology, Moscow, USSR) **O psikhologicheskikh proyavleniyakh osnovnykh svoystv nervnoy sistemy v trudovoy deyatelnosti.** [Psychological manifestations of the basic properties of the nervous system in work activity.] *Voprosy Psikhologii*, 1970(Jul), Vol. 16(4), 35-46.—9 16- and 17-yr-old technical school students were studied over a 2-yr period in order to relate typological and work productivity characteristics. Time studies of drilling and turning operations were made twice each year. The straight-line equation was used to approximate the work curve. Alpha-blocking time and RT curves to light in dark-adapted Ss were used as indices of the strength of the nervous system and were correlated with work curve data. Results showed that work curves reflect individual typological differences. For instance, at the beginning of the training period "weak" Ss were inferior to "strong" Ss in terms of work efficiency (Coefficient a) but better in terms of rate of efficiency gain (Coefficient b). At the end of the training period "weak" Ss were superior on both indices. (English summary)—L. Zusne.

7140. Wollack, Stephen. (Bowling Green State U.)

The effects of work rate upon job satisfaction. *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 944.

7141. Wood, Donald A. & LeBold, William K. (Indiana U.) **The multivariate nature of professional job satisfaction.** *Personnel Psychology*, 1970(Sum), Vol. 23(2), 173-189.—An overall job satisfaction index and 34 questionnaire items were evaluated by a national sample of over 3000 engineering graduates. Factor analysis suggested that job satisfaction is multidimensional. A general job characteristic factor and a specific factor, professional challenge, were most related to overall job satisfaction. The curvilinear nature of job values is examined, and alternative techniques of multivariate analysis are suggested. (22 ref.)—A. S. Thompson.

MANAGEMENT & ORGANIZATION

7142. Davies, Evan; Wyndham, John, & Binks, Noel. (U. New South Wales, Sydney, Australia) **Psychological changes in sensitivity training.** *Australian Psychologist*, 1969(Mar), Vol. 3(3), 171-176.—Studied the effects of sensitivity training on some aspects of motivation, attitudes to managerial style, and changes in group dynamics in 46 senior managers. Changes were noted in the motivational strength of social assertiveness, in the degree of conflict associated with career motivation, in managerial attitudes to authoritarianism, and democratic cooperative styles. Group variations in intimacy and participation also manifested themselves.—*Journal abstract.*

7143. Finkle, Robert B. & Jones, William S. **Assessing corporate talent: A key to managerial manpower planning.** New York, N.Y.: Wiley-Interscience, 1970. ix, 248 p. \$9.95.

7144. Fleishman, Edwin A. & Simmons, J. (American Inst. for Research, Washington, D.C.) **Relationship between leadership patterns and effectiveness ratings among Israeli foremen.** *Personnel Psychology*, 1970(Sum), Vol. 23(2), 169-172.—A Hebrew version of the Supervisory Behavior Description was administered to 318 Israeli foremen. The results relating to ratings of foremen performance confirmed the general desirability of both high consideration and high structure.—A. S. Thompson.

7145. Flory, Charles D. (Ed.) (Rohrer, Hibler, & Replogle, New York, N.Y.) **Managing through insight.** New York, N.Y.: World Publishing, 1968. xviii, 261 p. \$5.95.

7146. Greene, Charles N. (Ohio State U.) **The development of role consensus and its effect on evaluation of performance and satisfaction within the managerial dyad.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 514.

7147. Kingdon, Donald R. (U. California, Los Angeles) **The management of complexity in a matrix organization: A socio-technical approach to changing organizational behavior.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 517-518.

7148. Ronan, W. W. (Georgia Inst. of Technology) **Evaluation of three criteria of management performance.** *Journal of Industrial Psychology*, 1970(Mar), Vol. 5(1), 18-28.—Evaluates the effectiveness of several criteria of management performance in terms of their predictability and intercorrelations. Management personnel (N = 100) were rated twice a year with forms

—i.e., the 11-item Corporate Ratings form, and a 23-item descriptive phrase, forced choice form—in a formal, continuing program of management evaluation. It is concluded “that criteria presumably measuring the same performances and performers show quite low intercorrelations,” and “attempts to predict performance of management personnel are likely to have limited success if the group is heterogeneous as to age and education.” (18 ref.)—S. Appelle.

7149. Taylor, James C. (U. Michigan) **The conditioning effects of technology on organizational behavior in planned social change.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-B), 943-944.

SPECIAL ENVIRONMENTS

7150. Bucove, Arnold D. & Maioriello, Richard P. **Symptoms without illness: Fear of flying among fighter pilots.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 125-142.—Presents the case histories of 6 out of 7 fliers who were afraid to fly their aircraft and had somatic complaints. Somatic complaints were acceptable in the fighter pilot milieu, but fear of flying and psychiatric complaints were not acceptable in the pilot milieu. Somatic complaints were not accepted by the pilots' physicians but a fear of flying was. In the course of therapy the pilots changed from somatic symptoms to a recognition of their underlying fear of flying. The symptoms had been communications that the pilots did not want to fly jet fighters anymore. (15 ref.)—*Journal summary*.

7151. Capel, W. C., Youngblood, David, & Stewart, G. T. (Tulane U., School of Public Health & Tropical Medicine) **Note on stress, anxiety and related defenses in a controlled situation.** *Psychological Reports*, 1970(Oct), Vol. 27(2), 351-355.—Placed 4 highly trained, experienced aquanauts in a situation with hazardous but familiar dangers. Although accustomed to psychological tests, they had never been tested with the Institute for Personality and Ability Testing 8-Parallel Form Anxiety Battery which was given 15 min. prior to the beginning of the dive. Another form of the test with a high correlation value was given 30 min. after the 48-hr dive. Anxiety levels prior to the experiment were abnormally low as compared to the general population, indicating the presence of a defense mechanism controlling anxiety. After the dive, anxiety levels returned or began to return to, points approximating those of the general population.—*Journal abstract*.

7152. Cram, John M. (U. British Columbia, Vancouver, Canada) **Perceived need satisfactions of workers in isolated environments.** *Dissertation Abstracts International*, 1970(Jul), Vol. 31(1-B), 430-431.

7153. Hasbrook, A. Howard & Rasmussen, Paul G. (FAA, Civil Aeromedical Inst., Physiology Lab., Oklahoma City, Okla.) **Pilot heart rate during in-flight simulated instrument approaches in a general aviation aircraft.** *FAA Office of Aviation Medicine Report*, 1970(Apr), No. 70-7, 10 p.—Studied stress responses in 8 highly experienced pilots during simulated in-flight instrument approaches in a single-engine aircraft. Heart rate increased significantly from pre-approach base lines during each of 10 approaches per pilot, although the overall mean heart rate decreased across successive approaches.—W. E. Collins.

ADVERTISING & CONSUMER PSYCHOLOGY

7154. Dascher, Paul E. (Pennsylvania State U.) **The behavioral impact and implications of varying approaches to market segment reporting: An empirical study.** *Dissertation Abstracts International*, 1970(Aug), Vol. 31(2-A), 507.

ENGINEERING PSYCHOLOGY

Displays & Controls

7155. Easterby, R. S. (U. Aston, Birmingham, England) **The perception of symbols for machine displays.** *Ergonomics*, 1970(Jan), Vol. 13(1), 149-158.—Discusses the role of pattern perception theory based on the Gestalt view of perception in relation to the practical design of symbols for machine displays. Experimental studies of discrimination and apprehension of meaning of symbols are reviewed, and perceptual principles important to symbol design are summarized. (20 ref.)—*Journal abstract*.

DRIVING & SAFETY

7156. Harano, Richard M. (Dept. of Motor Vehicles, Sacramento, Calif.) **Relationship of field dependence and motor-vehicle-accident involvement.** *Perceptual & Motor Skills*, 1970(Aug), Vol. 31(1), 272-274.—Administered 8 cards from Witkins Embedded-Figures Test to a group of 28 accident and 27 accident-free drivers to evaluate the relationship between field dependence and motor-vehicle-accident involvement. Multiple regression results indicate that field dependence was significantly related to accident involvement. Results suggest that measures of perceptual style such as field dependence may hold promise for future research in traffic safety.

7157. Nicholl, Armand M. (Harvard Medical School, Boston, Mass.) **The motorcycle syndrome.** *American Journal of Psychiatry*, 1970(May), Vol. 126(11), 1588-1595.—Presents findings of an indepth study of 9 accident-prone motorcyclists which outline this previous undescribed syndrome. An attempt is made to explain the psychological causes of the rapidly rising rate of motorcycle accidents and deaths. The characteristics of the motorcycle syndrome as derived from the study of the 9 motorcyclists (all of whom were college students and had had more than 1 serious motorcycle accident) are as follows: (a) unusual preoccupation with motorcycle (dreams, fantasies, and free association with various aspects of cycling); (b) a history of accident-proneness extending to childhood years; (c) persistent fear of bodily injury (expressly fear of castration); (d) conflict-ridden relationship with father and strong identification with mother (father viewed as formidable competitor); (e) extreme passivity and inability to compete; (f) defective self-image; (g) poor impulse control; (h) fear of and counterphobic involvement with aggressive girls; and (i) concern with impotence and intense fear of homosexuality. Treatment involved 2-3 sessions/wk for 6 mo.-3 yr. bringing about the gradual decathexis of the motorcycle. All 9 of the patients were successfully treated. (31 ref.)—P. R. Shibelski.

Brief Subject Index

This index supplements the classification of abstracts given in the Table of Contents, and is designed to lead the reader to subjects that are more specific than the general categories of the classification. When many abstract numbers are listed under a heading, the reader may simplify his task by matching the numbers found under the two or more headings that specify his particular interest.

- Ability (see also Childhood/Ability in)
5438, 5554, 5854, 6341, 6630, 6954, 7115
- Ability/Verbal (SEE Ability, Verbal Behavior)
- Abnormal Behavior (SEE Behavior Disorder, Mental Disorder, Neurosis, Psychosis, specific abnormalities)
- Abnormal Psychology (SEE Clinical Psychology, Psychopathology)
- Abortion

- Blindness** (see also Vision/Defective)
6443, 6810, 6811, 6813, 6814, 6816, 6818, 6819, 6820, 6982, 6994, 6996
- Blood** (see also Cardiovascular Processes, Heart)
5790, 5859, 6546, 6555, 6609, 6642, 6699, 6852
- Blood-Animal**
5600, 5603, 5649, 5773
- Blood Pressure**
5417, 5827, 5837, 5842, 5844, 6023
- Body** (see also Hand, Physique)
5317, 5333, 5334, 5357, 5583, 5584, 5696, 5857, 5910, 6010, 6449, 6629, 6708, 6895
- Body Image** (SEE Self-Perception, Social Perception, Body)
- Bone Conduction** (SEE Audition)
- Books**
5183, 5190, 5194, 5236, 5239, 5253, 5269, 5390, 5430, 5495, 5551, 5552, 5576, 5872, 5875, 5878, 5978, 5980, 5981, 5982, 5984, 6008, 6104, 6106, 6108, 6116, 6119, 6151, 6194, 6246, 6247, 6275, 6276, 6368, 6386, 6388, 6393, 6398, 6406, 6458, 6573, 6603, 6680, 6781, 6800, 6803, 6804, 6831, 6833, 6870, 6913, 6917, 6943, 6961, 6999, 7048, 7105, 7112, 7116, 7143, 7145
- Boredom** (SEE Attitude, Emotion)
- Brain** (see also next headings, Cerebral Cortex, Hypothalamus, Hippocampus, Nervous System/Central, Neuroanatomy, Thalamus)
5194, 5350, 5495, 5707, 6388, 6879
- Brain-Animal**
5495, 5605, 5616, 5638, 5685, 5691, 5700, 5701, 5702, 5711, 5720, 5772, 5775, 5779, 5782, 5795, 5799, 5800, 5815, 5820, 5831
- Brain Damage**
6407, 6409, 6412, 6386, 6835, 6841, 6861, 6862, 6863, 6864, 6865, 6866, 6867, 6868.

BRIEF SUBJECT INDEX

6869, 6870, 6871
Brain Disorder
 6268, 6530, 6586, 6772, 6840, 6844, 6846, 6849, 6851, 6854, 6855, 6934, 7012
Brain Injury (SEE Brain Damage)
Brain Lesion (see also Brain Lesion-Animal, 6764)
Brain Lesion-Animal (see also Rat/Lesions in, Cat/Lesions in)
 5578, 5592, 5626, 5632, 5637, 5640, 5643, 5649, 5650, 5651, 5652
Brain Stimulation (see also Rat/Brain Stimulation in)
 5296, 5624, 5653, 5654, 5655, 5656, 5657, 5658, 5659, 5660, 5662, 5665, 5667, 5668, 5669, 5670, 5674, 5679, 5680, 5682, 5687, 5688, 5751, 5805
Breeding (SEE Genetics)
Brightness (see also Light)
 5332, 5339, 5356, 5357, 5386, 5442, 5446, 5884, 5905, 5933
Britain (SEE Great Britain)
Broken Home (SEE Family, Marital Problems)
Business
 6249, 7110, 7154

California Psychological Inventory (SEE Test/Personality)
Canada
 6435
Cancer (SEE Disease)
Capital Punishment (SEE Law, Crime & Criminals)
Cardiovascular Disorders
 5840, 6405, 6542, 6702, 6761, 6772, 6841, 6911, 6934
Cardiovascular Processes (see also Blood, Blood-Animal, Blood Pressure, Heart, Heart Rate)
 5337, 5605, 5655, 5740, 5821, 5840, 5842, 5843, 5844, 5845, 6016, 6023
Career (SEE Occupation)
Career Choice (SEE Occupational Choice)
Case Report
 6461, 6594, 6607, 6659, 6701, 6760, 6761, 6764, 6765, 6767, 6769, 6772, 6857, 6873, 6874, 6883, 6905, 6912, 6982
Case Report-Treatment
 6443, 6458, 6497, 6502, 6517, 6653, 6683, 6762, 6763, 6766, 6768, 6770, 6771, 6805, 6850, 6878, 6993, 7011
Casework (SEE Social Casework)
Castration (SEE Personality, Sex, Sexual Behavior)
Cat
 5602, 5654, 5656, 5659, 5674, 5679, 5682, 5688, 5691, 5712, 5715, 5737, 5762, 5764, 5771, 5876, 5901, 5973, 5974
Cat/Drug Effects in
 5655, 5658, 5665, 5674, 5803, 5807, 5808, 5813, 5821, 5824, 5834
Cat/Learning in
 5695, 5901
Cat/Lesions in
 5625, 5627, 5665, 5667
Catalepsy (SEE Mental Disorder, Neurosis, Psychosis)
Categorical Behavior
 5378, 5412, 5472, 5479, 5502, 5513, 5543, 5544, 5547, 5557, 5564, 6252, 6303
Catharsis (SEE Therapeutic Process)
Cathexis (SEE Affect, Psychoanalytic Theory)
Catholicism (SEE Religion)
Census Studies (SEE Population Characteristics)
Central Nervous System (SEE Nervous System/Central)
Cerebral Cortex (see also Visual Cortex)
 5599, 5600, 5615, 5616, 5624, 5628, 5630, 5633, 5639, 5642, 5645, 5646, 5654, 5656, 5659, 5665, 5667, 5669, 5670, 5674, 5685, 5695, 5698, 5703, 5726, 5727, 5730, 5744, 5749, 5750, 5751, 5752, 5759, 5762, 5765, 5803, 5807, 5811, 5821, 5909, 6866, 7015

Cerebral Dominance (SEE Cerebral Cortex, Laterality)
Cerebral Palsy (SEE Physical Handicap, Nervous System/Disorder of)
Cerebral Thrombosis (SEE Brain Disorder, Cardiovascular Disorders)
Cerebrovascular Disorder (SEE Brain Disorder, Cardiovascular Disorders)
Certainty (see also Probability)
 5272, 5553, 5579, 6688
Character (SEE Personality, Ethics)
Character Disorder (see also Emotional Disturbance)
 6490, 6853
Cheating (SEE Deception)
Check List (SEE Inventory)
Chicken
 5580, 5650, 5884, 5889, 5893, 5965
Child Abuse
Child Guidance (SEE Psychotherapy/Children, Guidance/Educational)
Child Psychiatry (see also Psychotherapy/Children, Schizophrenia/Childhood, Childhood/Psychosis in)
 5980, 6390, 6391, 6413, 6421, 6450, 6601, 6915
Child Rearing (see also Parent-Child Relations)
 5980, 6094, 6096, 6149, 6602, 7081
Childhood & Children (see also next headings, Gifted, Student/Elementary School, Language Development, Mental Retardation)
 5399, 5532, 5879, 6010, 6012, 6015, 6016, 6017, 6023, 6024, 6081, 6136, 6338, 6406, 6871, 6889
Childhood/Ability in
 5977, 5985, 5996, 6004, 6006, 6007, 6008, 6049, 6059, 6062, 6063, 6064, 6065, 6066, 6067, 6068, 6069, 6939, 7015, 7025, 7054
Childhood/Behavior Problems in
 5984, 6415, 6482, 6500, 6601, 6602, 6603, 6680, 6770, 6840, 6952, 6979, 7031, 7073
Childhood/Concepts & Problem Solving in
 5977, 6040, 6041, 6043, 6044, 6045, 6046, 6047, 6049, 6051, 6052, 6053, 6054, 6055, 6056, 6057, 6058, 6059, 6060, 6061, 6065, 6082, 6811, 7057, 7060
Childhood/Development in (see also Age Differences-Children)
 5276, 5433, 5978, 5980, 5981, 5984, 5990, 5991, 6000, 6003, 6008, 6009, 6011, 6013, 6014, 6018, 6020, 6021, 6023, 6040, 6041, 6042, 6043, 6045, 6051, 6052, 6055, 6070, 6082, 6093, 6873, 6876, 6985, 7077
Childhood/Disadvantaged (see also Socioeconomic Status)
 5870, 6005, 6019, 6050, 6068, 6072, 6079, 6083, 6084, 6415, 6882, 6885, 6971, 6973, 6984, 7003, 7026, 7041, 7048, 7064, 7069, 7086, 7087
Childhood/Emotional Disturbances in
 5988, 6407, 6413, 6500, 6525, 6588, 6590, 6601, 6655, 6680, 6682, 6687, 6865, 6952, 7003, 7017, 7026, 7035
Childhood/Family Relations in (SEE Parent-Child Relations, Family Relations)
Childhood/Gifted (SEE Gifted)
Childhood/Handicapped
 6808, 6811, 6813, 6815, 6818, 6825, 6829, 6977, 6982, 6995
Childhood/Hyperactivity in (SEE Childhood/Behavior Problems in)
Childhood/Learning in (see also Achievement/Academic-Elementary School, Student/Elementary School, School Learning)
 5980, 5983, 5984, 5987, 6003, 6004, 6008, 6011, 6025, 6026, 6027, 6028, 6029, 6030, 6031, 6033, 6034, 6035, 6036, 6037, 6038, 6039, 6050, 6058, 6072, 6085, 6766, 6840, 6854, 6855, 6864, 6896, 6899, 6990, 6991, 7000, 7003, 7005, 7007, 7010, 7013, 7015, 7031, 7045, 7060, 7098, 7099
Childhood/Mental Retardation in (SEE Mental Retardation)
Childhood/Perception in
 5979, 5981, 5986, 5991, 6004, 6005, 6006, 6008, 6048, 6066, 6071, 6073, 6074, 6075,

6076, 6262, 6394, 6854, 6855, 6980, 6985, 7073, 7077, 7085, 7100
Childhood/Personality in
 5980, 6006, 6008, 6026, 6077, 6078, 6079, 6080, 6081, 6082, 6083, 6084, 6093, 6118, 6375, 6682, 6865, 6873, 6957, 6960
Childhood/Physical Illness in
 6530, 6566, 6723, 6845, 6905, 6906
Childhood/Play in (SEE Childhood/Social Behavior in)
Childhood/Preschool
 5730, 5987, 6012, 6024, 6032, 6034, 6039, 6053, 6056, 6057, 6061, 6071, 6089, 6090, 6091, 6094, 6590, 6682, 6889, 6915, 6962, 6976, 6977, 7035, 7069, 7085, 7090
Childhood/Psychosis in
 5980, 6656
Childhood/Psychotherapy (SEE Psychotherapy/Children)
Childhood/Retarded (SEE Mental Retardation)
Childhood/Schizophrenia in (SEE Schizophrenia/Childhood)
Childhood/Social Behavior in
 5981, 5984, 6008, 6064, 6085, 6086, 6087, 6088, 6089, 6090, 6129, 6179, 6391, 6497, 6566, 7077
Chlordiazepoxide (SEE Tranquilizer)
Chlorpromazine
 5805, 5811, 6509, 6527, 6546, 6749, 6892
Choice Behavior (see also Decision Making, Learning/Probability)
 5281, 5286, 5442, 5446, 5524, 5565, 5567, 5573, 6548, 6055, 6071, 6138, 6178, 6201, 6206, 6227
Chromosome (SEE Genetics)
City (SEE Urban & Suburban Environment)
Civil Rights (SEE Social Movements, Integration, Law)
Class (SEE Social Structure, Socioeconomic Status)
Classical Conditioning (SEE Conditioning/Classical)
Classification (see also Selection, Categorical Behavior)
 5212, 5287, 5372, 5506, 5507, 5517, 5557, 5737, 6051, 6276, 6403, 6585, 6634, 6666, 6706, 6729, 6983, 7116
Classroom (see also Education, School, Teaching)
 6864, 6936, 6942, 6965, 7040, 7065, 7078
Cleft Lip & Palate (SEE Speech/Defective)
Clergy (SEE Religion)
Client-Centered Therapy (SEE Psychotherapy/Methods in)
Climate (SEE Environment, Temperature)
Clinic (see also Community Services, Hospital, Treatment/Outpatient)
 6097, 6395, 6453, 6565, 6669, 6732, 6915, 6928, 7025
Clinical Judgment (see also Psychodiagnosis)
 6576, 6579, 6580, 6582, 6583, 6585, 6588, 6591, 6595, 6598, 6600, 6634, 6685, 6774
Clinical Psychology
 6385, 6391, 6402, 6410, 6411, 6420, 6431, 6435, 6767
Cluster Analysis (SEE Factor Analysis, Statistics)
Coalition Formation (SEE Group/Small)
Cochlea (SEE Ear)
Coding (SEE Categorical Behavior, Problem Solving, Display)
Cognition (see also Thinking, Categorical Behavior)
 5180, 5299, 5321, 5441, 6011, 6014, 6040, 6049, 6052, 6081, 6087, 6101, 6229, 6235, 6279, 6302, 6393, 6405, 6493, 6611, 6875, 7015, 7050, 7073
Cognitive Dissonance (SEE Attitude Change, Dissonance)
Cognitive Style
 6137, 6242, 6317, 6321, 6326, 6327, 6333, 6895, 6957
Coitus (SEE Sexual Behavior, Sexual Behavior-Animal)
Cold (SEE Temperature)
College (see also Education, School, Student/

BRIEF SUBJECT INDEX

- College)
6175, 6249, 6782, 6956, 7021, 7043, 7095
- College Counseling** (SEE Counseling, Guidance/Educational, Guidance/Vocational)
- College Student** (SEE Student/College)
- College Success** (SEE Achievement/Academic-College)
- Color** (see also Color Vision)
5348, 5575, 5895, 5926, 6034, 6074, 6118, 6369, 6813, 6820, 6835, 7060
- Color Vision**
5301, 5765, 5791, 5856, 6347
- Communication** (see also Communication/Nonverbal, Information, Language, Speech, Verbal Behavior)
5206, 5256, 5398, 5473, 5975, 5985, 6086, 6196, 6198, 6213, 6215, 6218, 6220, 6223, 6237, 6243, 6245, 6246, 6247, 6250, 6251, 6252, 6253, 6294, 6702, 6793, 6830, 6936, 7018
- Communication/Animal** (SEE Communication, Vocalization)
- Communication/Mass** (see also Television, Advertising)
6181, 6182, 6184, 6185, 6186, 6188, 6248, 6250
- Communication/Nonverbal**
6086, 6091, 6134, 6237, 6239, 6244, 6449, 6880
- Community** (see also Culture, Group)
6151, 6249, 6347, 6395, 6798, 6913, 7110
- Community Services** (see also Clinic, Mental Health)
5198, 6126, 6421, 6424, 6732, 6780, 6781, 6785, 6788, 6794, 6798, 6821, 6831, 6886, 6913, 6914, 6915, 6916, 6917, 6918, 6919, 6920, 6921, 6922, 6923, 6924, 6925, 6926, 6927, 6928, 6929, 6930
- Comparative Psychology** (see also Animal Psychology)
5875, 5876, 5877, 5878, 5879
- Competition** (see also Conflict, Cooperation, Motivation)
5210, 5443, 5571, 6015, 6117, 6193, 6219, 6232, 6315
- Complexity** (see also Cognitive Style, Stimulus)
5336, 5397, 5418, 5572, 6302, 6311, 6316, 6327, 6731
- Comprehension** (see also Thinking, Reading)
5490, 5990, 6846, 6986, 7060
- Compulsion** (SEE Obsession-Compulsion)
- Computer**
5192, 5251, 5254, 5255, 5256, 5257, 5258, 5259, 5260, 5261, 5262, 5263, 5264, 5265, 5266, 5267, 5268, 5269, 5303, 5355, 5495, 5563, 5606, 6246, 6247, 6586, 7006, 7014, 7040
- Concentration Camp** (SEE Prison, War)
- Concept** (see also Childhood/Concepts & Problem Solving in, Concept Formation, Thinking)
5182, 5189, 5191, 5500, 5556, 5559, 5560, 5561, 5562, 5564, 6058, 6409, 6411, 7050
- Concept Formation** (see also Childhood/Concepts & Problem Solving in)
5562, 5563
- Conditioned Emotional Response**
- Conditioned Galvanic Skin Response** (SEE Galvanic Skin Response)
- Conditioned Reflex** (SEE Conditioned Response, Reflex)
- Conditioned Response**
5399, 5452, 5522, 5615, 5617, 5621, 5651, 5652, 5654, 5662, 5669, 5670, 5679, 5682, 5695, 5703, 5726, 5747, 5752, 5777, 5812, 5819, 5843, 5846, 5850, 5908, 5911, 5918, 5920, 5925
- Conditioning** (see also next headings)
5407, 5454, 5480, 5617, 5643, 5651, 5695, 5908, 5909, 5911, 5919, 5921, 6003, 6310, 6903
- Conditioning/Avoidance** (SEE Learning/Avoidance, Rat/Avoidance & Avoidance Learning in)
- Conditioning/Classical**
5455, 5633, 5634, 5640, 5702, 5722, 5777, 5972
- Conditioning/Escape** (SEE Escape)
- Conditioning/Eyelid**
5380, 5920
- Conditioning/Interceptive**
5452, 5457, 5722, 5754, 5837, 5902, 6707
- Conditioning/Operant** (see also Rat/Conditioning in)
5456, 5465, 5754, 5804, 5837, 5913, 5914, 5922, 5953, 6026, 6500, 6734, 6883
- Conditioning/Verbal** (SEE Learning/Verbal)
- Conference** (SEE Symposium)
- Confidence Judgment** (SEE Certainty)
- Conflict** (see also Frustration, Learning/Avoidance, Interpersonal Processes)
5566, 5570, 5826, 5923, 5938, 5939, 6086, 6120, 6180, 6195, 6433, 6568, 6570, 6602, 6681, 6688
- Conformity** (see also Authoritarianism, Dominance, Expectation, Interpersonal Influence, Social Influence)
5279, 6136, 6140, 6195, 6197, 6199, 6201, 6329, 6951
- Congress** (SEE Symposium)
- Connotation** (SEE Meaning, Semantics)
- Conscience** (SEE Value & Values, Ethics, Motivation)
- Conscious States** (see also Awareness)
5186, 5391, 5407, 5532, 5711, 5858, 5993, 6301, 6578, 6870
- Conservation** (SEE Childhood/Concepts & Problem Solving in)
- Conservatism** (SEE Political Behavior, Personality Trait)
- Consonance** (SEE Dissonance)
- Constancy** (SEE Gestalt Psychology, Visual Perception, Perception)
- Consumer Behavior** (see also Advertising)
7154
- Contagion** (SEE Interpersonal Influence, Social Influence)
- Content** (SEE Information, Meaning)
- Context**
5300, 5513, 5527, 5934, 6038, 6234, 6236
- Contraception** (SEE Birth Control)
- Contribution & Criticism**
5207, 5271, 5276, 5307, 5309, 5377, 5414, 5415, 5416, 5450, 5452, 5465, 5523, 5560, 5561, 6047, 6120, 6169, 6171, 6181, 6182, 6184, 6185, 6188, 6296, 6297, 6299, 6332, 6353, 6374, 6379, 6402, 6410, 6801
- Control** (see also Display)
5382, 5842, 5891, 5903, 5928, 5929, 6188
- Control/Internal-External**
6077, 6079, 6084, 6305, 6320, 6325, 6890
- Convulsion** (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)
- Cooperation**
5566, 5570, 5571, 6117, 6200, 6219, 6232
- Coordination** (SEE Motor Performance)
- Coping Behavior** (SEE Adjustment/Personal & Social)
- Copulatory Behavior** (SEE Sexual Behavior-Animal)
- Correlation** (see also Factor Analysis, Statistics)
5221, 5246, 5248, 5255, 5267, 5766, 6279, 6336, 6360, 6968
- Cortex** (SEE Cerebral Cortex, Visual Cortex)
- Counseling** (see also Guidance/Educational, Guidance/Vocational, Interview)
6776, 6786, 6790, 6791, 6799, 6800, 6801, 6802, 6803, 6915, 6921, 7018, 7019, 7020, 7022, 7023, 7025, 7026, 7028, 7029, 7031, 7033
- Counseling/College** (SEE Guidance/Educational, Guidance/Vocational)
- Counselor**
6774, 6775, 6789, 6790, 6791, 6797, 6798, 6996, 7019
- Countertransference** (SEE Interpersonal Processes, Psychotherapy, Psychoanalysis, Therapeutic Process)
- Counting** (SEE Mathematics, Number)
- Court** (SEE Law, Crime & Criminals)
- Courtship** (SEE Interpersonal Attraction)
- Creativity** (see also Aesthetics, Gifted, Literature, Music, Thinking)
5190, 5273, 5558, 6078, 6243, 6298, 6338, 6339, 6340, 6341, 6342, 6343, 6348, 6375, 6657, 7036, 7062, 7077, 7118
- Credibility** (SEE Experimentation & Experiments, Interpersonal Influence, Social Perception)
- Crime & Criminals** (see also Delinquency/Juvenile, Law, Prison)
6392, 6480, 6560, 6564, 6626, 6627, 6628, 6630, 6632, 6693
- Crisis & Crisis Intervention** (see also Community Services, Emotion)
6207, 6413, 6504, 6562, 6653, 6800, 6803, 6917, 6923, 6929, 6934
- Critical Flicker Fusion** (SEE Vision)
- Criticism** (SEE Contribution & Criticism)
- Cross-Cultural Differences** (see also Culture, Cultures & Countries)
6112, 6129, 6130, 6131, 6132, 6133, 6134, 6135, 6136, 6137, 6138, 6139, 6140, 6141, 6142, 6143, 6144, 6161, 6334, 6369, 6372, 6616, 6716, 7128
- Cue**
5279, 5314, 5341, 5355, 5464, 5483, 5502, 5556, 5639, 5905, 5932, 5966, 5985, 6231, 6261, 6267, 6353, 6705, 6721, 6728, 6896
- Cultural Anthropology** (SEE Culture)
- Cultural Disadvantage** (SEE Socioeconomic Status, Childhood/Disadvantaged)
- Culture** (see also Cultures & Countries, Ethnology, Social Influence)
5182, 5864, 5870, 5902, 6111, 6119, 6150, 6152, 6272, 6283, 6339, 6398, 6717, 6884, 6885, 6888, 7000, 7093
- Cultures & Countries** (see also Culture, Africa, Canada, France, Germany, Great Britain, India, Israel, Japan, Latin America, United States, USSR)
6041, 6045, 6081, 6111, 6118, 6120, 6134, 6136, 6138, 6139, 6142, 6143, 6144, 6163, 6164, 6180, 6230, 6262, 6270, 6293, 6335, 6369, 6387, 6389, 6427, 6614, 6656, 6669, 6943, 7000, 7021, 7025, 7062, 7123, 7126, 7133
- Curiosity** (SEE Motivation, Thinking)
- Curriculum** (see also School Administration, Mathematics, Reading)
5202, 6097, 6945, 6959, 6975, 7024, 7044, 7055, 7057, 7058, 7082, 7083, 7085, 7089, 7092, 7094, 7095, 7096, 7104
- Cutaneous Sense** (see also Skin)
5302, 5306, 5313, 5403, 5405, 5426, 5753, 5767, 5771, 5966, 5983, 6071, 6813, 6814, 6819, 6825, 6862, 6994, 7012, 7024
- Cybernetics** (SEE Communication, Feedback, Computer)
- Dark Adaptation** (SEE Adaptation/Sensory)
- Data Processing** (SEE Computer, Statistics)
- Day Dreaming** (SEE Fantasy)
- Deafness & Hearing Disorder**
6118, 6821, 6822, 6823, 6824, 6825, 6826, 6827, 6828, 6831, 6982
- Death** (see also Suicide)
5829, 6147, 6171, 6323, 6905
- Death Penalty** (SEE Law)
- Deception**
5279, 6278, 6346, 6668, 6881
- Decision Making** (see also Choice Behavior, Game, Learning/Probability)
5175, 5297, 5298, 5375, 5397, 5430, 5445, 5566, 5567, 5568, 5570, 5572, 6124, 6138, 6321
- Decoding** (SEE Categorical Behavior, Problem Solving, Display)
- Defecation** (SEE Elimination)
- Defense Mechanism** (see also Identification, Repression)
5859, 5866, 6116, 6291, 6384, 6485, 6572, 6668, 6708, 6806, 7151
- Defense/Perceptual** (SEE Defense Mechanism)
- Defensiveness** (SEE Defense Mechanism, Personality Trait)

BRIEF SUBJECT INDEX

Deja Vu (SEE Familiarity, Parapsychology)
Delayed Reaction (SEE Response)
Delinquency/Juvenile (see also Antisocial Behavior, Crime & Criminals)
 6415, 6464, 6633, 6634, 6635, 6636
Delirium (SEE Mental Disorder, Neurosis, Psychosis)
Delusion (SEE Mental Disorder, Neurosis, Psychosis)
Demographic Variables (SEE Population Characteristics)
Denial (SEE Defense Mechanism)
Dependency
 5245, 5448, 6137, 6292, 6312, 6322, 6326, 6333, 6415, 6485, 6611, 6636, 7072, 7081, 7156
Depression (see also Emotion, Emotional Disturbance)
 5864, 5876, 6404, 6502, 6510, 6514, 6522, 6523, 6531, 6539, 6541, 6544, 6548, 6550, 6554, 6556, 6582, 6585, 6600, 6642, 6644, 6645, 6648, 6652, 6655, 6657, 6662, 6667, 6672, 6677, 6678, 6679, 6681, 6689, 6694, 6696, 6697, 6700, 6712, 6719, 6754, 6800
Deprivation (see also Deprivation/Sensory, Food Deprivation, Isolation, Rat/Deprivation in)
 5408, 5713, 5786, 5865, 6127, 6391
Deprivation/Sensory
 5759
Depth Perception (SEE Perception/Depth)
Desegregation (SEE Integration)
Desensitization Therapy (SEE Behavior Therapy)
Detection
 5339, 5352, 5387, 5391, 5394, 5401, 5402, 5422, 5426, 5430, 5491, 5522, 5545, 5971, 6650, 6654
Developing Countries (SEE Cultures & Countries)
Development (see also Childhood/Development in, Language Development, Maturation)
 5580, 5581, 5598, 5890, 5978, 5991, 6782, 6987
Dexterity (SEE Hand, Motor Performance)
Diabetes (SEE Blood, Disease)
Diagnosis (see also Psychodiagnosis, Schizophrenia/Diagnosis of, Mental Retardation/Diagnosis of)
 6399, 6406, 6408, 6761, 6815, 6817, 6831, 6841, 6849, 6987, 6999, 7001, 7011, 7031, 7080
Diagnosis/Differential
 6533, 6592, 6594
Dial (SEE Display)
Diet (SEE Food)
Differential Reinforcement at Low Rates of Responding (SEE Reinforcement Schedule)
Digestive System (see also Metabolism)
 5633, 5644, 5652, 5819, 5852, 5861, 5867, 5868, 5869, 6847
Digit (SEE Number)
Disability (SEE Physical Handicap)
Disarmament (SEE War, International Relations)
Discrimination (see also Auditory Discrimination, Learning/Discrimination, Visual Discrimination, Rat/Discrimination in)
 5306, 5396, 5405, 5433, 5442, 5913, 5929, 6036, 7013
Discrimination Learning (SEE Learning/Discrimination)
Discrimination Reversal
 5926, 6034, 6036
Discrimination/Racial (SEE Integration, Prejudice, Social Movements)
Disease (see also Illness)
 5622, 5982, 6097, 6485, 6530, 6542, 6546, 6616, 6681, 6710, 6760, 6761, 6837, 6842, 6843, 6844, 6845, 6847, 6848, 6857, 6868
Displacement (SEE Defense Mechanism)
Display (see also Control)
 5427, 7155
Dissonance (see also Attitude Change)
 6172, 6178, 6183, 6187, 6945, 7047
Distance (SEE Perception/Depth)

Distraction (SEE Attention)
Diurnal Rhythms (SEE Biological Rhythms)
Divorce (SEE Marital Problems)
DNA (SEE Biochemistry)
Dog
 5590, 5615, 5640, 5652, 5654, 5669, 5670, 5703, 5726, 5749, 5752, 5758, 5777, 5781, 5812, 5819, 5821, 5827, 5840, 5843, 5908, 5911, 5912, 5914, 5919, 5920, 5921
Dogmatism (SEE Authoritarianism, Personality Trait)
Dominance (see also Authoritarianism)
 5814, 5970, 6136, 7094
Double Blind Design (SEE Experimental Design)
Down's Syndrome (SEE Genetics, Mental Retardation)
Draft (SEE Military)
Draw-a-Man Test (SEE Projective Technique)
Draw-A-Person Test (SEE Projective Technique)
Drawing (see also Aesthetics, Creativity, Picture)
 5366, 6020, 6067, 6262, 6638
Dream & Dreaming (see also Rapid Eye Movement, Sleep)
 5495, 5788, 5876, 6052, 6281, 6326, 6483, 6682, 5896
Drinking (SEE Alcohol, Water & Water Intake)
Drive (SEE Motivation)
Driving (see also Safety)
 6006, 7156, 7157
DRL (SEE Reinforcement Schedule)
Dropout (SEE School Dropout)
Drug Addiction (see also Drug Effects, Drugs)
 6273, 6604, 6605, 6606, 6607, 6608, 6762
Drug Effects (SEE next headings, Drug Addiction)
Drug Effects-Animal (see also Rat/Drug Effects in, Cat/Drug Effects in, Drugs)
 5578, 5590, 5775, 5781, 5783, 5794, 5802, 5804, 5805, 5809, 5811, 5812, 5814, 5819, 5821, 5822, 5823, 5827, 5829, 5833
Drug Effects-Human (see also Drug Addiction, Drugs)
 5355, 5781, 5783, 5788, 5789, 5790, 5791, 5792, 5793, 5861, 5982, 6512, 6517, 6546, 6626, 6691, 6697, 6702
Drug Therapy
 5781, 5783, 6404, 6509, 6510, 6511, 6512, 6513, 6514, 6515, 6516, 6517, 6519, 6520, 6521, 6522, 6523, 6524, 6525, 6526, 6527, 6528, 6529, 6530, 6531, 6532, 6533, 6534, 6535, 6536, 6537, 6538, 6539, 6541, 6542, 6543, 6544, 6545, 6546, 6547, 6548, 6549, 6550, 6551, 6552, 6553, 6554, 6555, 6556, 6595, 6605, 6642, 6644, 6657, 6677, 6691, 6759, 6844, 6892, 6908, 6909
Drug Therapy-Schizophrenia
 6511, 6516, 6525, 6533, 6535, 6537, 6539, 6557, 6709, 6732, 6733, 6735, 6736, 6737, 6738, 6740, 6741, 6742, 6744, 6746, 6747, 6748, 6749
Drug Usage & Abuse (see also Drug Addiction, Drugs)
 6268, 6269, 6270, 6271, 6273, 6468, 6800, 6921
Drugs (see also Amphetamine, Antidepressant Drugs, Chlorpromazine, Lysergic Acid Diethylamide, Marijuana, Tranquilizer)
 5355, 6268, 6272, 6518, 6527, 6536, 6540, 6671
Dyad (SEE Group/Small, Interpersonal Processes)
Dyslexia (SEE Reading Deficiency)

Education/Adult (SEE Education)
Education/Physical
 5574, 6945, 7089, 7092, 7094
Education/Programs In
 6977, 7016, 7046, 7083, 7086, 7087, 7088, 7091
Education/Special
 6680, 6813, 6821, 6977, 6979, 6980, 6981, 6982, 6994, 6995, 6996, 6999, 7000, 7001, 7004, 7009, 7010, 7011, 7012, 7017, 7031
Education/Special-Mental Retardation (see also Mental Retardation/Learning in)
 6765, 6903, 6998, 7006, 7014
Education/Special-Remedial
 6763, 6975, 6985, 6986, 6988, 6989, 6990, 6991, 6992
Educational Background
 6022, 6118, 6139, 6207, 6332, 6663, 6667, 6941
Educational Guidance (SEE Guidance/Educational)
Educational Measurement (see also Test/Achievement)
 5272, 6964, 6965, 6966, 6967, 6968, 6970, 6972, 6973, 6975, 6976, 7025
Educational Psychology
 6603, 6943, 7043, 7104
Edwards Personal Preference Schedule (SEE Test/Personality)
Effort (SEE Work & Work Analysis)
Ego (see also Self)
 5865, 6093, 6281, 6287, 6291, 6292, 6304, 6567, 6572, 7033, 7052
Electrical Activity (see also Potential/Evoked)
 5188, 5294, 5586, 5597, 5599, 5614, 5616, 5656, 5659, 5660, 5665, 5674, 5682, 5683, 5688, 5689, 5691, 5692, 5693, 5695, 5696, 5697, 5698, 5699, 5700, 5701, 5702, 5703, 5708, 5709, 5710, 5711, 5712, 5713, 5714, 5715, 5717, 5718, 5719, 5720, 5721, 5722, 5725, 5743, 5761, 5762, 5764, 5768, 5771, 5803, 5810, 5813, 5862, 5992, 6006, 6014, 6023, 6267, 6309, 6650, 6839, 6866, 6895, 7139
Electrocardiogram (SEE Electrophysiology, Cardiovascular Processes, Heart)
Electroconvulsive Shock
 5673, 5678
Electroconvulsive Shock Therapy
 6502
Electrode (SEE Electroencephalography, Electrical Activity)
Electrodermal Response (SEE Galvanic Skin Response)
Electroencephalography (see also Arousal)
 5188, 5579, 5594, 5707, 5729, 5730, 5732, 5736, 5739, 5741, 5743, 5748, 5755, 6001, 6388, 6520, 6530, 6549, 6595, 6643, 6649, 6690, 6834, 6848, 6849, 6860, 6872, 6873, 6907
Electroencephalography-Animal
 5624, 5627, 5658, 5711, 5713, 5728, 5734, 5747, 5749, 5756, 5758, 5809, 5818, 5824, 5846, 5876
Electromyography (see also Eye Movement, Muscle)
 5504, 5579, 5627, 5690, 5704, 5713, 5743, 5841, 5866, 5920, 6858, 6859
Electrophysiology
 5291, 5601, 5679, 5693, 5694, 5696, 5707, 5718, 5729, 5734, 5740, 5845
Electroretinography (SEE Electrophysiology, Retina)
Elimination
 5408, 5584, 5774, 5790, 5859, 6515, 6519, 6555, 6662, 6690
Embedded Figures (SEE Test/Intelligence, Dependency)
Embryo (see Pregnancy)
Emotion (see also Affect, Depression)
 5176, 5321, 5417, 5420, 5422, 5558, 5982, 6008, 6078, 6128, 6146, 6234, 6239, 6274, 6298, 6301, 6318, 6358, 6414, 6417, 6485, 6528, 6554, 6566, 6581, 6654, 6685, 6806, 6812, 6870, 6955
Emotional Disturbance (see also Childhood/Emotional Disturbances in)

BRIEF SUBJECT INDEX

- 5868, 6519, 6531, 6544, 6549, 6657, 6675, 6685, 6694, 6696, 6800, 6912, 6953
Emotionality (see also **Emotion**)
 5885
Empathy (see also **Therapeutic Process**)
Employee (SEE **Personnel/Industrial**)
Encephalitis (SEE **Brain Disorder**)
Encoding (SEE **Categorical Behavior, Memory, Thinking**)
Encounter Group (SEE **Sensitivity, Psychotherapy/Group**)
Endocrine (SEE **Gland, Hormone**)
Endogenous-Exogenous Factor (SEE **Etiology**)
Engineering Psychology
 5256, 5266
Engineers & Engineering (SEE **Occupation**)
Enuresis (SEE **Elimination**)
Environment (see also **Environment-Animal, Isolation, Temperature, Deprivation/Sensory, Urban & Suburban Environment, Rural Environment**)
 5898, 6005, 6018, 6070, 6127, 6564, 6628, 6676, 6739, 6939, 7064, 7138, 7151, 7152
Environment-Animal (see also **Isolation, Deprivation/Sensory, Temperature**)
 5668, 5847, 5853, 5873, 5881, 5883, 5884
Epilepsy
 6594, 6872, 6873, 6874, 6875, 6876, 6877, 6878, 6879
Epinephrine
 5655, 5814, 6626
EPPS (SEE **Test/Personality**)
Equipment (SEE **Apparatus, Apparatus-Animal**)
Ergonomics (SEE **Engineering Psychology, Industrial Psychology**)
Error
 5223, 5275, 5280, 5312, 5403, 5449, 5553, 5931, 6027
Escape
 5305, 5407, 5684, 5797, 5912, 5935, 6830
Esthetics (SEE **Aesthetics**)
Estimation
 5223, 5227, 5229, 5246, 5248, 5250, 5265, 5275, 5309, 5310, 5335, 5367, 6222, 6714, 7030
Ethics (see also **Value & Values, Philosophy**)
 5192, 6138, 6320, 6328
Ethnology
 5998, 6070, 6085, 6121, 6142, 6154, 6164, 6165, 6216, 6230, 6616, 6663, 6669, 6969, 7064, 7072, 7086, 7087, 7088
Etiology
 6399, 6603, 6604, 6644, 6645, 6666, 6695, 6818, 6877, 6891, 6953
Eugenics (SEE **Genetics**)
Evaluation (see also **Work & Work Analysis**)
 5415, 6299, 6440, 6589, 6593, 6774, 6902, 6942, 6964, 6972, 6987, 7096, 7120, 7146
Evoked Potential (SEE **Potential/Evoked**)
Evolution (SEE **Comparative Psychology, Science, Theory**)
Examination (SEE **Educational Measurement, Test/Achievement, Test & Testing**)
Exceptional Child (SEE **Education/Special, Education/Special-Remedial, Education/Special-Mental Retardation, Gifted, Childhood/Handicapped**)
Excitation (SEE **Inhibition, Potential/Evoked, Stimulation**)
Excretion (SEE **Elimination**)
Executive (SEE **Management**)
Exercise (SEE **Work**)
Exhibitionism (SEE **Sexual Deviation**)
Existential Psychology & Psychiatry (SEE **Existentialism**)
Existentialism
 6467, 6532, 6576, 6717, 6799, 6804
Expectation & Expectancy (see also **Aspiration, Set**)
 5280, 5425, 5430, 5897, 6107, 6178, 6214, 6897, 7014, 7081, 7129
Experience (see also **Familiarity, Practice**)
 6043, 6241, 6274, 6298, 6487, 6630, 6967
Experience/Early
 5875, 5881, 5882, 5883, 5884, 5885, 5886, 5887, 5888, 5889, 5891, 5895, 5966, 5974
Experimental Design
 5209, 5232, 5243, 5278, 5281, 5596, 5924, 6181, 6182, 6184, 6185, 6186, 6188, 6352, 6854, 6855
Experimental Psychology
Experimentation & Experiments (see also **Research, Research Methods**)
 5233, 5241, 5245, 5278, 5279, 5280, 5282, 5283, 5425, 5456, 5467, 5891, 6035, 6064, 6079, 6107, 6198, 6235, 6310, 6322, 7121, 7122
Experimenter Bias (SEE **Bias, Experimentation & Experiments**)
Expert Testimony (SEE **Law, Clinical Judgment**)
Exploratory Behavior (see also **Rat/Activity in**)
 5630, 5887
Extinction (see also **Extinction/Resistance to, Inhibition, Learning, Rat/Extinction in**)
 5579, 5627, 5670, 5919, 5961
Extinction/Resistance to
 5794
Extrasensory Perception (SEE **Parapsychology**)
Extraversion-Introversion
 5542, 5861, 6218, 6293, 6294, 6297, 6301, 6312, 6313, 6363, 7056
Eye (see also **Retina, Vision**)
 5327, 5350, 5356, 5365, 5421, 5457, 5624, 5725, 5732, 5750, 5761, 5763, 5976, 5991, 6198
Eye Movement (see also **Rapid Eye Movement**)
